PEARS CYCLOPAEDIA

A book of reference and background information for everyday use

Seventy-second Edition

1963–64

Editor, L. Mary Barker, B.Sc.Lond.

ASSISTED BY TEN SPECIALIST ASSOCIATE EDITORS

The Editor desires to express her gratitude to readers for their criticisms and suggestions and to all those who in one way or another have contributed to the making of this edition. Correspondence is welcomed and should be addressed to the Editor at 'Middlemarch', Halstead, Kent.

First published 1897

Printed and Bound in Great Britain by Richard Clay and Company, Ltd., Bungay, Suffolk

To Our Readers

HAVING regard to the growing interest in drama we present a new section on modern English stage plays. Prevailing influences and tendencies are discussed and dramatists are considered individually, with a detailed scrutiny of representative plays.

Another new feature is " Background to Current Affairs ", an expansion of the section " A Citizen's Guide ", which is now in two parts. The background provides a chronicle and an analysis of some of the major events in the last two decades and it discusses a number of topics likely to be of increasing concern in the Sixties.

At a time when economics plays a crucial role in our lives the " Background to Economic Events " acquires still greater interest for those who wish to supplement their reading and listening and find out what lies behind the news. This section explains the facts of the economic situation and the terms in which those facts are expressed. Parts I and II survey the British economy up to 1960; Part III deals with developments since 1960 up to the April Budget of 1963.

The Science section is designed to impart in clear and simple language an understanding of the fundamental principles of science and to give a picture of contemporary scientific achievement. In the part dealing with recent discoveries and developments eminent scientists tell of some of the important and fascinating subjects with which they deal—space research, radio astronomy, weather forecasting, biological clocks, the genetic code, and optical masers.

Some interesting population pyramids with explanatory text are to be found at the end of the Gazetteer.

Plan of Volume

This book of reference is divided into sections which fall into three main groups:—

Contents

I. THE WIDER WORLD

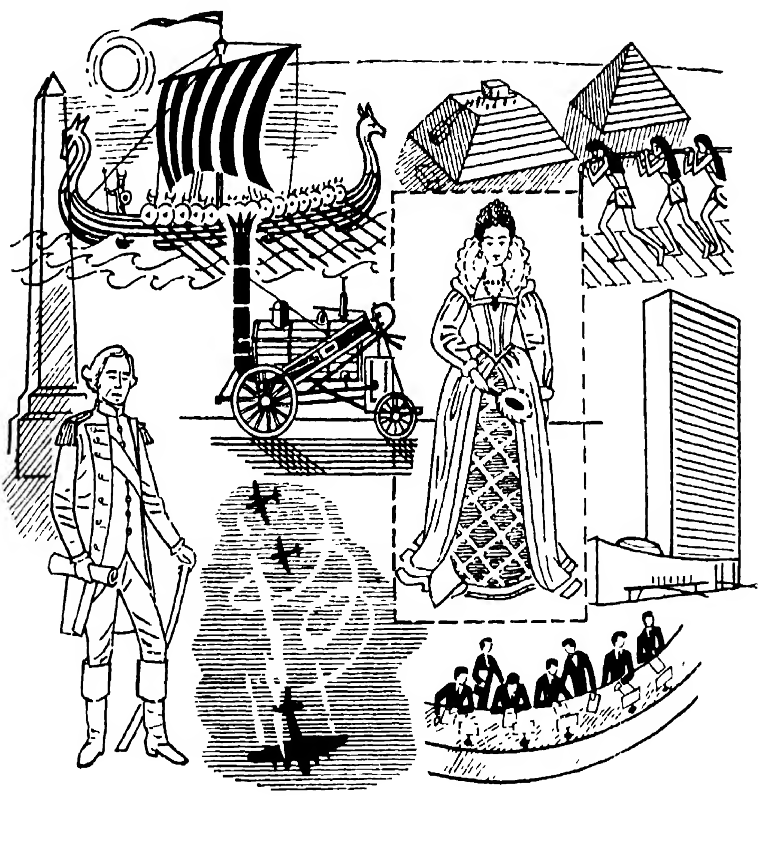
II. GENERAL

III. HOME AND SOCIAL

Index

Some of the sections are alphabetically arranged and consequently self-indexing. Their contents are not indexed here except where it is anticipated some special difficulty in reference may arise. Each section has a letter and, where appropriate, the column is given in brackets after the page number, *e.g.*, F8(1), G40(2). Where the contents of a section are not alphabetically arranged, a Table of Contents will be found at the beginning of the section. The sections "Greek Myths and Legends" and "Medical Matters" have each a separate index and glossary.

Historical Events



Setting forth in chronological order important and famous events in the history of the world

Chronicle of Events

Note.—*For classical history and for the past millennium most dates are well established. For other periods there is sometimes considerable uncertainty. Many of the dates in ancient history are either dubious or approximate, sometimes both. For events in prehistory the reader may find it helpful to consult the Geological Time Scale and the sub-section Earliest Men in Part II of the Science Section.*

PREHISTORY

B.C.	
5,300,000,000	Age of Earth.
3,300,000,000	Earliest known rocks (found in Rhodesia and Manitoba).
2,000,000,000	Life appears.
600,000,000	First large-scale occurrence of fossils.
20,000,000	Early ape fossils (Miocene period—*Proconsul*, E. Africa)
10,000,000	Early ape fossils (Lower Pliocene —*Oreopithecus*, Italy).
1,700,000	Earliest known hominids (Lower Pleistocene—*Australopithecus*, S. Africa and *Zinjanthropus*, E. Africa.) "Pebble Culture"—first stage of Palaeolithic or Old Stone Age (hunting and food-gathering) which persisted until end of Ice Age, *c* 8,000 B C.
400,000	*Pithecanthropus* stage (Java, China) with crude chopping tools. Transitional stage between *Pithecanthropus* and *Homo* (E. Africa) with early hand-axes. Heidelberg jaw (Europe)
250,000	Atlanthropus (N. Africa) with advanced hand-axes Early representatives of *Homo* (Europe: Steinheim and Swanscombe).
100,000	Neandertalers (Europe, Asia, N. Africa). Rhodesian Man (S. Africa) Solo Man (Java) Flake tools
40,000	First cold phase ends. Neandertal race becoming extinct.
30,000	Second cold phase. *Homo sapiens* (Modern Man) Implements show significant advances: small knife-blades, engraving tools. Paintings and sculpture, magic rites and ceremonies. Cro-Magnons with Aurignacian culture
18,000	Main advance of the ice-sheets. Aurignacian culture dying out to be replaced by Solutrean and then by the Magdalenian cultures. Great flowering of Palaeolithic art.
10,000	First immigrants from Asia to cross Behring Straits.
8,000	Ice finally retreats.
7,000	Neolithic revolution in Middle East. Agricultural settlements (*e g.*, Jericho). Settled way of life leading eventually to such skills as weaving, metallurgy; inventions as ox-drawn plough, wheeled cart.
5,000	Britain becomes an island (land connection with continent severed by melting ice-sheets).

B.C. CIVILISATION IN THE MIDDLE EAST

5000 Earliest settlements in Egypt and Mesopotamia.

4000 Susa founded.

3500 Sumerian civilisation flourishes. Cuneiform writing

Conservatives (Mr Diefenbaker) won Canadian general election by small majority; **23** Cease-fire in Laos. **24** Opening of Punjabi University, India. **27** Pilkington Report published. **28** U N called for more liberal constitution for S Rhodesia

July 1 Burundi and Rwanda became independent; After 132 years French colonial rule in Algeria ended. Commonwealth Immigrants Act came into force. **3** Plan for British national theatre and opera house accepted by L C C and Government. **5** Independence celebrated in Algeria. **8** Pres de Gaulle and Chan Adenauer attended Mass in Rheims cathedral. **9** Opening of Cairo economic conference. **10** *Telstar*, first experimental satellite in space communication, launched—first live television between U S and Europe; **20** Death of G M Trevelyan, the historian; **25** Opening of new civic centre at Plymouth; **26** Government announce setting up of "Nicky". **30** Archbishop of Canterbury visited Moscow. **31** Rendezvous of U S nuclear submarines at North Pole

August 1 Thor missile bases in Britain to be closed 1963; **5** Russia began series of atmospheric nuclear tests. Death of Marilyn Monroe, at age 36; **5** Jamaica became independent. **10** Abandonment of *Blue Water* missile. **11** British mountaineers scaled Russia's highest peak (Mt. Communism). **11** and **12** Russia launched two men into orbit (64 orbits and 48 orbits); **13** British travel allowances further eased from £250 a year to £250 a journey. **14** Completion of Mont Blanc tunnel (7¼ m); **15** Agreement on New Guinea signed · U N to administer until transfer to Indonesia on 1 May 1963. **17** Pres Kennedy's, Bill on medical care rejected by Senate; **19** New radiation belt created by U S high altitude nuclear tests may create danger for manned space flights; **20** Government approval for construction of new underground railway between Victoria and Walthamstow; **21** Maiden voyage of *Savannah*, world's first nuclear-powered merchant ship; **27** U S. *Mariner II* launched towards Venus; **31** Trinidad and Tobago became independent

September 1 Earthquake disaster in Iran; **3** Opening of Trans-Canada highway (4,800 m. from St John's, Newfoundland, to Victoria, B C). **4** Gen de Gaulle left on state visit to W Germany. **6** Agreement on Italo-American space research collaboration; **7** Life presidency for Dr Nkrumah; **8** Meeting of British and Commonwealth Labour leaders opposition to Britain's entry into Common Market on existing terms. **10** Conference of Commonwealth Prime Ministers opened in London. Britain free to resume negotiations with Common Market countries. **15** In exchange of Notes Iran assured Russia that no foreign rocket bases would be permitted. **20** Zimbabwe African People's Union banned in S Rhodesia; Fighting between Chinese and Indian troops on disputed N E frontier. **27** Overthrow of Imamate and republic proclaimed in Yemen. **29** Canada launched her first satellite, the *Alouette*, into orbit. **30** U.S. troops enforced Fed Government's order that Negro student should enrol at Mississippi State University

October 3 One-day rail strike in Britain; 6-orbit flight of U S. astronaut. **9** Uganda became independent. **11** 21st Oecumenical Council opened at St Peter's, Rome; **16** State visit to Scotland of King Olav of Norway. **17** Opening of Hyde Park Corner underpass. Electricity for national grid generated at Dounreay reactor. **24** Commencement of U S naval quarantine of Cuba. **28** Dismantling of missile base in Cuba agreed upon by Russia; Gen. de Gaulle won referendum for his proposal for direct election of President

November 1 Russia sent spacecraft on 7-month journey to Mars. **5** U K. appointed its first woman ambassador. **6** Admiralty announced record ocean depth by H M S *Cook* in Mindanao trench (37,782 ft). Opening of Commonwealth Institute (replaces Imperial Institute, S. Kensington). **12** Nyasaland constitutional conference opened agreement on new constitution not later than Feb 1963. **14** Six-year Anglo-Japanese Treaty of Commerce, Establishment and Navigation signed. **18** Death of Niels Bohr. **20** Cuba blockade ended. **21** Cease-fire declaration by China on Sino-Indian border dispute (no further hostilities occurred after this date). **29** Announcement of new Indo-Pakistan negotiations on Kashmir. **30** U Thant unanimously elected Sec -Gen. of U N.

December 5 Soviet-American space research cooperation agreement. Uprising in British prot of Brunei in protest to joining Fed of Malaysia; Dr Adenauer to resign as Fed German Chancellor in autumn 1963. British nuclear device exploded underground in Nevada. **8** Oecumenical Council adjourned until Sept 1963; **9** Tanganyika became republic and Dr. Julius Nyerere its first president. **12** British troops in control of Brunei uprising. **14** Signals from *Mariner II* as it passed within 21,000 miles of Venus. Eritrea became province of Ethiopia. N Rhodesia's first African dominated government formed. **15** Sir Edgar Whitehead's party lost to right-wing party in S. Rhodesian general election. **17** Mr Macmillan left for meeting with Pres Kennedy at Nassau, Bahamas. **19** Government decision that Nyasaland has right to leave Rhodesian Fed . **20** Number of unemployed in Britain highest since 1948; **21** U S decision to abandon *Skybolt*; offer of *Polaris* missiles for British submarines to form part of multilateral Nato nuclear force; **23** M. Fedorenko succeeded M. Zorin as Soviet perm. rep at U N ; **25** Europe snowbound with freezing temperatures. **28** U N. forces ordered to "take all necessary action to restore order" in Katanga; Agreement in principle reached between China and Pakistan defining mutual boundary; **29** Southern England swept by blizzard; **30** Worst snowstorms in England since 1881; **31** British Transport Commission replaced by British Railways Board (created by Transport Act, 1962), with Dr. Beeching as chairman

The Changing Scene: 1962–63

WE moved into 1963 shaken by one or two political earthquakes and enduring one of the hardest winters Britain has ever had.

The world had come to the brink of nuclear war by a quarrel between the United States and Russia over Cuba, and the fate of the world was suspended for a critical week in October 1962 from the decisions of two men. Some felt that the two powerful protagonists, after a solution of the dispute, would use their second chance to build up better relations. Others seemed only confirmed in their view that a crisis of this kind was inherent in a cold war. The sudden storm had shed a blinding light and it shocked people into salutary debate

U Thant's courageous handling of the incident was a factor in his election soon afterwards as Secretary-General of the United Nations. Britain had not been consulted by the United States before she took action nor was the dispute put to the United Nations for solution. But U Thant, acting Sectretary-General since the death of Dr. Hammarskjold, took up immediately the role of mediator and he and the United Nations emerged from the dispute with great credit.

There were some dramatic changes in the world scene. The ideological differences between China and Russia became more open The dispute between India and China was another shock and an all-round tragedy, bringing discordancy not only to those countries but to Pakistan, to Russia, and elsewhere The hope of unity in Asia was set back China, of course, is excluded from a United Nations which could have been well expected to deal with a frontier dispute, and the world paid an inordinate price in bitterness for the exclusion of China—a mistake so great and of such long standing that there is a risk of our being no longer able to appreciate its folly.

At the opening of 1963 we were still without any agreement on the banning of nuclear testing. Russia and America, both of whom have sufficient capacity to destroy each other, had resumed testing, Russia first in 1961, breaking a three-year moratorium, and in 1962 the United States The explosion by the U S. Atomic Energy Commission of a thermo-nuclear bomb at a height of 250 miles in July aroused protest from scientists all over the world. The radiations given off put several satellites out of action as a result of damage to their solar power supply

Nor was there any progress on disarmament The struggles of countries to keep up in the nuclear race was a painful spectacle, especially for that half of the world living in sight of starvation and penury Great Britain had its own particular problem. After scrapping in mid-development over the last few years a number of nuclear devices we were informed that the United States did not propose to continue with the Skybolt project, which we had been expecting to receive for use in our bombers We were promised, instead, some years hence, the Polaris missile for use in submarines The question was reopened as to whether it was really practicable or even desirable for Britain to have a so-called independent deterrent.

Space acrobatics continued to dazzle Colonel John Glenn in February 1962 became the first American to orbit the world, circling it three times Six months later the Russian pair, Popovich and Nikolayev, circled the earth within a few miles of each other (48 and 68 times round respectively) The American Telstar went into orbit in July and the first television picture to be transmitted direct from America via space appeared on British screens On 14 December the American space probe, Mariner II, passed within 21,600 miles of Venus and provided new data about the planet The surface temperature was found to be too hot to support life as we know it

But doubts about space probing increased. The West had declared that a full life on earth was a principal aim. It was not as if the poorer countries were advancing steadily, on the contrary, the stark reality was that they were sliding to unprecedented poverty and strangulation by their own numbers.

The rich powers continued to give aid to developing countries and indeed increased their assistance. By 1961 Great Britain was giving £162 million a year. It was a lot of money—rather less than one-seventh as much as was spent on tobacco.

By the beginning of January 1963 it looked as if the negotiations upon Britain's application to join the Common Market might peter out with a whimper, but before the month was up they ended with a bang, General de Gaulle slamming the door against us

At their Party conference in the autumn of 1962 the Conservatives came out enthusiastically for British membership, and the Liberal conference confirmed that Party's support which had been long standing The Labour Party conference generally adopted the view that it would be a mistake for Britain to go in on the terms which the Six were offering. There was disagreement by some within each of the two main Parties. The doubts of the electorate could fairly be inferred from the fall in Government popularity as shown at by-elections.

The beginning of this fall in popularity coincided with the "pay pause" early in 1962, the general view being that, whatever the merits of that policy, it was not handled with skill, nurses particularly attracting public sympathy Two new bodies, the National Economic Development Council (to plan Britain's economic growth) and the National Incomes Commission (to determine the level of wages and salaries) came into being. Neither has the power to enforce its decisions on Industry or the Government

The new Coventry Cathedral was consecrated during 1962 It brought us a major musical event Benjamin Britten's *War Requiem*, a work of large-scale construction and prodigious fertility of invention The Tate Gallery in London staged an exhibition of the paintings of Kokoschka, aged 76, and we could be very proud that this great Austrian artist had become a citizen of this country.

Satire, which had proved so popular when used as the main relish of a revue, became the mainstay of a new periodical and a private cabaret theatre; and eventually penetrated, as a permanent feature, to B.B.C television This effervescent stream was a tonic in a humourless world. It was agreeable to see pretension being pricked and pomposity punctured In some way this burst of satire was related to an increase in political cynicism Will the new satire, we wonder, be content with a raillery of sadistic sallies or will it mature into a penetrating ridicule which has a positive and creative purpose?

This satire was part of the growing self-questioning which marked contemporary English thought and was the basis of the B.B.C. Reith lectures by Professor Carstairs in 1962. While those lectures were being given a Government White Paper, surveying social changes in Britain in the last decade, emptied a load of depressing data over our heads. The amount of gambling was said to be stupendous, and it was not much consolation for the simple citizen to reflect that we had been officially encouraged to gamble, even incited to it. We had become a nation of debtors, we grasped after unearned wealth, a strong flood of violence among youngsters had swept in "since television began." Every time we looked up repentantly for a crumb of approval we were scolded. Cinemas had been converted to bowling alleys or bingo parlours. Then we remembered the new interests which had grown up in recent years—mountaineering clubs doubled in number; a rapid rise in yachting clubs and clubs for gliding and canoeing and similar outdoor activities—opportunities which scarcely existed at all a few years back. Sales of gramophone records had gone up ten per cent over the previous year, and reading had become a more widely accepted habit despite (or, perhaps, because of) the telly and the radio. If it was a bingo age it was a paper-back book age, too. More people were pondering the issues of the Sixties and thinking more deeply than might appear.

Prominent People

Lives and leading achievements of distinguished men and women of all ages and countries

Prominent People

Abbot, George (1562–1633), Archbishop of Canterbury in 1611, and one of the translators of the authorised version of the Bible.

Abdullah ibn Husein (1882–1951); King of Jordan; made ruler under the British mandate in 1921 and proclaimed King in 1946 when Transjordan (renamed Hashimite Kingdom of the Jordan in 1949) was created an independent state by treaty with Britain. Assassinated.

Abelard, Peter (1079–1142), one of the most influential thinkers of the mediaeval world, b near Nantes, pupil of Roscelin and William of Champeaux. Living in age of great theological controversy he applied his creative and versatile mind to the problem of Christian faith and held that goodness depends upon intention and free choice. Unrivalled as a dialectician, he acquired great popularity as a teacher and attained great scholastic glory His romance with Heloise, niece of Canon Fulbert, has been much written about. The Canon had Abelard castrated and they retired from the world, he to the monastery at St Denis and she to a nunnery at Argenteuil Their bodies lie in one tomb at Père la Chaise.

Abercrombie, Lascelles (1881–1938), English poet and critic Professor of English Literature at London University, 1929–35; Lecturer in Poetry at Queen's University, Belfast, 1931–32.

Abercrombie, Sir (Leslie) Patrick, M.A , F S A. F.R.I.B.A. (1879–1957), architect and town-planner. Brother of the above Lever Prof. of Civic Design at Liverpool, 1915–35. Prof of Town Planning at University College, London, 1935–46. Consulted on the replanning of Plymouth, Hull, Bath, the Clyde Valley, Dublin, Addis Ababa, Colombo, and Cyprus Produced the famous plan for Greater London, 1943

Acheson, Dean Gooderham, A B , LL B (b 1893), U.S. Secretary of State in the Truman Administration, 1949–52. Appointed 1961 to advise Sec. of State Dean Rusk on American policy in regard to Nato.

Acton, John Emerich Edward Dalberg, 1st Baron, K C V O , D C L , LL.D. (1834–1902), English historian and brilliant scholar. Professor of Modern History at Cambridge, 1895–1902

Adam, Robert (1728–1792), one of four Scottish brothers, all distinguished architects. Developed a characteristic style in planning and decoration and designed many important public and private buildings and interiors. His achievements include the great aristocratic houses of Harewood, Yorks; Osterley, Middlesex; Syon, Middlesex; Kedleston, Derbyshire

Adams, John (1735–1826), succeeded Washington as President of the United States, and was the first of the Republic's ambassadors to England.

Adams, John Couch, F.R.S. (1819–92), English mathematician and astronomer Shared credit for discovery of the planet Neptune, 1846, with the French astronomer, Leverrier (1811–77).

Adams, Samuel (1722–1803), American statesman, known as the "American Cato," who worked all his life for American Independence and signed the Declaration (1776). He organised the "Boston Tea Party."

Addams, Jane, B A., M.A (1860–1935), famous American sociologist who founded Hull House, Chicago, in 1889.

Addison, Christopher, 1st Viscount, K.G. P.C. M.D., F.R.C.S. (1869–1951). After joining the Labour Party held successive Ministerial offices in 3 Labour Governments and became leader of the House of Lords. Forsook his profession as professor of anatomy at Sheffield Univ. for a political career because of his great interest in public health and social reform.

Addison, Joseph (1672–1719), achieved fame both as a writer and a politician. Held many offices under various governments; contributed to the *Tatler* started by his friend Steele and with him founded the *Spectator*.

Adeler, Max (1841–1915), the famous American humorist who wrote, among other works, *Out of the Hurly Burly* (1874) and *Elbow Room*.

Adenauer, Dr. Konrad (b. 1876), Chairman of the Christian Democratic Union and its founder in 1945, Chancellor of the West German Federal Republic since 1949.

Adler, Alfred (1870–1937), Austrian physician and psychiatrist and founder of the school of individual psychology. An earlier pupil of Freud, he broke away in 1911, rejecting the emphasis on sex, and regarding man's main problem as a struggle for power to compensate for feelings of inferiority. (*See* **Section J.**)

Adrian IV, Nicholas Breakspear (d 1159), pope (1154–59), the only English pope, b near St. Albans Crowned Frederick Barbarossa as German emperor Granted overlordship of Ireland to Henry II which started a dispute which raged for 800 years

Adrian, Edgar Douglas, 1st Baron, O M , M A , M.D., F.R S , F R C P. (b 1889), Prof. of Physiology, Cambridge Univ. 1937–51; Master of Trinity Coll., Cambridge, 1951, Pres. of the Royal Society 1950–55, Pres of the British Association, 1954, Chancellor of Leicester University, 1958 Trustee of Rockefeller Institute, 1962 Nobel Prize for Medicine, 1932

Æschylus (525–456 B C), father of Greek tragic drama. Composed seventy plays and gained the prize for dramatic excellence thirteen times

Æsop, name famous for the fables preserved principally through Babrius (2nd century A.D.). About him nothing is known, according to legend he was a Greek slave in the 6th century B C who had a number of wild adventures.

Aga Khan, Sultan Sir Mahomed Shah, P.C , G.C S I , G C.M G , G C I E., G.C V O. (1877–1957), spiritual head of the Ismailis, an Islamic sect scattered over Asia and Africa Direct descendant of the prophet Mohammed and third holder of the title "Aga Khan" He was a great lover of the turf, and was the owner of five Derby winners. Succeeded by his grandson, Prince Karim (b 1936)

Agassiz, (Jean) Louis (Rodolphe) (1807–73), Swiss-American zoologist and geologist Author of *Researches on Fossil Fishes* (1833–43), and *Studies on Glaciers* (1840) He was an opponent of Darwin

Agricola, Gnæus Julius (A D. 37–93), became Roman Consul of Britain A D. 78 Strengthened the power of the Romans in this country, corrected many abuses, and did much to encourage trade and industry. Remained in Britain 7 years.

Agrippa, Marcus Vipsanius (63–12 B C), the greatest military commander of Rome after Julius Cæsar.

Aird, Sir John, Bart. (1833–1911), contracting engineer of eminence, associated with many great undertakings in different parts of the world, the Aswan Dam on the Nile, completed in 1902, being one of his achievements

Airy, Sir George Biddell, K.C.B., F R.S. (1801–1892), Astronomer Royal (1835–1881) at Greenwich Observatory, where his brilliance and industry led to many important researches.

Akbar, Jalal-ud-din Mohammed (1542–1605), the greatest and wisest of the Mogul emperors and one of the great figures of history. He initiated economic and social reforms and succeeded in unifying his vast empire. His courts at Delhi and Agra were centres of culture and learning.

Alanbrooke, Field-Marshal Viscount, K.G., G.C.B., O.M., G.C.V.O., D.S.O. (b. 1883). Chief of Imperial General Staff, 1941–46; Chan. Queen's Univ., Belfast. Pub. *Turn of the Tide* and *Triumph in the West, 1943–46* (War Diaries edited by Sir Arthur Bryant).

Alaric I (376–410), the famous chief who led the Visigoths against the Romans, and afterwards invaded both Greece and Italy. He took Rome in 410, died the following year, and was buried with a vast treasure in the bed of the River Busento, and so that the Romans might not discover his remains, the slaves who buried him were put to death.

Alban, St., who flourished in the latter part of the 3rd century, was born at Verulamium (where St. Albans now stands) and served as a soldier under Diocletian at Rome. Later he was converted to Christianity, and was for a time a renowned preacher of that religion, finally suffering martyrdom. Offa, king of the Mercians, built a monastery to his memory near Verulamium, four or five hundred years later. St. Alban's Day in the Calendar of the Roman Church is June 22nd, and in that of the Anglican Church June 17th.

Albani, Madame (1852–1930), stage name of Marie Louise Emma Lajeunesse, Canadian operatic soprano. Made her first appearance in England at Covent Garden in 1872 and was for many years a leading prima donna, achieving great celebrity as Elsa in *Lohengrin*.

Albert, Prince Francis Augustus Charles Emmanuel, Consort of Queen Victoria (1819–1861). On his marriage with the Queen in 1840 Parliament granted him an income of £30,000 a year. The prince adapted himself with considerable success to the difficulties of his position, and gradually secured the confidence and esteem of statesmen and public alike. The great Exhibition of 1851 owed much of its success to his efforts. He died of typhoid fever in December, 1861. The Albert Memorial forms a national tribute to his memory.

Albertus Magnus, St. (1206–80), Dominican scholastic philosopher, b. Bavaria, one of the great mediaeval university teachers and the most learned man of his time. St Thomas Aquinas was his favourite pupil. Took scientific interest in nature and made notable botanical observations.

Alcibiades (*c.* 450–404 B.C.), treacherously killed in battle at Melissa, Phrygia, was the celebrated Athenian statesman and general, pupil and friend of Socrates.

Alcock, Sir Walter Galpin, M.V.O., Mus. Doc., F.R.C.O. (1861–1947), English musician, eminent both as organist and composer of church music. He played at the Coronations of King Edward VII, King George V and King George VI. Organist to Salisbury Cathedral, 1916–47, and Professor of Organ at Royal College of Music, 1893–1939.

Alcott, Louisa May (1832–88), American authoress, the charm and naturalness of her writings made her a favourite among children's authors, and her books are still read on both sides of the Atlantic. Her most famous book, *Little Women*, appeared in 1868.

Alcuin (735–804), scholar and ecclesiastic, was a leader of the Carolingian Renaissance. His works include poems and historical and theological writings.

Aldred (d. 1069), a powerful ecclesiastic of the 11th century in great favour with the Conqueror, whom he crowned. Bishop of Worcester (1044–60), and Archbishop of York (1060–1069).

Alekhine, Dr. (Aljechin) Alexander (1892–1946), world chess champion, 1927–35, 1937–46.

Alembert, Jean le Rond d' (1717–1783), a Parisian mathematician and philosopher who achieved great eminence by his numerous scientific works, including the *Theory of the Winds* and the *Precession of the Equinoxes*.

Alexander of Hillsborough, Earl, P.C., C.H. (b. 1885). Leader of the Labour peers in House of Lords since 1955. Min. of Defence, 1946–50. First Lord of the Admiralty, 1929–31, 1940–45, 1945–46.

Alexander of Tunis, Field-Marshal Earl, P.C., K.G., G.C.B., O.M., G.C.M.G., D.S.O. (b. 1891). Comm. 1st Div. at Dunkirk; C.-in-C. Southern Command, 1940–42. G.O.C. in Burma, 1942, when he conducted a masterly retreat; C.-in-C. Middle East, 1942–43, when he was largely responsible for driving the enemy out of North Africa. C.-in-C. Allied Armies in Italy, 1944; and Supreme Allied Commander, Mediterranean, 1944–45, when he successfully led a force drawn from many different nations. Gov.-Gen. of Canada, 1946–52; Min. of Defence, 1952–54.

Alexander II. of Russia (1818–1881), succeeded his father, the Emperor Nicholas, in 1855. In 1861 he emancipated 23 millions of serfs. On March 13, 1881, was assassinated by bombs thrown beneath his carriage in St. Petersburg by Nihilists.

Alexander the Great (356–323 B.C.). King of Macedon, succeeded his father Philip in 336 B.C., and from the first showed himself fitted for mighty military exploits. He conquered in turn the Thebans, the Persian Satraps, overthrew Darius, overran Syria and Phœnicia, possessed himself of all the cities along the Mediterranean, conquered Egypt, founded Alexandria, and finally retired upon Babylon, where he died eleven days later.

Alexandra, Queen (1844–1925), d. of Christian IX. of Denmark, married to the Prince of Wales (afterwards Edward VII.) on March 10, 1863. Queen from Jan. 22, 1901, to May 6, 1910.

Alfieri, Count Vittorio (1749–1803), the Italian poet, was the author of twenty-one tragedies and six comedies.

Alfonso the Wise (1221–1284), a celebrated King of León and Castile, founder of the legal code which became the basis of Spanish jurisprudence, a liberal patron of literature and science, particularly of astronomy, dethroned by his son Sancho in 1282.

Alfred the Great (849–99), king of Wessex, son of Aethelwulf, succeeded his brother as king in 871 and found himself in conflict with the Danes from the outset. After years of effort he won decisive battle of Ethandum (Edington), 878. He prepared for further attacks by the Danes by building ships, fortifications, and by reorganising the militia or *fyrd*, defensive measures which eventually withstood the invading forces. Besides being a great warrior, a very able legislator and administrator, he was also a man of letters and responsible in great measure for the revival of English scholarship.

Allenby, Field-Marshal Viscount, G.C.B., G.C.M.G., G.C.V.O. (1861–1936), brilliant cavalry soldier. Served on Western front, 1914–16, commanded in Palestine, 1917–18, capturing Jerusalem on December 9th, 1917. High Commissioner for Egypt, 1919–25.

Alleyne, Edward (1566–1626), a famous actor, contemporary of Shakespeare and founder of Dulwich College.

Alma-Tadema, Sir Lawrence, O.M., R.A. (1836–1912), the son of a Netherlands notary, he came to England in 1869, where he soon made a name for himself as a painter of classical pictures of great beauty of colour and delicate design.

Ampère, André Marie (1775–1836), French mathematician who devoted himself to the study of electricity and magnetism, and was the first to propound the electro-dynamic theory.

Amundsen, Captain Roald (1872–1928). Norwegian explorer, the first to navigate the North-west Passage and the first to reach the South Pole. Sailing in the fishing smack *Gjöa*, he negotiated the North-west Passage in the 3 years, 1903–6. In 1911 he sailed south in the *Fram* and reached the Pole on December 14th, 1911, a month before his English rival Scott. He failed to complete a flight across the North Pole in 1925, but succeeded the next year. He lost his life in the Arctic while attempting to rescue Nobile, who had crashed in the *Italia*.

Anacreon (*c.* 560–475 B.C.), the celebrated Greek poet whose Odes hold a high place in poetic literature.

Anaxagoras (488–428 B.C.), Greek philosopher of Ionia who came to Athens 464 B.C. He inspired Pericles and the poet Euripides with his great love of science, and is said to have been the teacher of Socrates, who, however, differed from him. His rational theories outraged religious opinion and he retired to his native Asia Minor.

Anaximander (611–547 B.C.), Greek philosopher of Miletus in Asia Minor, pupil of Thales. He was the first among the Greeks to make geographical

maps, and to speculate on the origin of the heavenly bodies; he introduced the sun-dial from Babylon or Egypt.

Andersen, Hans Christian (1805–1875), perhaps the most gifted writer of fairy tales the world has known. *Mit Livs Eventyr* (The Story of My Life) is as interesting as his fairy tales, which include *The Ugly Duckling, The Little Mermaid, The Emperor's New Clothes, The Little Match-seller.* Born and died in Denmark.

Anderson, Elizabeth Garrett, M.D. (1836–1917), one of the first English women to enter the medical profession. Practised in London for many years. In 1908–9 was Mayor of Aldeburgh, her native town, and the first woman to be a mayor.

Andrea del Sarto (1487–1531). This celebrated son of a Florentine tailor was one of the great Italian artists of his time, known as the "faultless painter." Most of the famous galleries of the world contain examples of his magnificent fresco and other painting, mainly dealing with religious subjects.

Andrée, Salomon August (1854–1897), a Swedish explorer who attempted in 1897 to reach the North Pole by balloon, but, except for a message by pigeon despatched two days after his ascent, was not heard of again until in August 1930 a Norwegian scientific expedition led by Dr. Gunnar Horn discovered the remains of the Andrée expedition on White Island. The discovery included a log-book, sketch maps and the diaries kept by Andrée. A translation of these was published in England in 1931.

Andrew, Saint, one of the apostles of Jesus, brother of Simon Peter, whose festival is observed on November 30th. He became the patron saint of Scotland in the eighth century.

Angelico, Fra (1387–1455), a famous Italian painter of religious subjects, mostly in the form of frescoes, of which the best examples are at Florence.

Angell, Sir Norman (b. 1874), author and publicist, whose works include *The Economic Chaos* and *The Peace Treaty* (1919), *The Great Illusion* (1910) and *The Money Game* (1928). Nobel Prize for Peace 1933.

Ångström, Anders Jöns (1814–74), Swedish physicist, whose life was devoted to the study of heat, magnetism and spectroscopy, and in all three he contributed greatly to scientific knowledge. The unit used for measuring the wave-length of light was named *Angstrom* in his honour

Anne, Queen (1665–1714), Queen of Great Britain and Ireland from 1702 to the time of her death, was a daughter of James II, and succeeded William III, her cousin. During her reign England, in alliance with Austria, Holland, Prussia, Savoy, and Portugal, entered upon the War of the Spanish Succession. Anne's reign has been called the Augustan Age of Britain because of the many eminent men of letters who flourished during that period She was the last of the Stuarts to occupy the British throne. The most important domestic event of her reign was the passing of the Act of Union with Scotland in 1707.

Anouilh, Jean (b. 1910), most successful contemporary playwright in France; writes in the French classical tradition of happiness, conflict, and suffering. Several plays have been translated into English, including *Roméo et Jeannette* (Fading Mansion), *Eurydice* (Point of Departure), *L'Invitation au Château* (Ring Round the Moon), and he has made a number of films, including *M. Vincent* and *Pattes Blanches.*

Anselm St. (1033–1109), Archbishop of Canterbury, was a native of Aosta, and succeeded Lanfranc as English Primate. He was in serious conflict with William Rufus on the question of ecclesiastical rights, and for a time suffered exile. Under Henry I, he regained power, making a compromise with that monarch which enabled him to carry on his theological work in comparative harmony. He died at Canterbury, and was canonised in 1494, his day being celebrated in the Roman Church on April 21st.

Anson, George, 1st Baron (1697–1762), a navigator of great eminence, whose *Voyage round the World* is still a popular book of adventure. He won many victories, obtained a peerage, rose to full Admiral's rank in the Navy, and served two terms as First Lord of the Admiralty.

Antoninus Pius (86–161), Emperor of Rome from A.D. 138 to 161, the successor of Hadrian. He governed with ability and his reign brought peace and prosperity to the empire. It was during his reign that the wall between the Forth and Clyde was built.

Antonius Marcus or **Mark Antony** (c. 83–30 B.C.), celebrated Roman Triumvir and General; a warm supporter of Cæsar; but engaged in intrigues after the latter's death, and was opposed by Brutus and Cassius. His association with the Egyptian Queen Cleopatra is the subject of Shakespeare's play. Committed suicide after defeat by Octavian.

Antony, St. (or **Anthony**) (c. 251–356), was a native of Upper Egypt, and according to his own account spent much time in conflict with the devil. He is one of the best-known saints of the Roman calendar, and his festival is on January 17th. He was believed to give relief to those who appealed to him when suffering from erysipelas, from which tradition the name St Anthony's Fire is given to the disease.

Apelles, Greek painter, the most celebrated of antiquity, who flourished in the 4th century B.C. at the time of Alexander the Great. His most famous pictures, which have not survived, are of Alexander wielding the thunderbolts of Zeus and of Aphrodite rising from the sea.

Appert, Nicholas (1752–1841), sometimes known as François Appert, invented the method of preserving animal and vegetable foods by means of hermetically sealed cans or tins. He had no scientific training, but his painstaking work and countless experiments bore the mark of a true scientist. His revolutionary methods paved the way for the creation of a vast world industry which cans millions of tons of food a year.

Appleton, Sir Edward Victor, G.B.E., K.C.B., D.Sc., F.R.S. (b. 1892), physicist. From 1920 worked under Rutherford at Cambridge. His researches into the propagation of wireless waves led to a great advance in this branch of science. Awarded Nobel Prize for Physics in 1947. Pres. Brit Ass., 1953.

Apollonius of Perga (fl 220 B.C.), Greek mathematician of the Alexandrian school, remembered for his conic sections, introduced the terms *ellipse, parabola,* and *hyperbola.*

Apollonius Rhodius (fl. 250 B.C.), scholar and poet of Alexandria and Rhodes, librarian at Alexandria. He wrote on the text of Homer and is remembered for his epic *Argonautica* about the Argonaut heroes.

Aquinas, Thomas, Saint (c. 1225–74), chief scholastic philosopher whose system was ruled by Leo XIII in 1879 to be the official Catholic philosophy. He was greatly influenced by Aristotle The most important of his works are *Summa contra Gentiles* and *Summa theologica.*

Arago, Dominique Francois Jean (1786–1853), French astronomer and physicist, remembered for his discoveries in electromagnetism and optics

Archer, Frederick James ("Fred") (1857–1886), a favourite jockey for several years, winner of many leading races, his first Derby falling to him in 1877. Rode 2,748 winners during his turf career.

Archimedes (287–212 B.C.), Greek mathematician, physicist, and inventor, to whom we are indebted for his discoveries in mechanics (notably the lever), hydrostatics (floating bodies), and for the invention of the famous Archimedean screw He lived most of his life in Syracuse, and was killed there during the siege by the Romans under Marcellus.

Argand, Aimé (1755–1803), inventor of the lamp bearing his name, which for the first time introduced a current of air to permeate and increase the power of the flame, by using a chimney glass and circular wick. He was a Swiss physician.

Ariosto, Ludovico (1474–1533), one of the most celebrated of the Italian poets, author of *Orlando Furioso.* Besides this famous epic he wrote many comedies, satires, and poems.

Aristeides (or **Aristides**), a Greek writer, and founde of the school of prose romance; flourished in the 2nd century B.C. His *Milesian Tales* are among the most celebrated works of fiction.

Aristides (530–467 B.C.) the Athenian general, was of noble descent, and first achieved fame at the battle of Marathon, 490 B.C. He was renowned no less for his valour than for his scrupulous

honesty and a desire to do justice to others; hence he was surnamed "the Just."

Aristippus (c. 435–356 B.C.), founded the Cyrenaic school of philosophy, which taught that sensual pleasure was the only happiness. He was a native of Cyrene, in Africa, but became a pupil of Socrates, and settled in Athens.

Aristophanes (c. 444–c. 385 B.C.) was one of the foremost Athenian play-writers and the greatest of the Greek comic poets. He is said to have composed fifty-four plays in all. Eleven of these only have survived. They are full of satire, and deal unsparingly with the people and institutions of his time.

Aristotle (384–322 B.C.), Greek philosopher, pupil of Plato, after whose death in 347 he left Athens to become tutor to the young prince Alexander of Macedon. Subsequently at Athens he established his famous school in the garden known as the *Lyceum*, where he lectured in the *peripatos* (cloister) which gave it its name *Peripatetic*. He took the whole field of knowledge as his subject, giving it unity, and providing a philosophy which held its own for 2,000 years

Arkwright, Sir Richard (1732–1792), was a native of Preston, and in early life a barber and travelling hairdealer. Becoming interested in mechanical problems, he set himself the task of inventing an improved cotton-spinning machine. Hargreaves' spinning-jenny was then the leading machine, but the yarn it produced could only be used for weft; it was not compact enough for warp threads. Arkwright therefore experimented until, by adopting an arrangement of rollers that moved with different velocities, he succeeded in perfecting his "spinning-frame," which successfully produced a yarn that could be used for warp as well as for weft. He took out his first patent in 1769, and entering into partnership with Mr. Jehediah Strutt, of Derby, became a manufacturer on a large scale, in 1771 establishing the first spinning-mill worked by water-power

Arne, Dr. Thomas Augustine (1710–1778), English composer of considerable merit and of great popularity in his day. He composed numerous ballad operas, and at Drury Lane, Covent Garden, and Vauxhall organised the chief performances for long periods. His best-known opera was *Artaxerxes*, and his most popular songs were *Rule, Britannia!* and *Where the Bee Sucks*.

Arnold, Matthew (1822–1888), son of Dr. Thomas Arnold, achieved a high reputation as poet and critic. As the propounder of the principles of "sweetness and light," as well as by his graceful verse, he secured a high place amongst the literary men of the Victorian era

Arnold, Thomas, D.D. (1795–1842), headmaster of Rugby from 1828 to his death. His influence at Rugby was such as to give that institution a supreme position among English public schools. A man of intense spiritual feeling, of a sympathetic and lovable nature, yet possessed of all the necessary attributes of scholarship, he was greatly esteemed and venerated.

Arrhenius, Svante August (1859–1927), Swedish chemist, one of the founders of modern physical chemistry. Received 1903 Nobel Prize for originating the theory of electrolytic dissociation (ionisation) Director of the Nobel Institute, 1905–27.

Arrol, Sir William (1839–1913), well-known contractor and engineer, whose firm built the Tay, Forth, and London Tower Bridges as well as the Manchester Ship Canal. Originally a piecer in a cotton-mill, and later a working blacksmith

Artaxerxes was the name borne by several ancient Persian kings, some of whom achieved great distinction. The first Artaxerxes was the son of Xerxes, and reigned from 464 B.C. for 40 years; he was succeeded by Darius II. (424–404 B.C.), who in turn was followed by Artaxerxes II., who reigned until 358. Artaxerxes III, the last to bear the name, was a cruel and treacherous man and was poisoned in 338.

Arthur, fabled Celtic warrior of c. A.D. 600, the first reference to whom is in the 9th-cent. chronicle of Nennius, who speaks of his 12 victorious battles against the invading Saxons. His legend developed into a vast literature in mediaeval times, which was welded together by Sir Thomas Mallory in his great work *Morte d'Arthur*.

Arundel, Thomas, Archbishop of Canterbury (1353–1414), in the reigns of Richard II, and Henry IV, previously Bishop of Ely and Archbishop of York, and for a time Lord Chancellor. An active politician and bitter enemy of heresy.

Ashfield, Lord, P.C. (1874–1948), President Board of Trade, 1916–19; M.P. Ashton-under-Lyne, 1916–20; appointed first Chairman of the London Passenger Transport Board created in 1933.

Aske, Robert, the leader of the Pilgrimage of Grace, directed against the Reformation; executed 1537.

Asoka (273–232 B.C.), Emperor of India (c 255–c. 237 B.C.), and the most powerful ruler of his time, his Empire extending from the Himalayas to what is now Madras. He was the first ruler to embrace Buddhism and accord it recognition. Becoming a Buddhist (c. 257 B.C.) he turned aside in disgust from the thought of his earlier military conquests, and attempted by missionary propaganda to spread Buddhism throughout his lands. There are some 35 valuable and interesting inscriptions on rocks and pillars, etc., mainly of religious or moral import. He gave great impetus to Buddhism by organising it as the state religion.

Asquith, Herbert Henry, 1st Earl of Oxford and Asquith (1852–1928), Liberal statesman; Home Sec. in Gladstone's 1892–95 government; Chancellor of the Exchequer in Campbell-Bannerman's government; introduced first provision for old-age pensions and succeeded as Prime Minister in 1908, which office he held until 1916. Resigned leadership of Liberal Party in 1926. His second wife, Margot (Tennant) Asquith, who died in 1945, held a high position in London society for her wit and brilliance.

Asser, a Welsh monk of the tenth century, author of a remarkable life of King Alfred.

Astor, John Jacob (1763–1848), the founder of the Astor family of millionaires, was a native of Heidelberg, and emigrating to America, went out to the North-West and began trading in furs, soon building up a large fortune, which he wisely invested in New York real estate, which rapidly increased in value.

Astor, Nancy Witcher, Viscountess, C.H. (b. 1879), widow of the 2nd Viscount Astor (1879–1952). First woman M.P. to take her seat in the House of Commons, an American by birth.

Ataturk, Kemal (1881–1938), builder of modern Turkey. A fine soldier, he defended the Dardanelles against the British in 1915 and drove the Greeks out of Turkey in 1922. President of the Turkish Republic, and virtually dictator 1923–38.

Athanasius, St. (296–373), was Bishop of Alexandria. He spent much of his time in bitter theological controversy, and was driven from Alexandria; taking refuge in the desert, he wrote numerous letters in support of Christian doctrine, and under Julian was recalled to Alexandria. The Athanasian creed is supposed to reflect his belief.

Athelstan (895–940), grandson of Alfred the Great, was crowned King of England in 925, and was the first ruler of all England.

Atherstone, William Guybon (1813–98), South African geologist and an originator of the South African diamond industry. He drew attention to the possibility of diamonds near Kimberley and in 1867 identified a crystal found near the Vaal River, thus helping to start mining development. Was for many years a member of the Cape Parliament.

Attila (406–453), King of the Huns, was a warlike leader, who achieved many conquests over the Roman forces, committing great ravages and laying large tracts of country waste. He marched through Germany and Gaul, and died as he was preparing for another invasion of Italy.

Attlee, Clement Richard, 1st Earl, O.M., K.G., P.C., C.H. (b. 1883), Prime Minister in two successive Labour Governments, 1945–51, served as Deputy Prime Minister to Mr. Churchill, 1942–45. He was educated at Haileybury and University Coll., Oxford. Called to the Bar in 1905; tutor and lecturer in social science at the London School of Economics, 1913–23. Became Mayor of Stepney in 1919, Labour M.P. for Limehouse in 1922, and Parliamentary Leader of the Labour Party, 1935–55. During

his Premiership the welfare society was established and the freedom and independence of India granted. Retired in 1955; earldom conferred. His writings include an autobiography, *As it Happened* (1954), and *Empire into Commonwealth* (1960).

Auber, Daniel François Esprit (1782–1871), a distinguished French composer of light operas, *Masaniello, Fra Diavolo, Le Domino Noir*, etc.

Auchinleck, Field-Marshal Sir Claude J. E., G.C.B., G.C.I.E., D.S.O. (b. 1884), Indian Army officer who was C.-in-C. Middle East, 1941–42, and the last British C.-in-C. in India, 1943–46.

Auden, Wystan Hugh (b. 1907), influential poet and dramatist, b in England, naturalised American. Succeeded C. Day Lewis as Prof. of Poetry, Oxford Univ., 1956–61.

Auer, Leopold (1845–1930), the famous Hungarian violinist and teacher of the violin, among his pupils being Mischa Elman and Jascha Heifetz.

Augustine, Saint (354–430) the greatest of the Latin fathers, bishop of Hippo, b. at Tagaste in N. Africa of a pagan father and Christian mother (Saint Monica). He ranks high as a philosopher and his influence on Christianity has been second only to that of St. Paul. He was a voluminous writer, the most important works being his *Confessions*, the *City of God*, *On the Trinity*, and *On the Work of Monks*.

Augustine of Canterbury, Saint (d c 605), the Roman Benedictine missionary monk who was sent to Britain by Gregory the Great in 597 to convert the English peoples to Christianity He became the first archbishop of Canterbury.

Augustus, Caius Octavianus (63 B.C.–A.D. 14), Roman emperor, succeeded Julius Cæsar After a triumvirate of twelve years, in which he was associated with Mark Antony and Lepidus, he became supreme ruler and for forty-five years exercised a beneficent and powerful sway. He was a devoted patron of Horace and Virgil.

Aurelius, Marcus Antoninus. *See* **Marcus Aurelius Antoninus.**

Auriol, Vincent (b. 1884), French politician. Voted against surrender in 1940, was interned and escaped to London in 1943. President of the French National Assembly, 1946, and of the Fourth Republic, 1947–54.

Aurungzib (1618–1707), the last of the Great Moguls, Emperors of Hindustan; succeeded his father Shah Jehan in 1658 and reigned until his death. He was a ruler of ability, and greatly extended his empire by conquest, but his zeal for Mohammedanism aroused the hatred of the Hindus, and when he died the disruption of the vast Mogul territory followed rapidly.

Austen, Jane (1775–1817), author of *Emma, Mansfield Park, Northanger Abbey, Persuasion, Pride and Prejudice*, and *Sense and Sensibility* Though confining herself to the personal relations of the English middle classes, she combined artistry, accuracy, imaginative power, satiric humour, sense, and genuine feeling with the ability to create a vast range of living characters, and is often considered the most perfect English novelist.

Austin, 1st Baron, K.B.E (1866–1941), was the well-known English motor manufacturer. He was the pioneer of the small car—the 7-horse-power car—which he put on the market in 1921.

Avenzoar (Ibn Zuhr) (*c.* 1090–1162), a Moslem physician, born in Seville, the greatest of his time His chief work was the *Tasir.*

Averroës (Ibn Rushd) (1126–98), Arab philosopher and medical writer, born in Córdova, last and most famous thinker of Moslem Spain. He studied philosophy, theology, mathematics, medicine, and jurisprudence. His greatest works are his commentaries on Aristotle. He was a friend of Avenzoar.

Avicenna (980–1037) of Bokhara, Arab philosopher and physician whose *Canon of Medicine* had an enormous influence on mediaeval Europe.

Avogadro, Amedeo (1776–1856), Italian physicist, remembered for his hypothesis, since known as Avogadro's Law, that equal volumes of gases under identical conditions of temperature and pressure contain the same number of molecules.

Avon, Earl of. (*See* **Eden, R. Anthony.**)

Ayrton, William Edward, F.R.S. (1847–1908), English electrical engineer, inventor of a number of electrical measuring instruments. His first wife, **Matilda Chaplin Ayrton** (1846–83), was one of the first woman doctors and his second wife, **Hertha Ayrton** (1854–1923), became known for her scientific work on the electric arc and sand ripples and for her work for woman suffrage.

Azikiwe, Rt. Hon. Nnamdi, LL.D. (b. 1904), Pres. of the Nigerian Senate since 1960.

B

Baber or Babar (Zahir ud-din-Mahomet) (1483–1530), founder of the Mogul dynasty which ruled Northern India for three centuries, and a descendant of Tamerlane.

Bach, Johann Sebastian (1685–1750). Born at Eisenach, Germany, he became one of the greatest composers in history and has been called the father of modern music. During his appointment as organist at the Thomaskirche, Leipzig, he composed all his great devotional music, including the wonderful *St. Matthew Passion, The Passion according to St John* and the Mass in B Minor. His incessant labour affected his eyes, and in 1749 he became totally blind. His family was connected with music for seven generations, of which his was the fifth

Bach, Carl Philipp Emanuel (1714–88), third son of Johann Sebastian Bach He is important in the history of music as founder of the symphony and sonata.

Backhaus, Wilhelm (b. 1884), German pianist, recognised as one of the most gifted, especially in the interpretation of the great classical and romantic concertos. Professor of the Piano at the Royal College of Music, Manchester, 1905

Bacon, Francis, Lord Verulam, and Viscount St. Albans (1561–1626), was one of the greatest of English philosophers and statesmen, who was Attorney-General to Elizabeth, and under James I became Lord Chancellor His political career was tarnished by certain acts of corruption, for which he paid the penalty, but his writings were marked by keen insight, brilliancy of language, and a depth of thought which place them in the first rank of philosophical literature. His *Novum Organum* and his *Essays* are splendid monuments of learning and wisdom.

Bacon, Roger (1214–1294), the Franciscan friar, was a man of remarkable gifts, of great learning and inventive power In an age of darkness he was the first to insist on the importance of experiment and can claim the title of founder of experimental science Optics, explosives, engines, mechanical flight came within the range of his researches. The invention of gunpowder has been attributed to him, but without adequate evidence. For a long time he was looked upon as an alchemist and sorcerer, though of late his discoveries have been more truly appreciated.

Baden-Powell, Lt.-Gen. Lord, O M., G C M G., G C V O., K C B. (1857–1941), brilliant cavalry soldier, famous for his defence of Mafeking in the South African War. Founded the organisation of Boy Scouts (1908) and Girl Guides (1910) to promote good citizenship in the rising generation Chief Scout of the World, 1921–41

Baer, Karl Ernst von (1792–1876), Estonian biologist, founder of the science of embryology, and discoverer of the mammalian ovum.

Baffin, William (1584–1622), navigator and explorer who in 1616 discovered the bay which separates the north-east coast of British North America from Greenland, which bears his name

Bagehot, Walter (1826–77), English economist and journalist. Editor of the *Economist*, 1860–77 Wrote three books of lasting importance *The English Constitution*, 1867, *Physics and Politics*, 1872, and *Lombard Street*, a description of the Money Market, 1873. He was among the first to advocate the creation of Life Peers to strengthen the House of Lords.

Baird, John Logie (1888–1946), Scottish television pioneer; inventor of the televisor and the noctovisor.

Baker, Sir Benjamin, K.C.B., K.C.M.G., F.R.S. (1840–1907), an eminent engineer. He was consulting engineer to the Egyptian Government for the Aswan Dam, joint engineer with Sir John Fowler of the Forth Bridge, and engineer of the Central London Tube Railway.

Baker, Sir Herbert, K.C.I.E., R.A. (1862–1946) was an eminent architect who designed the

Bank of England, Rhodes House, Oxford, and, with the late Sir E. Lutyens, New Delhi.

Bakst, Léon (1868–1924), Russian painter who designed scenery and costumes for the Russian Ballet of Serge Diaghilev.

Balboa, Vasco Nuñez de (1475–1517), Spanish explorer, who was the first European to set eyes upon the Pacific Ocean. As a discoverer he ranks second only to Columbus.

Baldwin of Bewdley, 1st Earl, K.G., P.C. (1867–1947) (as Mr. Stanley Baldwin) was the leading Conservative politician between the two world wars and Prime Minister, 1923–24, 1924–29, and 1935–37.

Balewa, Alhaji Sir Abubakar Tafawa, K.B.E. (b. 1912), Prime Min of the Federation of Nigeria since independence, Oct 1960.

Balfour, Arthur James, Earl of, K.G., O.M., P.C. (1848–1930), statesman, scholar, and philosopher. Entered Parliament as a Conservative in 1874. Prime Minister, 1902–5. He also served as First Lord of the Admiralty under Asquith and as Foreign Secretary under Lloyd George. His most notable action was issuing the Balfour Declaration on Palestine

Balliol, John de, English baron whose widow in 1269 founded the college at Oxford which bears his name Fought for Henry III, against Simon de Montfort. Died in exile in 1269.

Baliol, John (1249–1315), son of the above, competed with Robert Bruce for the Scottish throne, and Edward I, decided in his favour Only reigned four years, when Edward deposed him, committing him to the Tower, and finally banished him from the country. He retired to Normandy His son, Edward Baliol, recovered his father's kingdom in 1332, and was upheld by Edward III whilst very unpopular by reason of his having given up the south of Scotland to the English He renounced his title and throne in 1356, and retired to England on an annuity.

Ball, John (d. 1381), English priest and a leader of the Peasants' Revolt, after which he was executed Author of the couplet *When Adam delved, and Eve span, Who was then the gentleman?*

Balzac, Honoré de (1799–1850), one of the greatest of French novelists, and the author of over eighty novels to which he gave the covering title of *La Comédie Humaine*, depicting the appetites and passions of the new social class born of the revolution and Napoleon

Bampton, John (1689–1751), an eminent divine, who founded the Oxford Bampton Divinity lectures

Bancroft, Sir Squire (1841–1926), one of the best-known actor-managers of the later Victorian period

Bandaranaike, Hon. Solomon West Ridgway Dias, B A (1899–1959). Socialist Prime Min of Ceylon from 1956 until his assassination in 1959 His widow, Mrs Sirimawo Bandaranaike, became Prime Min in July 1960 when the Sri Lanka Freedom Party was returned to power.

Banks, Sir Joseph, Bt., F R.S (1743–1820), was president of the Royal Society for upwards of forty years. As a naturalist he was one of the most eminent men of his time, and encouraged science in every form When Captain Cook made his voyage to the South Seas in 1768, Sir Joseph accompanied him for the purpose of observing the transit of Venus. He left very valuable botanical collections to the British Museum.

Bannister, Dr. Roger Gilbert, C.B.E. (b. 1929), British athlete who set up a new world and British record for the mile at Oxford on May 6, 1954, in 3 min 59·4 sec., the first mile ever run in under 4 min

Banting, Sir Frederick Grant, K B.E., M.C, D Sc, M.D., F.R S (1891–1941). Canadian physician and discoverer of insulin. Prof. of Medical Research, Toronto University, 1923–41.

Bantock, Sir Granville, Mus. Doc.(1868–1946). Professor of Music at Birmingham University 1908–34, Chairman of Trinity Coll of Music, London. He wrote songs, orchestral music, and much choral music.

Barbirolli, Sir John, F.R.A.M. (b. 1899), Conductor of the Hallé Orchestra since 1943. Relinquished post as permanent conductor in Sept. 1958, to become principal conductor. Succeeded Toscanini as conductor of the New York Philharmonic Symphony Orchestra, 1937–42.

Barbarossa (Red Beard), name given to **Frederick I** (c. 1122–90), greatest of the mediæval Holy Roman emperors who struggled (1159–77) to free the Empire from the domination of the Pope. The two brothers who were Barbary pirates also had this name: **Uruj** (c. 1482–1518) was killed by the Spaniards, and **Khaireddin** (c. 1482–1546) conquered Tunis for the Turks in 1534 and died in Constantinople.

Barbusse, Henri (1874–1935), noted French author and writer of the famous war novel *Le Feu*, which is one of the most remarkable and realistic of all war books, and portrays in a starkly vivid way the experience of the common soldier.

Barker, Dame Lilian, D B.E. (1874–1955), governor of the Borstal Institution for Girls at Aylesbury, 1923–35, Ass Comm of Prisons, 1936–43.

Barnardo, Dr. Thomas John (1845–1905), the founder of the well-known homes for orphan-waifs, for some forty years devoted himself to the protection, education and advancement of destitute children.

Barrie, Sir James Matthew, Bt, O.M. (1860–1937), popular Scottish author and playwright. Among his novels are *A Window in Thrums* and *The Little Minister*, while his plays include *Quality Street*, *The Admirable Crichton*, *Dear Brutus*, *Mary Rose*, *Shall We join the Ladies?* and the children's classic, *Peter Pan*. His work is clever and entertaining and is tinged with mysticism.

Barrow, Isaac (1630–1677), a famous divine, mathematician, Greek scholar, and tutor of Sir Isaac Newton. His "Sermons" are amongst the finest in the language

Barry, Sir Charles, R A. (1795–1860), architect of the Houses of Parliament at Westminster which took twenty years to build Knighted in 1852, and buried in Westminster Abbey. His son·

Barry, Sir John Wolfe Wolfe-, K C.B, F.R S. (1836–1918), an eminent engineer, designed and carried out some of the most prominent undertakings of the time, including Barry Dock and Tower Bridge.

Bartok, Bela (1881–1945), Hungarian composer and musician. Early compositions influenced by Brahms and Liszt. From an early age deeply interested in folk-song which inspired him in his researches into Hungarian and Rumanian peasant music. His compositions include string quartets, violin sonatas, concertos, orchestral music, a ballet and an opera, and a collection of over 7,000 melodies Professor at Budapest Conservatory, 1907–12, when he retired into private life as a result of the opposition his compositions aroused

Bartolommeo, Fra (1469–1517), the distinguished Florentine painter and friend of Savonarola, at whose death he became a monk.

Bartolozzi, Francesco, R A (c. 1728–1815), a Florentine engraver who came to England in 1764, and for many years was engaged upon engravings, of which he produced an enormous number, many of them of great artistic merit and highly valued by collectors to-day

Baruch, Bernard Mannes (b 1870). American economist. Assisted U S Government in both world wars, and in 1946 was chairman of the United Nations Atomic Energy Commission.

Bashkirtseff, Marie (1860–84), Russian painter and writer of a famous autobiographical diary.

Bassi, Agostino (1773–1856), Italian amateur microscopist who first suggested that infectious diseases might be caused by the invasion of the body by micro-organisms.

Bates, Herbert Ernest (b 1905), novelist and short-story writer Author of *Fair Stood the Wind for France*, *The Bride Comes to Evensford*, *The Purple Plain*, and *Jacaranda Tree*.

Batten, Jean Gardner, C.B E (b. 1909), the famous New Zealand airwoman who made aviation history by her record solo flight from England to Australia in 1934.

Baudelaire, Charles Pierre (1821–67), French poet of startling originality and great sensitivity, best known for his book of verse *Les Fleurs du Mal*, also a brilliant critic He was inordinately attached to his mother and allowed his life to be ruined by poverty, despair, and ill-health.

Bax, Sir Arnold Edward Trevor, K C V.O., F.R.C.M., F R.A.M. (1883–1953), Master of the King's Musick, 1942–52; Master of the Queen's Musick, 1952–53. His work includes numerous piano compositions, songs, and chamber works.

Baxter, Richard (1615–91), a great Nonconformist divine, remarkable for the ability and boldness of his writings. His *Saint's Everlasting Rest* is a masterpiece.

Bayard, Pierre du Terrail, Chevalier de (1475–1524), a French knight of exemplary conduct and remarkable for his chivalry. Fell at the Battle of Sesia, and was named "Le Chevalier sans peur et sans reproche."

Baylis, Lilian Mary, C.H. (d. 1937), manager of the Old Vic theatre from 1898 and of Sadler's Wells from 1931. Did great work for the British stage.

Beaconsfield, Benjamin Disraeli, Earl of, K.G., P.C. (1804–81). Son of Isaac D'Israeli (*q v.*). Statesman and novelist; with Burke (*q v.*) exercised most influence on Conservative political theories. His first novel, *Vivien Grey*, published when he was only twenty-one, was a brilliant success and the author was able to enter Society. *Coningsby* and *Sibyl*, published twenty years later, helped to rouse the social conscience to the evils of industrial life and of the deplorable relations existing between rich and poor (the "two nations"). Disraeli entered Parliament in 1837, but had only short periods of office before his terms as Prime Minister in 1868 and 1874–80. The second period was marked by the purchase of the Suez Canal shares, by the conferment on the Queen of the title, Empress of India, and by a diplomatic triumph at the Congress of Berlin, abroad, and by a continuation of measures for social reform, at home. He was a gifted orator, the rival and antithesis of Gladstone and the friend of Queen Victoria, who favoured his policies, honoured his wife, and called him "Dizzy."

Beardsley, Aubrey Vincent (1872–98), black-and-white artist, whose illustrations in the *Yellow Book* aroused much controversy.

Beatty, 1st Earl, Admiral of the Fleet, P.C., G.C.B., O.M., G.C.V.O., D.S.O. (1871–1936). First Sea Lord, 1919–27. From 1912 to 1916 Commander of Battle Cruiser Squadron. From Nov. 1916 to 1919 succeeded Lord Jellicoe as Admiral of the main British Fleet. On Aug. 28, 1914, fought the German fleet in the Heligoland Bight. On May 31, 1916, Lord Beatty with his battle cruisers was engaged in a great sea fight with the Germans off Jutland, for which he was granted £100,000 and an Earldom in 1919.

Beaumont, Francis (1584–1616), and **Fletcher, John** (1579–1625), joint authors of many plays, including *The Maid's Tragedy* and *Philaster*. Beaumont was buried in Westminster Abbey, and Fletcher interred in St. Saviour's, Southwark. Thought by some to be authors of plays attributed to Shakespeare.

Beaverbrook, Lord, P.C. (b. 1879) (William Maxwell Aitken). British newspaper proprietor and politician. A Canadian by birth and a man of tremendous energy and will-power, who rendered great service as Minister of Aircraft Production in the crucial years, 1940–41. His papers have sponsored various political campaigns, notably the Empire Free Trade Movement, and have achieved a very large circulation.

Becket, Thomas (1118?–70), saint and martyr, Archbishop of Canterbury under Henry II. A powerful and ambitious prelate who boldly supported the authority of the Pope against the dictates of the King, and was assassinated in Canterbury Cathedral December 29th, 1170, being canonised two years later.

Becquerel, Antoine Henri (1852–1908), French physicist who in 1896 discovered radioactivity in uranium. Shared with the Curies the 1903 Nobel Prize in Physics.

Bede, "The Venerable" (673–735), a monk of great influence and ability whose historical works cover a great range and are valuable in the outline they give of the early history of this country.

Beecham, Sir Thomas, Bt., C.H. (1879–1961), conductor and impresario. Founded the London Philharmonic Orchestra in 1931; introduced into England the operas of Richard Strauss, Russian operas, and the Diaghilev ballet; championed the music of Delius. Recognised as one of the world's greatest conductors, especially in the interpretation of Mozart and Wagner. Conductor of the Royal Philharmonic Orchestra since 1946. Pub. Frederick Delius biography (1959); Memoirs: *A Mingled Chime.*

Beecher, Henry Ward (1813–1887), an eminent American preacher and lecturer, whose church at Brooklyn was for many years the most popular in the United States. Brother of Mrs H. B. Stowe.

Beerbohm, Sir Max (1872–1956), brilliant critic and caricaturist who contributed to the *Saturday Review* during his "twelve years' bondage to dramatic criticism" (1898–1910).

Beethoven, Ludwig van (1770–1827), one of the world's greatest musicians and composers, born at Bonn of a poor but musical family, his father being a tenor singer in the service of the electoral prince at Bonn. As a child he was already remarkable for his playing of the harpsichord and violin and for his power of extemporization. Some of his compositions, sonatas, songs and pianoforte variations were published when he was only 13. At 17 he visited Vienna and played before Mozart who promptly recognised his genius. When he was about 30 he began to suffer from the worst malady that could possibly have befallen him: he became deaf. He faced his fate with indomitable courage and perhaps more than any other artist continued to develop until he reached the loftiest pinnacle of musical fame. Between the years 1805 and 1808, Beethoven composed some of his greatest works: the oratorio *Mount of Olives*, the opera *Fidelio*, and the *Pastorale* and *Eroica* symphonies besides a number of concertos, sonatas and songs. He composed four overtures to *Fidelio* at different periods: *Leonore No. 2* (1805), *Leonore No. 3* (1806), *Leonore No. 1* (1807) and *Fidelio* (1814). The *Mass in C* was first performed in 1810 and the *Mass in D* was written between the years 1819 and 1822. The symphonies, nine in number, rank as the greatest ever written and the pianoforte sonatas and string quartets are unequalled in beauty. He died at Vienna at the age of 56.

Behring, Emil von (1854–1917), German bacteriologist and father of the science of immunology. Awarded Nobel Prize in 1901.

Behring, Vitus (1680–1741), Danish navigator who entered the Russian service and in 1728 discovered Behring's Strait, afterwards being wrecked on Behring's Island, where he died.

Belisarius (505–565), famous Roman general under Justinian. His defeats of the Goths and Vandals, and of the Persians were great achievements.

Bell, Alexander Graham, LL.D., Ph.D., D.Sc., M.D. (1847–1922), born in Edinburgh, went to America in 1870, became Professor of Physiology in Boston University. In 1876 exhibited an invention which was developed into the telephone. Invented the photophone, and devoted much attention to the education of deaf-mutes.

Bell, Gertrude Margaret Lowthian, C.B.E (1868–1926), the "uncrowned Queen of Arabia," was a famous traveller in the East, especially in Arabia.

Bellamy, Edward (1850–1898), American journalist and author of *Looking Backward*, a utopian novel in which he foretells of many changes that have since come to pass.

Bellini, a celebrated family of Venetian painters of the Early Renaissance. **Jacopo** (*c.* 1400–70) and his two sons **Gentile** (1429–1507), whose works include the *Adoration of the Magi* (National Gallery), and **Giovanni** (*c.* 1429–1516), the most important painter of the 15th cent., brother-in-law of Mantegna, and teacher of Giorgione and Titian.

Bellini, Vincenzo (1801–35), Italian operatic composer; born in Sicily, the son of an organist. His graceful vocal melodies were much admired by his friend Chopin and he enjoyed successes in Paris and London. His best-known operas are *I Capuleti ed i Montecchi*, *La Sonnambula*, *Norma*, and *I Puritani*.

Belloc, (Joseph) Hilaire (Pierre) (1870–1953), a writer of great versatility whose works include *The Bad Child's Book of Beasts*, *The Path to Rome*, *Hills and the Sea*, *Cautionary Tales*, and historical studies of Danton, Robespierre and Richelieu.

Belzoni, Giovanni Battista (1778–1823), a renowned explorer of Egypt who settled in England at the beginning of the 19th century. After a precarious existence began to turn his

attention to hydraulic experiments, and went to Egypt with a view to getting the Government to sanction a scheme of his for raising the water of the Nile. He was then attracted to the study of Egyptian antiquities, and engaged in highly successful researches.

Benedict, St. (c 480– c.543), b. at Nursia near Spoleto, in Umbria; founded twelve monasteries, and the Order of Benedictine Monks, at Monte Cassino, near Naples. Here he wrote his celebrated Rule, a unique document of wide application. (*See* **Monasticism, J30**).

Benes, Dr. Eduard (1884–1948), Czechoslovak statesman; co-founder with Thomas Masaryk of the Czech Republic; Foreign Minister, 1918–35, and President 1935–38 and 1940–48. An all-party ministry was overthrown by a communist *coup d'état* in February 1948, and Benes, in failing health, resigned the Presidency in June, dying in September.

Benavente y Martinez, Jacinto (1866–1954), one of the greatest of Spanish dramatists. Author of *Los Intereses Creados* and other famous plays. Nobel Prizewinner, 1922.

Ben-Gurion, David (b. 1886), Zionist leader. Educated at Istanbul University. Helped to organise the Jewish Legion in 1918, and was prominently connected with the Labour movement in Palestine in between the world wars. Prime Minister of Israel since 1948.

Bennett, Enoch Arnold (1867–1931), author and journalist. His stories of the Pottery Towns, where he was brought up, are of high merit. *The Old Wives' Tales*, *Clayhanger*, and *Hilda Lessways* are among his most successful novels. He also wrote plays, including *Milestones*, *The Great Adventure*, and *Mr. Prohack*.

Bennett, James Gordon (1841–1918), proprietor of the *New York Herald*, and a famous yachtsman and motorist. He sent out Stanley on the expedition which resulted in the finding of Livingstone.

Bennett, Sir William Sterndale (1816–1875), English composer best known for his oratorio *The Woman of Samaria*. Schumann pronounced him to be "a thorough Englishman, a glorious artist, and a beautiful and poetic soul"

Bentham, Jeremy (1748–1832), the founder of the school of political philosophy, the tenets of which were extended by John Stuart Mill. His works on *Government*, *Usury*, and *The Principles of Morals and Politics*, expound the Utilitarian system with great lucidity.

Bentley, Richard (1662–1742), an eminent classical scholar and critic, for long Master of Trinity College, Cambridge. He was a formidable controversialist and did pioneer work in textual criticism

Benz, Karl (1844–1929), German engineer whose motor car produced in 1885 was one of the first to be driven by an internal-combustion engine.

Béranger, Jean Pierre de (1780–1857), was the most popular song writer that France has produced. His songs were often written to serve some passing political purpose, and were invariably in harmony with popular sentiment.

Beresford, William Carr Beresford, Viscount (1768–1854), British General. Participated in capture of Cape Colony and of Buenos Aires. Reorganised Portuguese Army. Master-General of Ordnance in Wellington administration.

Berg, Alban (1885–1935), Austrian composer whose best known work is the three-act opera *Wozzeck*, based upon a drama by Büchner (*q.v.*), which has become a modern classic.

Bergson, Henri Louis (1859–1941), French philosopher, exponent of the theory of vitalism and the life force. Member of French Academy, 1941; Nobel Prize for Literature, 1927. Author of *Matter and Memory* (1896) and *Creative Evolution* (1907).

Bériot, Charles Auguste de (1802–70), Belgian violinist, whose first wife was the great operatic contralto Malibran. His son **Charles Wilfrid de Bériot** (1833–1914) was a fine pianist and the teacher of Ravel.

Berkeley, George, D.D., Bishop of Cloyne (1685–1753), the propounder of the philosophy that the only things that are real are our ideas of what is presented to our senses. In support of this philosophy he wrote several works of great ingenuity of argument, chief amongst them being his *Alciphron, or the Minute Philosopher*.

Berlin, Irving (b. 1888), American composer of popular songs, and the pioneer of both ragtime and jazz music; his songs including *Alexander's Rag-time Band*, *Always*, *What'll I Do?* were the beginning of popular jazz.

Berlioz, (Louis) Hector (1803–69), composer, born in S E. France, the son of a country doctor; eccentric, highly-endowed, he was the greatest figure in the French romantic movement. His outstanding dramatic works are *La Damnation de Faust* and the *Roméo et Juliette* symphony. His first wife was an Irish actress, Harriet Smithson, for whom he formed a romantic attachment while she was appearing in Shakespearean parts in Rome.

Bernadotte, Count Folke (1895–1948), nephew of the late King Gustav of Sweden. As head of the Swedish Red Cross arranged for the exchange of prisoners in the second world war. In April 1945, he was the intermediary through whom Himmler attempted to capitulate. Appointed United Nations mediator for Palestine in 1947 and brought about a truce between the Arabs and Jews, but was assassinated by Jewish terrorists.

Bernadotte, Jean Baptiste (1764–1844), was a French commander of great distinction who served under Napoleon, and in 1810 was chosen heir to the throne of Sweden In 1818 he succeeded as Charles XIV., and was a capable ruler.

Bernal, John Desmond, M.A., F.R.S. (b. 1901), Professor of Physics, Birkbeck College, since 1938. Author of *The Social Function of Science*, *Science in History*, *World Without War*, and of many other works on scientific and social subjects, notably crystallography, poison gases, and post-war housing.

Bernard of Menthon (923–1008), patron saint of mountaineers. Founded the alpine hospices of Saint Bernard on the famous Great Saint Bernard Pass between Switzerland and Italy

Bernard, Saint, of Clairvaux (c. 1090–1153), famous French abbot of the monastery of Clairvaux whose sermons and letters had very great influence in Western Europe.

Bernhardt, Sarah (1845–1923), the most renowned tragedienne of her time. Became a member of the Comédie Française after the Siege of Paris, and thereafter occupied a specially prominent position as an actress. Her first performance in London was in 1879. Among her most conspicuous successes are *Théodora*, *Fédora*, and *La Tosca*, while she also appeared as Hamlet with distinction.

Berthelot, Marcellin Pierre Eugène (1827–1907), French chemist and politician, and the first to produce organic compounds synthetically.

Berzelius, Jons Jakob (1779–1848), Swedish chemist, whose researches laid the foundations for modern chemical science He devised the system of chemical symbols in use today and discovered several elements.

Bessemer, Sir Henry, F.R.S (1813–1898), famous for his invention of the well-known process of converting cast-iron direct into steel. His invention entirely revolutionised steel manufacture, greatly reducing the cost of production and making it possible to utilise steel in many directions where previously iron only had been used.

Bevan, Rt. Hon. Aneurin, M P. (1897–1960). British socialist politician of remarkable genius; architect of the National Health Service which came into operation in 1948. M P. for Ebbw Vale, 1929–60. Min of Health, 1945–51; Min. of Labour, Jan–Apr 1951.

Beveridge, Lord, K.C B. (1879-1963), British economist. Director of the London School of Economics, 1919–37, and Master of University College, Oxford, 1937–44. Drew up the Beveridge Plan, published in 1942, which formed the basis of the present Health and Insurance Schemes.

Bevin, Rt. Hon. Ernest, M.P. (1881–1951), Secy. of State for Foreign Affairs 1945–51; Minister of Labour and National Service, 1940–45. A British Trade Union Leader who became prominently associated with the Dockers Union, of which he was Assistant General Secretary and of the Transport and General Workers Union of which he was still General Secretary when he entered the Coalition Government as Minister of Labour. He was Chairman of the General Council of Trades Union Congress, 1937

Bichat, Marie François Xavier (1771–1802), French physiologist and anatomist whose study of tissues founded modern histology. His theory was that life is " the sum of the forces that restrict death."

Biddle, John (1615–62), the first English Unitarian. He was fined, imprisoned and banished for his publications attacking the Holy Trinity. Under a general Act of Oblivion in 1652 he resumed his teachings, which led to further imprisonment, and as a result he died of fever.

Binyon, (Robert) Laurence, C.H. (1869–1943), English poet, art critic, and authority on Oriental art, keeper of prints and drawings at the British Museum. He wrote many books on art including *Drawings and Engravings of William Blake*.

Birch, (Samuel John) Lamorna, R A. (1869–1955), English landscape painter in oils and water-colours, well known for his charming Cornish landscapes and sea studies. His pictures are hung in all the principal galleries of England.

Bird, Cyril Kenneth, C.B.E., B.Sc. (*nom de plume* Fougasse) (b. 1887), humorous artist who edited *Punch* from 1948 to 1952. His witty drawings, many under the title *The Changing Face of Britain*, enlivened the pages of *Punch* for many years and the " Careless Talk Costs Lives " series of the second world war were his creation.

Birkbeck, George (1776–1841), physician, philanthropist, and philosopher. A Yorkshireman who settled in London in 1804, and became the chief founder of Mechanics' Institutes

Birkenhead, 1st Earl of, P.C, G.C.S I (1872–1930), Sec. for India, 1924–1928. Lord Chancellor, 1919–1922, Attorney-General 1915 to 1919. M.P. for the Walton Divn of Liverpool from 1906 to 1918, and West Derby Divn. thereof from Dec 1918 to Jan. 1, 1919.

Birkett, 1st Baron (William) Norman, Q C. (1883–1962), great English advocate; Lord Justice of Appeal, 1950–7; Judge King's Bench Div 1941–50; British Mem. (Deputy) Int. Mil Tribunal at Nuremberg 1945–46; M P (L.) for East Nottingham, 1923–24 and 1929–31

Bishop, Sir Henry Rowley (1786–1855), composer of many popular ballad operas and songs. *Maid Marian*, *Guy Mannering* and *The Miller and his Men*, are his best-known operas. He was also a very successful glee-writer, and was the composer of *Home, Sweet Home* Was the first musician to be knighted in 1842.

Bishop, Air Marshal William Avery, V C, C B, D.S O, M.C., D F.C (b 1894), Canada's greatest airman. Officially credited with the destruction of 72 enemy aircraft in the first world war

Bismarck, Otto Eduard Leopold von, Prince Bismarck, Duke of Lauenburg (1815–98), Prusso-German statesman, chief architect of the German empire. Of Junker family he began his diplomatic career in 1851 when he was appointed Prussian member of the revived German Diet of Frankfurt Prussian ambassador at St. Petersburg (1859–62), where he gained the confidence of the new Tsar (Alexander II), and at Paris (1862), where he had the opportunity of studying Napoleon III. Recalled to Germany by William I to head his government, from which time dates the autocratic rule which was ultimately to prove so disastrous for Germany and the world There followed the events which led to the victory over Austria in 1866, the humiliation of France in 1871 culminating in William I being proclaimed emperor of Germany at Versailles. From 1871 until the death of William I in 1888 the rule of the " iron chancellor " dominated Europe and German domestic affairs A struggle for supremacy developed between Bismarck and William II which ended (1890) in the " old pilot " being dropped, to use a figure of speech made memorable by one of Tenniel's cartoons. Bismarck retired to his country estates to spend the rest of his life in criticism of the emperor.

Bizet, Georges (1838–75), properly Alexandre César Léopold, French composer who gave the operatic stage several operas full of charming melody and whose immortal *Carmen* from the story by Mérimée was his greatest achievement. He also wrote some orchestral works, piano music, and songs. He died too young to enjoy popularity.

Björnson, Bjornstjerne (1832–1910), the Norwegian poet, dramatist, and novelist is one of the great names in modern European literature, his poems, plays, and stories being marked by a strong intellectuality and a rich imagination.

Black, Joseph (1728–99), Scottish chemist. Prof. of anatomy at Glasgow (1756–60) and of medicine and chemistry at Edinburgh (1760). Specially known for discoveries of carbon dioxide (he called it " fixed air ") and latent heat. His original work earned him the title father of quantitative chemistry.

Blackett, Patrick Maynard Stuart, F.R.S, M A. (b. 1897), Professor of Physics, Imperial College of Science and Technology, 1953; Manchester University, 1937–52. Author of *The Military and Political Consequences of Atomic Structure* (1948), *Atomic Weapons and East-West Relations* (1956). Awarded Physics Nobel Prize 1948 for his work in developing the Wilson cloud chamber method of tracing tracks of swift atomic particles. President of the British Association, 1957.

Blackmore, Richard Doddridge (1825–1900), a novelist who in 1869 made a great reputation with his romantic story of *Lorna Doone*.

Blackstone, Sir William (1723–1780), was a Justice of the Court of Common Pleas. His great work, *Commentaries on the Laws of England*, became one of the British classics.

Blackwood, Algernon, C.B.E. (1869–1951), British author. As a young man, farmed in Canada and worked on New York newspapers. Then, from 1906, produced a steady flow of books, plays, and short stories of high quality.

Blair, Robert (1699–1746), a noted Scottish poet, whose poem, *The Grave*, entitles him to a place in all collections of British poetry.

Blake, Robert (1599–1657), Parliamentary general and an admiral in the Cromwellian navy in the Dutch and Spanish wars.

Blake, William (1757–1827), painter, poet, and mystic, whose *Songs of Innocence* and scriptural drawings reveal an intense spirituality. He was a highly independent and original thinker and has been called " the great teacher of the modern western world "

Bland-Sutton, Sir John, Bt., M D. (1855–1936), an eminent surgeon, whose association with the Middlesex Hospital is commemorated by the Bland-Sutton Institute of Pathology.

Blasco-Ibáñez, Vicente (1867–1928), a Spanish man of letters who wrote *The Four Horsemen of the Apocalypse* and other novels which made him world-famous.

Blériot, Louis (1872–1936), French airman; the first to fly the English Channel from Calais to Dover, July 25, 1909.

Blind, Karl (1826–1907), was a native of Mannheim, and in 1847 associated himself with the German revolutionary movement, but was arrested and imprisoned Gaining his liberty, he resided in Brussels for a time, and afterwards settled in London, remaining in close touch with men like Mazzini and Louis Blanc, and by pen and speech constantly advocating political freedom.

Bliss, Sir Arthur (b. 1891), English composer, succeeded Sir Arnold Bax as Master of the Queen's Musick in 1953. His best known works are the *Colour Symphony* (1922), *Morning Heroes* (1930) and his ballet *Checkmate* (1937). Mus. Dir B.B.C., 1941–44

Bloch, Ernest (1880–1959), composer, whose music is characterised by its Jewish and oriental themes. He was born in Geneva, Switzerland, and became a naturalised American citizen.

Blomfield, Sir Reginald, R A., M A., F S A (1856–1942); was a prominent architect, designer of gardens and country houses.

Blondin, Charles (Jean François Gravelet) (1824–1897), a famous French rope performer, who crossed Niagara Falls on a tight-rope

Blücher, Field-Marshal Gebhard Leberecht von (1742–1819), was the famous Prussian commander who, after a long and brilliant military career, joined forces with Wellington in the final campaign against Napoleon, and materially helped to win the great victory of Waterloo by advancing to Wellington's support.

Blum, Léon (1872–1950), statesman and architect of French socialism. Led a " popular front " government in 1936 and a " caretaker " govern-

ment for a brief period 1946–47. Served as vice-premier 1937–38. During 1940–45 was interned in Germany.

Blunden, Edmund Charles (b. 1896), English poet who was Prof. of Literature at Tokyo University 1924–27. Gained the Hawthornden Prize in 1922 for his poem, *Shepherd*. Fellow and Tutor in English Literature, Merton College, Oxford, 1931–43. Prof. of Literature Hong Kong University, 1954– .

Blunt, Wilfrid Scawen (1840–1922), best known for the part he took in Egyptian affairs in 1881–1882 and his continued support of what is called the Egyptian national movement. He was a devoted admirer of Arabi Pasha, and spent much money in his defence. In 1907 he published his *Secret History of the English Occupation of Egypt*, which aroused much controversy. He married a granddaughter of Lord Byron.

Boadicea, queen of the Iceni tribe of Britons, who raised an army against and defeated the Roman invaders, but was afterwards vanquished by Suetonius and committed suicide in 62.

Boccaccio, Giovanni (1313–1375), an Italian author who has often been called the father of the novel. He had a lively imagination and a graceful style, and his famous *Decameron*—condemned by two Popes and by the Council of Trent—has been a fount of inspiration to poets and story-tellers from Shakespeare to Keats.

Boccherini, Luigi (1743–1805), Italian composer, contemporary of Haydn, who first gained fame as a 'cellist. Settled in Madrid in 1769 as composer to the Chapel of the Infante, which position he held until 1785. Was appointed composer to the Court of Frederick William II. of Prussia, but returned to Spain in 1797, and died in poverty in Madrid.

Bode, Johann Elert (1747–1826), German astronomer remembered mainly for his law (known as Bode's Law) for the calculation of the relative distances of the planets from the sun.

Boehm, Sir Joseph Edgar, Bt., R.A. (1834–90), British sculptor. Executed several famous monuments and statues including that of Carlyle on the Chelsea Embankment, the monument to Dean Stanley in Westminster Abbey, Darwin in the Natural History Museum, Kensington, and the equestrian statue of the Duke of Wellington at Hyde Park Corner.

Bohr, Niels Henrik David (1885–1962), Danish nuclear physicist whose researches into the structure of the atom gave him great authority in the world of theoretical physics. With Rutherford he applied the quantum theory to the study of atomic processes. Awarded Nobel Prize for Physics, 1922.

Boieldieu, François Adrien (1775–1834), French composer whose masterpiece, *La Dame Blanche*, was published in 1825. Composed many works in collaboration with Cherubini and Mehul. Succeeded Mehul as Professor of Composition at the Conservatoire, Paris, in 1817.

Boileau-Despréaux, Nicolas (1636–1711), literary critic and French poet who was contemporary with Molière, Racine, and La Fontaine. He wrote many classical imitations and is famous for his *Satires*.

Boito, Arrigo (1842–1918), Italian poet and composer. He wrote the libretti of *Otello* and *Falstaff* for Verdi, and for his own operas of *Mefistofele* and many others.

Boleyn, Anne (1507–36), queen of Henry VIII and mother of Queen Elizabeth. Originally maid-in-waiting to Catharine of Aragon and her successor when Catharine's marriage was annulled. She failed to produce a male heir and was beheaded on a charge of adultery.

Bolivar, Simón (1783–1830), the first President of Venezuela and subsequently Dictator of Peru, commonly called the Washington of South America.

Bonaventura, St. (1221–1274), a Franciscan monk of great learning and piety, and a leading Schoolman. He was called "the Seraphic Doctor."

Bondfield, Rt. Hon. Margaret Grace, C.H. (1873–1953), Min. of Labour, 1929–31. Represented Northampton, 1923–24. Wallsend, 1926–31. First woman member of a British Cabinet.

Bone, Sir Muirhead (1876–1953), Scottish artist, famous for his drawings and etchings of architectural subjects. Excelled in dry-point and drawings of intricate scaffolding. His son **Stephen Bone**, painter and critic, died in 1958 at the age of 53.

Bonheur, Rosa (1822–1899), a native of Bordeaux, and one of the most noted animal painters of the 19th century.

Boniface, St. (*c.* 675–754), a Benedictine monk, native of Devon, original name Wynfrith. Sent by Pope Gregory II on missionary work in Germany, appointed archbishop of Mainz, 746. Attacked and killed with over 50 companions by pagans in Friesland.

Booth, Edwin (1833–93), American Shakespearean actor, son of Junius Brutus Booth, the English tragedian, and brother of John Wilkes Booth, who assassinated President Lincoln.

Booth, William (1829–1912), founder and first general of the Salvation Army, b. Nottingham. He entered the Methodist New Connexion and was from the first interested in evangelical work. In 1865, with the help of his wife, Catherine Booth, he began mission work in the East End of London which led to the creation in 1878 of the Salvation Army on military lines. His zeal and organising ability developed it into a great religious military organisation with branches in many parts of the world. His son Bramwell (*d.* 1925) and his daughter Evangeline were among his successors.

Borgia, Cæsar (1476–1507), the masterful and unscrupulous son of Pope Alexander VI., who paved his way to power by the murder of those who stood in his way, and aided by Louis XII. of France, became ruler of Romagna, the Marches, and Umbria. Pope Julius II banished him from Rome, and he was imprisoned in Spain, but escaped to find a soldier's death in the Army of Navarre in the invasion of Castile.

Borodin, Alexander Porfyrievich (1834–87), Russian composer who was a professor of chemistry and founded a school of medicine for women. In a busy professional life he wrote two symphonies, three string quartets, the symphonic sketch *In the Steppes of Central Asia*, some beautiful songs, piano music, and the immortal opera *Prince Igor*, left unfinished at his death but completed by his friends Rimsky-Korsakov and Glazunov.

Borotra, Jean (b. 1898), famous French lawn tennis champion, known as "the bounding Basque." A popular figure at the Wimbledon championships before and after the second world war.

Borrow, George Henry (1803–81), English author, for many years agent for the British and Foreign Bible Society; in the course of his wanderings studied gypsy life and wrote of his experiences in *Lavengro*, *Romany Rye*, *Bible in Spain*.

Bose, Subhas Chandra (1897–1945), Indian nationalist leader, killed in aeroplane crash.

Boswell, James (1740–1795), made himself famous by writing *The Life of Dr. Johnson*, spending some years in close intimacy with the great lexicographer, and producing what is probably the finest biography in the language. His own journals and letters, collected together by Yale University and published in 1949 as *The Boswell Papers*, are among the greatest literary collections ever assembled.

Botha, General the Rt. Hon. Louis (1862–1919), the Boer general who succeeded Joubert in command of the Transvaal forces in the Boer War 1899–1902. On parliamentary government being granted to the Transvaal in 1907 he became the first Prime Minister, and attended the Imperial Conference in England the same year. In 1910 made first Premier of the South African Union. After the outbreak of war with Germany took the field at the head of a Union force and, in addition to putting down a rebel movement engineered by Germany, conquered a large portion of German African Territory.

Bottesini, Giovanni (1821–89), Italian double-bass player, also famous as an opera conductor and composer.

Botticelli, Sandro (*c.* 1444–1510), Italian painter and disciple of Savonarola, the democrat. Produced many notable pictures, and assisted in the decoration of the Sistine Chapel. His illustrations to Dante's *Divine Comedy* are world-famous.

Bottomley, Horatio (1860–1933), politician, journalist, financier, and for many years one of the most notorious characters in England.

A brilliant speaker, he was twice M.P. for South Hackney. Altogether 260 petitions in bankruptcy were presented against him, mostly without effect; he was constantly in the law courts, defending himself with skilful audacity against famous K.C.s. Millions of pounds passed through his hands, much of it obtained from small investors, but he died in poverty after serving seven years' penal servitude for fraud.

Boughton, Rutland (1878–1960), English composer who has also written on the history and philosophy of music. His opera *The Immortal Hour* has enjoyed great success.

Boult, Sir Adrian C., Kt., M.A., D.Mus., F.R.C.M. (b. 1889). Chief conductor London Philharmonic Orchestra, 1950–57, which he took to Russia in 1956. Conductor of the B.B.C. Symphony Orchestra, 1930–50, and Musical Director B.B.C., 1930–42

Bowdler, Thomas (1754–1825), a pious English physician, who issued expurgated editions of Shakespeare and Gibbon, eliminating all expressions offensive to good taste. Hence the term "bowdlerise."

Boyce, William (1710–79), famous London organist, composer of church music, songs and cantatas, and master of the orchestra of George III.

Boyd Orr, John, 1st Baron, F.R.S., M.D., D Sc. (b. 1880), scientist, farmer and nutritional expert. Prof. of Agriculture, Aberdeen University, 1942–45, Director-General, World Food and Agricultural Organisation, 1945–48, now Chancellor of Glasgow University. Awarded Nobel Peace Prize, 1949

Boyle, Hon. Robert, F R S (1627–1691), English scientist who with Robert Hooke laid the foundations of the modern sciences of chemistry and physics. He established "Boyle's law," which states that the volume of a gas varies *inversely* as the pressure upon it, provided temperature be constant.

Bradley, General of the Army Omar N. (b. 1893), distinguished American soldier who was appointed chairman of the Joint Chiefs of Staff in succession to Gen. Eisenhower in 1949 Commanded 2nd U.S. Army Corps in Tunis and Sicily, the American Assault Forces in Normandy in 1944, and later the 12th U S. Army Group. Retired 1953.

Bradman, Sir Donald George (b. 1908), Australian cricketer and one of the world's best batsmen. Captained Australia in Test matches against England, 1936–48.

Bragg, Sir Wm. (Henry), O.M., K.B.E., F.R.S., M.A., D.Sc. (1862–1942), was a brilliant scientist. Nobel Physics Prize, 1915. Was Director of the Royal Institution of Great Britain; Fullerian Prof. of Chemistry, Royal Institution, and Director of Davy-Faraday Research Laboratory, 1923–42; President of British Association, 1928. President of the Royal Society, 1936–40.

Bragg, Sir (William) Lawrence, O B E, M C, F.R.S. (b. 1890), succeeded Lord Rutherford as Cavendish Prof. of Experimental Physics, Cambridge Univ., 1938–53. Dir. Royal Institution. 1954– . Shared with his father (Sir Wm. H Bragg) the 1915 Nobel Prize for research work on X-rays and crystal structures.

Brahe, Tycho (1546–1601), a celebrated Danish astronomer, and fellow-worker of Kepler. With large sums of money put at his disposal by Frederick II. of Denmark, he built an observatory called Uraniborg on the island of Hveen, near Copenhagen, where for over 20 years he carried out a vast programme of accurate and systematic observations of the heavenly bodies and compiled tables of their motions.

Brahms, Johannes (1833–97), composer, regarded as outstanding figure of German classic-romantic school; born in Hamburg, the son of a double-bass player. His compositions are classical in form yet possess deep intensity of expression and poetic significance. He composed four symphonies which rank amongst the greatest ever written, two piano concertos, a violin concerto, a double concerto for violin and 'cello, much fine chamber music, numerous songs of great lyrical beauty, and choral work, notable among which is his *German Requiem*. Lifelong friend of the Schumanns. His life was devoted to music; he never married.

Braille, Louis (1809–52), French educationist, who, as teacher of the blind, perfected his system of reading and writing for the blind. As the result of an accident when he was three years old he was himself blind.

Bramah, Joseph (1749–1814), a Yorkshireman who devoted himself to invention, introduced numerous mechanical improvements, including the hydrostatic press, a liquid-pumping apparatus, a most ingenious series of safety locks, and bank-note printing machines.

Brampton, Lord, P.C. (1817–1907), long known to the public as Sir Henry Hawkins. Was famous as an advocate, and took part in many celebrated cases, including the Tichborne trial. His *Reminiscences*, published in 1904, was one of the books of the year.

Brandes, Georg Morris Cohen (1842–1927), Danish literary critic who exerted a vitalising influence on literature and art. He was the author of many fine critical works, notable among which were his published lectures *Main Currents in European Literature of the 19th Century* and his studies *Benjamin Disraeli, William Shakespeare, Goethe, Voltaire, Julius Cæsar, Michelangelo*.

Brangwyn, Sir Frank, R.A , R P.E. (1867–1956), artist of Welsh extraction born at Bruges; first worked for William Morris making cartoons for textiles. His first painting, "A Bit of the Esk," was exhibited at the Royal Academy in 1885. He was regarded as the greatest mural artist and etcher of his day

Breakspear, Nicholas. *See* **Adrian IV.**

Brecht, Bertold (1898–1959), German dramatist and poet, whose cynical and satirical works are characteristic of the period between the two world wars. He left Germany in 1933 for Russia, went to the United States in 1941, and returned to E Germany after the war. His plays include *Die Dreigroschenoper* (with music by Kurt Weill).

Brennan, Louis, C.B. (1853–1932), successful inventor, born in Ireland. Paid £120,000 by the British Government for his gyro-directed torpedo; also the inventor of a mono-rail locomotive on the gyroscope principle

Brewster, Sir David, LL.D., F R.S (1781–1868), Scottish physicist and natural philosopher, a great experimenter and prolific writer. Noted for his researches into the polarisation of light Reputed to be one of the founders of the British Association.

Bridges, Edward, 1st Baron, G.C.B., G C.V.O , P.C., M C. (b. 1892), son of Robert Bridges Permanent Secretary to the Treasury and Head of Civil Service, 1945–56. Secretary to the Cabinet, 1938–46. Chanc Reading Univ., 1959 Chairman of British Council, 1959–.

Bridges, Robert, O M., M A. (1844–1930), was Poet Laureate 1913–30. Practised medicine up to 1882, thenceforward devoting himself mainly to literature. He published several volumes of poems and plays, displaying refined fancy and a broad philosophic spirit. His *Testament of Beauty* was published in 1930.

Bridgewater, Francis Egerton, 3rd (and last) Duke of (1736–1803). The projector of the famous Bridgewater Canal, which was the beginning of the great English canal system, and yielded his family enormous wealth; it was absorbed in 1887 by the Manchester Ship Canal Company, who paid £1,710,000 for it.

Bridgewater, Francis Henry Egerton, 8th (and last) Earl of, F.R S. (1756–1829), grand-nephew of the last-named, and founder of the famous *Bridgewater Treatises*, written by the most celebrated divines and scientists of the day, and devoted to demonstrating the power, wisdom, and goodness of God, as manifested in the Creation.

Bridie, James, (pseudonym of Osborne Henry Mavor), C.B.E., LL.D., M.D. (1888–1951), Scottish author and dramatist. Educated at Glasgow Academy and University. The first of his many successful plays was *The Anatomist*, produced in 1931. Others include *Tobias and the Angel, Jonah and the Whale, Mr. Bolfrey, Dr. Angelus*.

Brieux, Eugène (1858–1932), French dramatist, whose plays are satires on definite evils of society, and deal with such subjects as divorce, legal hypocrisy, social diseases, etc. Was elected a member of the French Academy in 1909.

Bright, Sir Charles Tilstone (1832–88), English telegraph engineer, who after superintending

the laying of telegraph lines in many parts of Great Britain organised the Atlantic Telegraph Company (1856), and as Engineer-in-chief supervised the laying of the first Atlantic Cable (1858).

Bright, Rt. Hon. John (1811—1889), a famous Radical Quaker statesman and orator, one of the chief promoters of the Reform movement which led to the introduction of Free Trade.

Britten, Edward Benjamin, C.H. (b. 1913), English composer of a variety of music, including song cycles, chamber music, choral works, and the operas *The Rape of Lucrezia*, *Peter Grimes*, *Albert Herring* and *Billy Budd*.

Broca, Paul (1824–80), French anthropologist, surgeon and pathologist. From 1867 he was Professor of Pathology, Paris. He discovered the seat of speech in what is known as convolution of Broca. He was the founder of modern anthropology and is regarded as the originator of the science of craniology.

Brock, Sir Thomas, K.C.B., R.A. (1847–1922), pupil of Foley, achieved a high reputation as a sculptor. The Queen Victoria Memorial in front of Buckingham Palace is his work.

Brogan, Denis William, M.A. (b. 1900), Prof. of Political Science at Cambridge. An authority on France, America, and Britain, and his works include *The Development of Modern France*, *Politics and Law in the United States*, and *The English People*.

Broglie, French noble family of Piedmontese origin who settled in France in the 17th cent. **Victor Maurice, comte de Broglie** (1671–1745) was marshal of France and fought in the wars of Louis XIV. **Louis Victor, prince de Broglie** (b. 1892) and **Maurice, duc de Broglie** (1875–1960) the eminent French physicists are grandsons.

Brontë, Charlotte (1816–1855), one of the most gifted novelists of the 19th century. Her *Jane Eyre*, published in 1847, attracted universal notice, and her other novels, *Shirley*, *Villette*, and *The Professor*, are all marked by the force of strong genius. Her sisters, **Emily** (1818–48) and **Anne** (1820–49), also wrote novels and poems, Emily's *Wuthering Heights* and some of her verse showing exceptional power.

Brookeborough, Basil Stanlake Brooke, 1st Viscount, C.B.E., M.C. (b. 1888), Prime Minister of Northern Ireland 1943–63. An Ulster Unionist.

Brooke, Rupert (1887–1915), a British poet who died during the first world war, whose works, though few, showed great promise and include the poems *Grantchester* and *If I Should Die*.

Brougham, Lord, P.C., F.R.S. (1778–1868), one of the chief legal luminaries of the 19th century, who made a great name by defending Queen Caroline against George IV., and afterwards rose to political eminence.

Brown, Sir Arthur Whitten, K.B.E. (1886–1948), together with Sir John Alcock (d. 1919) in 1919 made the first transatlantic flight, crossing from Newfoundland to Ireland in 16 hr. 12 min.

Brown, John, "of Ossawatomie" (1800–1859), the hero of Harper's Ferry, whose action in inciting certain negro slaves to rebel in 1859 struck the note of alarm which resulted in the Civil War. His attempt to take the Arsenal at Harper's Ferry was defeated, and he was hanged, being afterwards regarded as a martyr by the Abolitionists.

Browne, Charles Farrer (Artemus Ward) (1834–1867), was one of the most whimsical and entertaining humorists America has produced. In addition to his books he wrote and delivered exceedingly funny lectures, and was making an English tour with them when he was seized with a fatal illness, dying at Southampton.

Browne, Hablot Knight (1815–1882), best known as "Phiz," the illustrator of Dickens's novels, from the *Pickwick* period down to *Little Dorrit*.

Browne, Sir Thomas (1605–82), author of *Religio Medici*, was a London physician and antiquary.

Browning, Elizabeth Barrett (1806–1861), an English poetess of eminence who, between 1830 and 1860, wrote many poems showing great intellectual grasp and imaginative fervour. Some of her works, such as *The Cry of the Children*, *Lady Geraldine's Courtship*, *The Romaunt of the Page*, and *Bertha in the Lane*, are sure of immortality, and her *Aurora Leigh*, a novel in poetic form, is, in portions, on a high level of poetic execution. She was married to Robert Browning in 1846, and afterwards lived mostly in Italy.

Browning, Robert (1812–1889), one of the two greatest poets of the later Victorian era. His earlier poems and dramas, though marked by singular insight and power, were far from popular, mainly because of a somewhat obscure and involved style from which he only occasionally freed himself. His *Strafford* and *The Blot on the 'Scutcheon* were both produced by Macready, and attained some measure of stage success; but Browning was essentially a poet to be read, rather than acted. Some of his dramatic characterisations are of striking power. From about 1864 he published many works and knew at last what it was to be an appreciated poet. His *Men and Women*, *Dramatis Personæ*, and *The Ring and The Book*, contain some of the finest poetry of modern times.

Bruce, Robert (1274–1329), took part with Sir William Wallace, (q.v.) in the revolt against Edward I., later leading the popular cause. Achieved one victory after another, until at Bannockburn he overthrew the English army and ultimately secured Scottish independence. He reigned twenty-two years as King Robert I.

Bruch, Max (1838–1920), German composer and conductor, best known for his G minor violin concerto.

Bruckner, Anton (1824–96), Austrian composer and organist. He wrote nine symphonies, much religious music, including a *Te Deum* for chorus and orchestra, and one string quartet.

Brummell, George Bryan (1778–1840), "Beau Brummell," the fashion leader in English Society when George IV was Prince of Wales; was a *bon vivant* and gamester whose excesses involved him in imprisonment and ultimate imbecility.

Brunel, Isambard Kingdom (1806–1859), a prominent engineer who constructed the more difficult portions of the Great Western Railways, and many other important works. He also achieved eminence as a designer of steamships.

Brunel, Sir Mark Isambard (1769—1849), father of the last-named, and constructor of the Thames tunnel, finished in 1843.

Brunelleschi, Filippo (1377–1446), Italian architect, born in Florence, pioneer of Renaissance architecture, adapting the ideals of the Roman or classic period to the conditions of his own day. Many examples of his work are to be seen in Florence—in the Pitti Palace, the Churches of San Lorenzo and San Spirito, the great cupola of the cathedral of Santa Maria del Fiore and the beautiful carved crucifix in the Church of Santa Maria Novella.

Bruno, Giordano (c. 1548–1600), Italian philosopher and martyr, entered the Dominican Order at Naples in his 15th year. Accused of heresy he fled from his convent and roamed over Europe. In 1592 he returned to Italy and was arrested by the Inquisition. After 7 years in prison was burned at the stake, Feb. 17, 1600. A statue to him was erected in the Campo dei Fiori, 1889.

Brutus, Marcus Junius (85–42 B.C.), Roman Governor and one of the founders of Roman civil law.

Bryant, Arthur Wynne Morgan (b. 1899), English historian and pageant producer. Among his works are *English Saga, 1840–1940*, a life of *George V.*, *The Story of England*, and several books on the Napoleonic war years and the Restoration period, including a balanced and informative biography of Pepys.

Buchanan, George (1506–82), Scottish humanist who spent most of his life in France lecturing and writing Latin poems, plays, and treatises. Montaigne, Mary Queen of Scots, and James VI of Scotland were his pupils at various times. He was the best Latin scholar of his age, and his most important works are *De jure regni apud Scotos* and *Rerum Scoticarum historia*.

Buchman, Rev. Frank Nathan David (1878–1961). American evangelist, founder of the movement known as Moral Re-armament. Initiated in 1920 the religious fellowship known as the Oxford Group Movement.

Buchner, Eduard (1860–1917), German chemist and professor, famous for his discovery of the enzymes within yeast cells and for his work in the chemistry of fermentation. For this he was awarded the 1907 Nobel Prize for Chemistry.

Büchner, Georg (1813–37), German dramatist

whose career was terminated by his early death at the age of twenty-four, but whose limited output (principally *Dantons Tod* and the fragment *Wozzeck*) is marked by extraordinary power and maturity.

Buckle, Henry Thomas (1821–1862), the author of *The History of Civilisation in England*, one of the most vigorous productions of the 19th century.

Budge, Sir Ernest Alfred Wallis, Litt. D., D Litt., F.S.A. (1857–1934), a distinguished archæologist who conducted many excavations in Mesopotamia and Egypt. Was Keeper of Egyptian and Assyrian Antiquities at the British Museum, 1893–1924.

Buffon, Georges-Louis Leclerc, Comte de (1707–88), French author and naturalist who devoted his life to the study of natural history and whose great work *Histoire Naturelle* in 36 volumes appeared between 1749 and 1789

Bulganin, Marshal Nikolai Alexandrovitch (b. 1895), Prime Minister of Soviet Russia, 1955–58 Formerly Soviet Defence Minister. Retired 1960.

Bull, John (c. 1562–1628), was organist to James I. and composed much acceptable music, including, it is supposed, our National Anthem *God save the Queen.*

Bülow, Hans Guido von (1830–94), German pianist and conductor, an outstanding figure among the musicians of his day. He married Liszt's daughter Cosima, who later left him to marry Wagner.

Bunsen, Robert Wilhelm (1811–1899), German chemist, discoverer of the metals cæsium and rubidium, and inventor of the Bunsen burner, battery, and pump. Made many important observations in spectrum analysis.

Bunyan, John (1628–1688), was originally a travelling tinker and is believed to have served in the Parliamentary army He joined an Independent church in Bedford in 1655 and became a popular preacher. After the Restoration he was thrown into prison, and there wrote *Pilgrim's Progress*, the finest allegorical work in this or any language Of his other works the *Holy War*, *Grace Abounding*, and *Mr. Badman* are the best known

Burckhardt, Jacob Christoph (1818–97), Swiss historian whose *The Civilisation of the Renaissance in Italy* is one of the great classics on the subject.

Burghley, William Cecil, Lord (1520–1598), Secretary to Lord Protector Somerset, an influential statesman under Edward VI. and Queen Mary, and subsequently Queen Elizabeth's favourite Minister for forty years

Burke, Edmund (1729–1797), the acknowledged philosopher of conservatism son of a Dublin attorney, went to London in 1750, and made his mark in literature by his famous work on the *Sublime and Beautiful*. Later on was private secretary to the Marquis of Rockingham, then Premier, and entered Parliament, where he quickly made a name. An able and earnest debater, he took part in all the great movements of his time, and in 1795, after his retirement, was awarded a handsome pension from the Civil List

Burnet, Bishop Gilbert (1643–1715), wrote a *History of His Own Times*, which deals with many events of which he had personal knowledge, and is a valuable legacy to historical scholars.

Burnet, Sir John James, R.A (1859–1938), was a leading British architect, whose most important work was the King Edward VII Galleries of the British Museum, opened in May 1914 Among his many large buildings in London are Adelaide House, and the extension to Selfridge's.

Burney, Fanny (*See* **D' Arblay, Madame.**)

Burns, Robert (1759–1796), Scotland's greatest poet. Startled the world with a little book of poems in 1786 which proclaimed him a true son of the muses. With the £500 that his book yielded him he bought a farm, obtained an appointment with the Excise in 1789, and for the last five years of his life lived at Dumfries In his career he poured forth song after song of emotional tenderness, and made his name immortal.

Burton, Sir Richard Francis, K C.M.G. (1821–1890), explorer, orientalist, and diplomatist, who became famous after making a pilgrimage to Mecca in 1853 disguised as a Mohammedan. Later he did much exploring in Central Africa, wrote several books and made a remarkable literal translation of the *Arabian Nights* (16 vols.).

Busoni, Ferruccio Benvenuto (1866–1920), the greatest pianist of his age, and composer of 3 operas (the last, *Dr. Faust*, unfinished at his death), much orchestral and chamber music, and works for the piano. He was born in Empoli near Florence but spent much of his life in Germany.

Bustamante, Sir William Alexander (b 1884). Prime Min. of Jamaica which gained independence in 1962; leader of the Jamaican Labour Party.

Butler, Joseph (1692–1752), an English divine who occupied an important place among eighteenth-century thinkers. He declined the Archbishopric of Canterbury in 1747, but in 1750 became Bishop of Durham. In 1736 he published his *Analogy of Religion*, the whole of which was a reply to the deistic attacks on revealed religion.

Butler, Dr. Nicholas Murray (1862–1947), President of Columbia University, 1902–45. A well-known publicist and internationalist and one of the most honoured and distinguished leaders in the world of education. Shared with Jane Addams (*q v.*), the noted American sociologist the Nobel Prize for Peace, 1931

Butler, Rt. Hon. Richard Austen, C H , M P (b 1902), First Min of State, 1962–; Dep Prime Min , 1961– , Home Sec , 1957–62, Chair Cons Party, 1959–61, Leader of the House of Commons, 1955–61, Chan of the Exchequer, 1951–55, Min of Education 1941–45, and responsible for the Education Act, 1944 A member of the distinguished Cambridge family and son of the late Sir Montague Butler, formerly Master of Pembroke. Took leading part in the drawing-up of the various political charters setting out Conservative policy Chanc Sheffield Univ.

Butler, Samuel (1612–1680), renowned as the author of *Hudibras*, one of the wittiest poems in the language and one of the most quoted. His last years were spent in poverty, and he was buried in the churchyard of St. Paul's, Covent Garden, and given a memorial in Westminster Abbey, " that he who was destitute of all things when alive might not want a monument when dead "

Butler, Samuel (1835–1902), author of the satirical novel *Erewhon* and its sequel *Erewhon Revisited* Other works include *The Fair Haven* (1873), *Life and Habit* (1877) *Evolution Old and New* (1879), in which he attacked Darwinism *The Way of All Flesh* and his famous *Notebooks* were published posthumously Butler was a man of great originality and scholarship He studied painting and exhibited regularly in the Academy and was also a musician

Butt, Dame Clara, D.B E (1873–1936), the famous English contralto, made her first professional appearance in London in 1892. Her success was immediate. She was married to Mr Kennerly Rumford—also an able vocalist—in 1900

Buxton, Sir Thomas Fowell, 1st Bart. (1786–1845), a philanthropist and zealous advocate of the abolition of slavery

Byrd, Rear-Admiral Richard Evelyn (1888–1957), famous American aviator and Polar explorer Was in command of the Macmillan Arctic Expedition, 1925, flew over the North Pole, 1926, with three companions flew across the Atlantic, 1927, and in 1929 made the first flight over the South Pole Discovered Edsel Ford mountains and Marie Byrd Land on his first expedition to the Antarctic, 1928–30. He made a second expedition in 1933–5, a third in 1939, and a fourth in December 1946.

Byrd, William (1543–1623), English writer of keyboard music and the greatest musician of the 16th century. He wrote church music, sacred choral music, string music, vocal and instrumental music, and founded the school of English madrigalists. He was organist of Lincoln Cathedral at 20 and later of Queen Elizabeth's Chapel Royal.

Byron, George Gordon, 6th Lord (1788–1824), was the poet who exercised the greatest influence upon European thought during the early part of the 19th century. Educated at Harrow and Cambridge, he published his *Hours of Idleness* at twenty, a volume which was violently attacked by the *Edinburgh Review*

which provoked his retaliatory *English Bards and Scotch Reviewers*, which caused a great sensation because of its unsparing criticisms of the writers of the day. His *Childe Harold's Pilgrimage*, the first two cantos of which were published in 1812, at once placed him in the front rank of poets, and thenceforward to the time of his death he continued to produce poems, most of which were marked by an intense Republican sentiment, yet full of passion and charm and beauty. He made an unhappy marriage in 1815 with the daughter of Sir Ralph Milbanke, from whom he parted after a twelvemonth. He lived abroad for the rest of his life and died at Missolonghi, whither he had proceeded with a view to aiding the Greeks in their battle for national independence

C

Cable, George Washington (1844–1925), a well-known American author, born in New Orleans, the scene of many of his best works Among his writings were *Ole Creole Days* (1879), *Strange Stories of Louisiana* (1889), and serious sociological studies such as *The Negro Question* (1890).

Cabot, John (*c.* 1455–*c.* 1498), Genoese explorer who settled in Bristol and sailed westwards under letters-patent from Henry VII of England in 1497 Discovered Newfoundland and Nova Scotia, believing them to be part of Asia, and may have reached the mainland of America before Columbus did. His son —

Cabot, Sebastian (*c.* 1483–1557) was born in Venice, and in 1509 sailed in search of a north-west passage to Asia. Sailed as far as the entrance of Hudson Bay Entered Spanish service in 1512, and in 1518 was appointed chief pilot. Spent several years exploring the Plate and Parana rivers Re-entered English service in 1548 and organised expedition to seek a north-east passage to open up trade with India, which resulted in trade with Russia English claim to North America is founded on the voyages of the Cabots.

Cabral, Pedro Alvarez (*c* 1467–*c.* 1520). Portuguese navigator, friend of Vasco da Gama, and discoverer of Brazil, which he named "Terra da Santa Cruz"

Cadbury, George (1839–1922), was a prominent member of the Society of Friends, a well-known Philanthropist, and ardent Liberal, and head of the firm of Cadbury Bros., Bourneville He took the lead in the Garden City project, and the village of Bourneville may be regarded as the first enterprise of the character to be practically completed. it has an endowment of over £200,000

Cadogan, Rt. Hon. Sir Alexander, O.M., G.C.M.G., K.C.B. (b. 1884), entered the Diplomatic Service in 1908, and succeeded Lord Vansittart as permanent Under-Secretary of the Foreign Office in 1938. Helped to draft the Charter of the United Nations Organisation, and became Great Britain's first permanent representative on the Security Council. Chairman of the B.B.C., 1952–7

Caedmon, the first English Christian poet, lived in the seventh century and, according to Bede, was first a cowherd and later a monk at Whitby His poetry was based on the Scriptures

Caesar, Caius Julius (*c.* 101–44 B.C.), Roman general. Was appointed successively military tribune, quæstor in 68, ædile in 65, and pontifex maximus in 63. A year later he was prætor, and later formed one of the first triumvirate He invaded Gaul and Britain, in the Civil War defeated Pompey, and in the Alexandrine war met Cleopatra, and established her firmly on the throne of Egypt. On his return to Rome in 44 the crown was offered to him, a circumstance which caused the aristocratic party to compass his assassination.

Caine, Sir Thomas Henry Hall, C.H., K.B.E (1853–1931), author of numerous novels, including *The Deemster*, *The Manxman*, *The Christian*, *The Prodigal Son*, *The Woman Thou Gavest Me*, the latter being one of the fiction sensations of 1913.

Calderón de la Barca, Pedro (1600–1681), a Spanish dramatist of great eminence whose plays number nearly 200. He was writer of court spectacles for Philip IV.

Callcott, Sir Augustus Wall, R.A. (1779–1844). Attained great eminence as a landscape painter.

Calvin, John (1509–1564), one of the leading Reformers of the 16th century Was born in Picardy and attained great popularity as a preacher in Paris, but was expelled, and subsequently lived at Geneva, where he continued to preach the new doctrine, giving it that special shape which resulted in the formation of the Calvinist body, distinguished by its greater austerity from that of the Lutherans.

Camden, William (1551–1623), an antiquary, historian, and master of Westminster School, whose researches, especially in the field of topography, have been of the greatest value. He became Clarencieux King-at-Arms, and was buried in Westminster Abbey The Camden Society is named after him.

Cameron, Sir David Young, R.A (1865–1945), was one of the best known of British etchers as well as an excellent landscape-painter. King's Painter and Limner in Scotland, 1933–45

Cameron, Richard (*c.* 1648–1680), one of the Scottish 17th-century preachers who raised the standard of revolt in defence of the Solemn League and Covenant; he was, after many vicissitudes, slain in combat near Aird's Moss, Ayrshire, in 1680. The members of the Reformed Presbyterian Church were afterwards called Cameronians

Cameron, Verney Lovett, C.B (1844–1894), a noted African explorer who was the first to cross the African continent from east to west. Explored Lake Tanganyika, and made many valuable geographical discoveries. In 1872 went out to find Livingstone, and in 1873 met a party of natives bearing the dead body to the coast

Camillus, Marcus Furius (446–365 B.C.), was five times Dictator of the Roman Republic, a supporter of the patrician order, and one of the most successful of the Roman generals He died of the pestilence, 365 B.C.

Camm, Sir Sydney, C.B.E. (b 1893), designer of the Hawker Hurricane Fighter aeroplane

Cammaerts, Emile, C.B.E. (1878–1953), Belgian poet, critic, historian and dramatist. Born in Brussels, he settled in England in 1908, and became Professor of Belgian Studies and Institutions in the University of London He became widely known during the war of 1914–18 for a series of Belgian poems.

Camões, Luis Vaz de (1524–1580), the author of *Os Lusiadas*, the great epic poem of Portugal, which sets forth the adventures of the discoverers of India, and celebrates the achievements of the principal personages in Portuguese history

Campbell, Sir Colin. *See* **Clyde, Baron.**

Campbell, Sir Malcolm (1885–1948), the racing driver who held the land-speed record of 301 m p h (1935) and water-speed record 141·7 m p h (1939) His son **Donald M. Campbell, C.B.E.**, broke his own world water-speed record on May 14, 1959, averaging 260·35 m p h.

Campbell, Beatrice Stella (Mrs Patrick Campbell) (1865–1940), was a celebrated actress Her first London appearance was in 1890 in *The Hunchback*. She made her film debut in 1930 in *The Dancers*

Campbell, Thomas (1777–1844), Scottish poet who at 22 published *The Pleasures of Hope*. He was one of the founders of University College, London, and is chiefly remembered for his war songs and the poems *Ye Mariners of England*, *The Battle of the Baltic*

Campbell-Bannerman, Rt. Hon. Sir Henry, G.C.B. (1836–1908), Prime Minister in the Liberal Ministry from December 1905 until shortly before his death in April 1908. His Government at once faced a General Election and obtained a very large majority. Notable events of his period of office were the Trades Disputes Act, 1906, the Deceased Wife's Sister Act, 1907, and the simmering quarrel between the Liberals and the House of Lords, while the settlement of the South African problem was to a great extent due to his efforts. His Ministry contained a galaxy of talent—Grey, Haldane, Lloyd George, Asquith, Morley, Churchill—and was mainly held together by his personal popularity.

Camus, Albert (1913–60), important French writer, native of Algiers, whose works show the influence of existentialism. The Nobel Prize was awarded him in 1957 for "his important literary work, which has with penetrating seriousness thrown light on the problems of human conscience in our times." His most well-known novels are *l'Etranger* (1942), *La Peste* (1947), *l'Homme Révolté* (1952). Killed in car crash.

Canaletto, Giovanni Antonio (1697–1768), Venetian artist who excelled in the art of architectural painting. Some of his work is in the National Gallery, and there is a fine collection at Windsor.

Canning, Rt. Hon. George (1770–1827), entered Parliament in 1793 and became a great orator and a devoted adherent of Pitt, under whom he served first as Under-Secretary of State and later as Treasurer to the Navy. He was Secretary for Foreign Affairs under the Duke of Portland, and in 1827 became Prime Minister, but died four months later.

Cannizzaro, Stanislao (1826–1910), Italian chemist who carried forward the work of Avogadro in distinguishing between molecular and atomic weights He was professor of chemistry at Alexandria, Geneva, Palermo, and Rome, became a member of the Italian senate, and did much to develop scientific education.

Canova, Antonio (1757–1822), an Italian sculptor, leader of the classical revival in Italy, whose works achieved the first eminence.

Canton, John (1718–72), English physicist and schoolmaster, the first to verify in England Franklin's experiments on the identity of lightning with electricity. He was the first to demonstrate that water is compressible and produced a new phosphorescent body (Canton's phosphorus) by calcining oyster shells with sulphur

Canute the Great (995–1035), invaded England with a Danish force, and in 1013 succeeded in dethroning Ethelred the Unready, and setting up his own father, Sweyn, in Ethelred's stead. Sweyn dying in 1014, Canute claimed the crown, but it took him some years to establish himself firmly

Capablanca, José Raoul (1888–1942), world's chess champion, 1921–27, defeated by Alekhine

Caractacus was the name by which a Prince of ancient Britain became famed for his resistance to the Romans in the 1st century He was ultimately captured and taken prisoner to Rome where the Emperor Claudius was so moved by his dignity of bearing that he pardoned him.

Carey, William, D.D. (1761–1834), the first Baptist missionary to proceed to India, and from 1800 to 1830 Professor of Oriental Languages at Port William College, Calcutta. Became famed as an Oriental scholar, and published twenty-four different translations of the Scriptures.

Carissimi, Giacomo (1604–74), an Italian composer who is historically important for his development of the sacred cantata and the oratorio. Was maestro at Assisi, and later at Rome. The best collection of his works are in the National Library in Paris, and in the library of Christ Church, Oxford

Carlyle, Thomas (1795–1881), was educated at Edinburgh University, and, after passing through some years of teaching drudgery, settled in London in 1824 and began the career of a serious man of letters; but, marrying Jane Welsh in 1826, he returned to Scotland and spent the next few years on a farm at Craigenputtoch, coming to London again in 1834. His *Sartor Resartus* was published in 1833. In 1837 he gave lectures in London, and in 1839 his *Chartism* appeared. His *French Revolution*, *Past and Present*, *Life and Letters of Oliver Cromwell*, *Latter-Day Pamphlets*, and *Frederick the Great* were works of noble conception.

Carnegie, Andrew (1835–1919), b. in Dunfermline, emigrated to America with his father in 1848, and after passing through much menial employment became connected with the Pennsylvania Railroad as Divisional Superintendent at Pittsburg, and ultimately established the Carnegie iron works, from which he retired in 1901 with a fortune of many millions. His munificent gifts for Free Libraries, educational work, and charitable objects are well known.

Carnot, General Lazare Nicolas Marguerite (1753–1823), was a prominent figure in the French Revolution, and author of an important work on fortification.

Caroline, Queen, wife of George IV. (1768–1821), was married to her husband in 1795 while he was Prince of Wales. The royal couple lived together only a very short time. When George succeeded to the throne in 1820 the Queen took steps to assert her position, and the King retaliated by having a Bill introduced to dissolve the marriage; the result was the famous trial before the House of Lords, when Lord Brougham distinguished himself by a most eloquent defence of the Queen. The Bill was passed by a narrow majority, but public feeling was too strong on the side of the Queen to admit of its being enforced.

Carrel, Dr. Alexis (1873–1944), American surgeon who won the Nobel Prize in 1912 for his remarkable achievements in suturing blood vessels and in the transplantation of organs. Member of the Rockefeller Institute for Medical Research 1906–44. A Frenchman by birth.

Carroll, Lewis. (*See* **Dodgson, Charles Lutwidge.**)

Carson of Duncairn, Lord, P.C. (1854–1935), had a highly successful career first at the Irish and then at the English Bar. Solicitor General for Ireland 1892, and for England 1900–6, Attorney General 1915; First Lord of the Admiralty 1917; Lord of Appeal 1921–29 Led a semi-militant organisation against the Home Rule Bill 1912–14.

Carter, Howard (1873–1939), Egyptologist and archaeologist who was associated with the 5th Earl of Carnarvon in discovering in 1922 the tomb of Tut-Ankh-Amen in the Valley of Kings, Egypt.

Cartier, Jacques (1494–1557), 16th-century navigator, born at St. Malo, whose exploration of Canada, and especially of the gulf and river of St. Lawrence, proved of great geographical importance

Cartwright, Edmund, D D. (1743–1823), invented the power loom, and also a wool-combing machine. Although these inventions were developed into fortune-making instruments, they benefited their inventor but little, and in 1809 Parliament made him a grant of £10,000. In 1904 a Cartwright Memorial Hall was opened at Bradford, the gift of Lord Masham.

Caruso, Enrico (1873–1921), a celebrated tenor, was born in Naples, and made his first operatic appearance in his native city. His success was unbounded.

Carver, George Washington (1864–1943), American negro agricultural chemist of world repute.

Casabianca, Louis de (c 1754–1798), captain of the French flagship *L'Orient* at the Battle of the Nile. He and his ten-year-old son died together in the burning ship, refusing to quit the vessel.

Casals, Pablo (b 1876), the famous Spanish violoncellist and conductor, who made his first appearance in Paris and London in 1898. He exiled himself from Spain in 1938 as a protest against dictatorship.

Cassatt, Mary (1845–1926), American painter and etcher. Spent most of her life in France, greatly influenced by the Impressionists and enjoyed friendship of Degas and Manet. Motherhood was her favourite subject.

Cassini, the name of a French family of Italian origin, distinguished for their services to astronomy and geography, who through four generations (1671–1793) were heads of the Paris Observatory.

Cassius, Caius Longinus, a distinguished Roman general who opposed the Dictatorship of Julius Cæsar, and took part in his murder. He died in 42 B.C., after being defeated by Mark Antony.

Castellani, Sir Aldo, Hon. K.C.M.G. (b. 1877), Italian scientist and foremost living authority on tropical diseases. Discovered the cause of sleeping sickness and other tropical diseases.

Castlereagh, Viscount, K.G., P.C. (1769–1822), British Minister of War and Foreign Secretary during the Napoleonic wars, who incurred much unpopularity because of the disastrous condition of home affairs. Succeeded to the Marquessate of Londonderry in 1821, and ended his life by suicide the following year.

Castro, Fidel (b. 1927), popular revolutionary hero of Cuba who came to power in 1959 with two main aims: (*a*) to end dictatorship, injustice and

poverty, and (b) to end dependence on America. Far-reaching agrarian reforms are in progress, but in fulfilling the second aim he has come into conflict with American interests.

Catherine, St., was the name borne by a celebrated virgin of Alexandria, who was put to death in 307 for professing Christianity, being, according to some accounts, tortured on a spiked wheel before execution, though other authorities aver that the intended torture was miraculously prevented. From this we get the term "St. Catherine's wheel." Festival 25 Nov.

Catherine of Aragon (1485–1536), first wife of Henry VIII., was previously the wife of Arthur, Henry's elder brother, who died shortly after the marriage. She was the daughter of Ferdinand and Isabella of Spain, aunt of the Emperor, Charles V, and mother of Mary Tudor. Henry's failure to obtain papal consent to the dissolution of their marriage precipitated the Reformation crisis in England.

Catherine the Great (1729–96), Empress Catherine II of Russia. Daughter of a Prussian general, she married in 1745 the future Peter III, a weakling, later deposed and murdered Intelligent, cultivated, autocratic, she proved herself a capable ruler for a time but was hampered and opposed by the landed interests and, despite plans for reform, her reign was marked by imperialist expansion and extension of serfdom.

Catherine de' Medici (1519–1589), wife of Henry II. of France, and a woman of commanding power and influence, especially during her Regency, which continued while her son Charles IX was in his minority. Her antagonism to the Protestants may have led to the Massacre of St. Bartholomew In spite of her cruelty, she was an able woman, and showed a great appreciation of art and literature

Cato, Marcus Porcius (234–149 B C.) a Roman statesman, soldier, and writer, of strict virtue, simplicity and wisdom, who strongly condemned the luxury of his time and carried out his duties as Censor so rigorously that he became known as "Censorious"

Catroux, Gen. Georges (b. 1879), French soldier, who saw much service with the Foreign Legion. When Gov.-Gen. of Indo-China declared adherence to the Free French, 1940, and became C-in-C. Free French in Levant., 1941–43. French Ambassador to U S.S.R., 1945–46.

Catullus, Caius Valerius (87–54 B C.), an elegant Roman poet, whose lyrics to Lesbia are amongst the finest compositions of the kind in literature.

Cavell, Edith Louisa (1865–1915), a British nurse and patriot who assisted wounded British soldiers to escape over the Dutch frontier from Belgium during the Great War. She was shot by the Germans.

Cavendish, Hon. Henry, F R.S. (1731–1810), English chemist and physicist who made researches into the nature of gases. Is chiefly remembered for his discovery of the chemical composition of water. He also discovered hydrogen (1766).

Cavour, Count Camillo Benso (1810–1861), a distinguished Italian statesman, who, as Premier to Victor Emmanuel, did much for the unification of Italy.

Caxton, William (1422–1491), was born in Kent and employed in commerce for a time. While visiting Flanders he obtained an insight into the then new invention of printing, and afterwards set up a printing-press of his own at Westminster.

Cecil of Chelwood, 1st Viscount, P.C., Q C., C H. (1864–1958), third son of the third Marquess of Salisbury. Took part in the Peace Conference, 1919, and helped to draft the Charter of the League of Nations. Awarded Nobel Prize for Peace, 1937.

Cecilia, Saint, the patron saint of music, martyred in Sicily under Marcus Aurelius (c. 176). She became patroness of music only about the beginning of the 15th century when painters showed her with harp, organ, or other musical instruments. Her festal day is Nov. 22.

Cellini, Benvenuto (1500–71), Italian sculptor and goldsmith of the later Renaissance Possessed remarkable talent and skill, and produced innumerable works of great accomplishment, decorative and exquisite in detail, most of which have perished. Some examples are to be found in the Vienna Museum, the Louvre, and in the Metropolitan Museum. His famous bronze statue *Perseus with the Head of Medusa* can be seen in the Loggia dei Lanzi, Florence. His fame, however, rests more on his *Autobiography*, which gives a vivid account of the period and of his own craft.

Celsius, Anders (1701–44), Swedish physicist and astronomer who became professor of astronomy at Uppsala in 1730 and worked at the new Uppsala observatory, 1740–44. He invented the Centigrade or Celsius thermometer with freezing point of water at the zero-degree and boiling point at the 100-degree point.

Cervantes Saavedra, Miguel de (1547–1616), famous throughout the world as the author of *Don Quixote*, a wonderful study of feudalism in decay in which is to be found much social science. He had a most adventurous career, taking part in many military expeditions, and not turning to literature until his retirement from the profession of arms. In spite of the great success of his work he died in poverty and two centuries went by before he was honoured.

Cézanne, Paul (1839–1906), a French painter of power and originality, and intimate friend of Emile Zola. The famous portrait known as *La Vieille au Chapelet* was purchased by the National Gallery in 1953 and the Courtauld Collection in London includes, among others, the *Montagne Sainte Victoire*, and the *Lake of Annecy*.

Chadwick, Sir James, F.R.S. (b 1891), physicist, one of Rutherford's most brilliant collaborators in the field of atomic research. Discovered the neutron in 1932, one of the main steps in the discovery of the fission process which led to the production of the atom bomb. Member (part-time) U.K. Atomic Energy Authority, 1958– ; Master of Caius College, Cambridge; co-author of *Radiations from Radioactive Substances*

Chaliapin, Fedor Ivanovich (1873–1938), a world-famous Russian opera singer, a bass with great dramatic gifts.

Chamberlain, Rt. Hon. (Arthur) Neville (1869–1940), son of Joseph Chamberlain by his second wife. Prime Minister, 1937–40. His appeasement policy, which culminated in the Munich Agreement of 1938, has been the subject of much criticism.

Chamberlain, Rt. Hon. Joseph (1836–1914), did much active municipal work at Birmingham. In 1876 he entered Parliament, and at first was an enthusiastic Liberal with Republican tendencies and served in various offices under Mr. Gladstone. When the Home Rule split occurred, he became the most active member of the Liberal-Unionist party. In 1895 he accepted office as Secretary of State for the Colonies under Lord Salisbury, and in that post won a great reputation, notwithstanding the fact that during his term of office he had the Boer War to contend with. In May, 1903, he caused great sensation by suddenly advocating a scheme of fiscal reform, involving a partial return to Protection. This policy was afterwards adopted as one of the leading planks of the Unionist platform.

Chambers, Sir William, R A. (1726–1796), a British architect, who rebuilt Somerset House in 1775. He also laid out Kew Gardens and designed the Pagoda there.

Chaminade, Cécile (1857–1944), French pianist and composer of orchestral music, ballets, songs, and charming piano pieces.

Champlain, Samuel de (1567–1635), a French navigator who founded Quebec in 1608, and in the following year discovered the lake known by his name.

Chantrey, Sir Francis Legatt, R.A. (1781–1842), a renowned English sculptor who contributed many fine statues to Westminster Abbey and St. Paul's. His famous "Sleeping Children" tomb is in Lichfield Cathedral. He left a considerable fortune to the Royal Academy for the purchase of works of art executed in Gt. Britain. The collection is in the Tate Gallery

Chaplin, Charles Spencer (b. 1889), who gained world-wide fame as a film-star comedian, was born in London and appeared on the variety stage at the age of seven, going to the U.S.A. in 1910. He first appeared on the films in 1913. His most famous films include *The Tramp*, *Shoulder Arms*, *The Kid*, *The Gold Rush*, *The Circus*, *City Lights*, *The Great Dictator*, *Modern Times*, *Monsieur Verdoux*, and *Limelight*. His art is universally appreciated. In 1953 de-

cided not to return to America but to live in Switzerland.

Chapman, Sydney, M.A., D.Sc., F.R.S. (b. 1888), mathematician and geophysicist who has made contributions of the highest importance to the kinetic theory of gases, terrestrial magnetism, and the phenomena of the upper atmosphere. Chief Prof. of Mathematics, Imperial College of Science, 1924–46. Pres. Int. Comm. which organised the International Geophysical Year.

Chapman, George (1559–1634), an Elizabethan dramatist, who acquired more fame by his translation of Homer than by his plays. Keats's sonnet *On Reading Chapman's Homer* is a splendid tribute to the old dramatist.

Charcot, Dr. Jean Baptiste Etienne Auguste (1867–1936), a famous French explorer, who in 1903–05 and 1908–10 commanded expeditions which carried out important work in mapping, sounding, etc., in the South Polar regions. Charcot Island in the Antarctic Ocean, which he discovered in 1905, is named after him.

Chares (*c.* 300 B.C.), Rhodian sculptor. He was the sculptor of the Colossus of Rhodes, a gigantic bronze statue of the Sun-God, and one of the Seven Wonders of the World. The statue was destroyed after 56 years, in the earthquake of 224 B.C.

Charlemagne (" Charles the Great ") (742–814), a wise and powerful ruler, general and statesman, who from being King of the Franks became Emperor of the Romans, and governed an empire comprising Gaul, Italy, and large parts of Spain and Germany.

Charles, Jacques Alexandre César (1746–1823), French physicist, the first to use hydrogen gas in balloons and who anticipated Gay-Lussac's law of the expansion of gases on heating.

Charles Edward (Stuart) (1720–1788), the " Young Pretender " as he came to be called, grandson of James II., and the hero of 1745, lived in exile after Culloden, and his later career was mainly one of dissipation.

Charles I. (1600–1649), King of England, Scotland, and Ireland (1625–49), succeeded his father James I in 1625. His marriage to the Catholic princess, Henrietta Maria, sister of Louis XIII. of France, displeased the English public. He was in continual trouble with his ministers and parliament. Cromwell's career began in his reign. He was beheaded in front of the Banqueting House at Whitehall, Jan 30, 1649.

Charles II. (1630–1685), King of England, Scotland, and Ireland (1660–85), second son of Charles I. After defeat by Cromwell at Worcester (1651) escaped to France, restored to throne, 1660. During his reign Pepys was recording the great London plague of 1665, and the fire of 1666, Wren was building St. Paul's, John Bunyan was writing his *Pilgrim's Progress* and Milton his *Paradise Lost*, Newton was a fellow of the Royal Society (founded by Charles) and England was becoming a great sea power. Famed as the " Merry Monarch " because of his pleasure-loving ways. Dabbled in chemistry and probably died of mercury poisoning.

Charles V. (1500–1558), Hapsburg ruler, succeeded his grandfather, Maximilian I, as emperor of the Holy Roman Empire, and as heir to Ferdinand and Isabella succeeded to Spanish Crown. Administering such vast dominions involved him in many struggles: rivalry with Francis I of France led to four wars. Crushed revolt of peasants (1525). Augsburg settlement (1553) brought Lutherans religious equality with Roman Catholics. Retired to a monastery in Spain (1557).

Charles XII of Sweden (1682–1718), a brave but impulsive monarch whose reign was distinguished by the great Nordic War against Denmark, Poland, and Russia. Peter the Great decisively defeated him at Poltava in 1709. In 1718 he invaded Norway and was killed while besieging the fortress of Fredrikshald.

Chateaubriand, François René, Vicomte de (1768–1848), French writer and diplomat who in the midst of an adventurous and somewhat eccentric political career wrote a number of stories, poems, and essays which reflect the richness of his personality and give him a unique place in French literature. He was the friend of Mme Récamier for many years. His last years were spent in writing *Mémoires d'outre-tombe* (memoirs from beyond the tomb).

Chatham, William Pitt, Earl of (1708–1778), had a long and distinguished career as a statesman, and was the most eloquent Parliamentarian of his time. In the long conflict with France that preceded the American War of Independence, Chatham showed great resourcefulness and vigour, but his patriotic efforts were of little avail against the obstinacy of the King and his party, and he ultimately retired from contention, only making a last appearance in the House of Lords to urge a greater resistance to the war with the American Colonists, and, after a powerful speech, fell back in an apoplectic fit and died a few weeks later, being buried in Westminster Abbey.

Chatterton, Thomas (1752–1770), young English poet of remarkable talent, unappreciated until after his death. Unsuccessfully tried to pass off his writings as newly discovered ancient manuscripts and killed himself at the age of 17.

Chaucer, Geoffrey (*c* 1343–1400). Achieved immortality by his *Canterbury Tales*, giving a most graphic description of the life and characters of his time. He was buried in Westminster Abbey.

Chekhov, Anton (1860–1904), Russian dramatist and short-story writer, whose plays include *The Cherry Orchard*, *Uncle Vanya*, *The Three Sisters*.

Cherubini, Maria Luigi Carlo Zenobia Salvatore (1760–1842), a Florentine musician, for many years director of the Paris Conservatoire and composer of operas and church music. Admired by Beethoven and Mendelssohn.

Chesterfield, Earl of, K.G. (1694–1773), English statesman whose fame rests upon the letters to his natural son, Philip Stanhope, under the title *Letters to his Son*, which are full of grace, wit, and worldly wisdom.

Chesterton, Gilbert Keith (1874–1936), was one of the most active of our modern writers. Contributed to the *Illustrated London News*, etc., and kept himself in evidence in many literary and journalistic quarters, handled social questions, art, politics, and criticism with dexterity and audacity. Published studies of the lives and works of Robert Browning and Charles Dickens. Completed writing his own autobiography shortly before his death.

Chevalier Albert (1861–1923), English music-hall comedian of great originality, celebrated for his coster sketches and songs.

Chevalier, Maurice (b. 1889), French stage and film actor.

Chiang Kai-shek, Generalissimo (b. 1887), former President of China and member of the Kuomintang Party. Emerged from the welter of events succeeding the death of Sun Yat Sen in 1925 as the leading man in China, a position he maintained for a quarter of a century of trouble and bloodshed. The successful conclusion of the long and costly Japanese war was followed by civil war with the Communists in North China. In January 1949 he withdrew from the office of President following military defeat by the Communists and the collapse of the Kuomintang régime.

Chippendale, Thomas (*c.* 1717–1779), a celebrated designer of furniture whose examples are now highly prized and fetch big prices. He was a native of Worcestershire, but made his name in London, having a shop in St. Martin's Lane.

Chirico, Giorgio de (b. 1888), painter associated with surrealism, born in Greece of Italian parents.

Chopin, Frédéric François (1810–1849), Polish pianist and composer, son of a French father and Polish mother. He has been called " the poet of the piano " because of the originality and delicacy of his playing. His music, composed mostly for the piano, includes preludes, mazurkas, impromptus, nocturnes, études, sonatas, and a barcarolle and a berceuse. He enjoyed Paris intellectual and musical society, and played in numerous concerts all over Europe. He died of consumption and was buried in Père-Lachaise, next to his friend Bellini.

Chou-En-lai, General (b. 1898), Prime Minister of the Chinese People's Republic since 1949; Foreign Min. 1949–58. Took important part in Geneva Conference of 1954, where his talents for negotiation helped to bring to an end the 8 years' war in Indo-China and the new China into world diplomacy.

Chrysostom, St. John (347–407), a father and

saint of the Greek Church who was made Archbishop of Constantinople and was famous for his eloquent preaching and persuasive writing.

Churchill, Rt. Hon. Lord Randolph (Henry Spencer), P.C. (1849–1895), was the third son of the seventh Duke of Marlborough. Entered Parliament in 1874, and four years later became prominent on the Conservative side for his scathing attacks on what he called the "Old Gang" of his own Party, and was one of Mr Gladstone's most severe critics. In 1885 he became Secretary for India, and in the following year was Chancellor of the Exchequer and Leader of the House of Commons, but after a few months of brilliant work resigned on some difference of opinion with his colleagues, and never again held office

Churchill, Rt. Hon. Sir Winston (Leonard Spencer), K.G, O M, C H, C L, M P (b 1874), British statesman, soldier, and author, son of the last-named Prime Min. and Min. of Defence, 1940–45. Leader of the opposition, 1945–51 and Prime Min. from 1951 until his retirement in 1955. M P. for Woodford since 1945. M P. for the Epping Division of Essex, 1924–45. Claude Lorrain (1600–1682), the most famous landscape painter of his century. His real name was Claude Gelée, and he was born at Chamange in the Vosges, going from France to Rome as a lad and there laying the foundation of his worldwide celebrity He lived in Rome most of his life

Claudius I. (10 B C–A D 54), Emperor of Rome, who succeeded his nephew Caligula when he was murdered He was the grandson of Tiberius Claudius Nero, erected many imposing buildings in Rome, and visited Britain. In his later years he became the tool of favourites, and was poisoned by his wife Agrippina

Clausewitz, Gen. Carl von (1780–1831), Germany's greatest military expert His classic book *Vom Kriege*, which expounds his theories on war, dominated Prussia in the nineteenth century, and is still studied in military schools throughout the world

Clemenceau, Georges Eugène (1841–1929), a prominent French statesman and editor of strong Radical tendencies who supported General Boulanger for a time and then bitterly opposed him. Was still a leading exponent of French Radicalism, though he sacrificed his independent position to become Premier and Minister of the Interior in October, 1906–1909, Prime Minister and Minister for War, France, 1917–20. Was a great orator, and a sturdy defender of Dreyfus

Clemens, Samuel Langhorne ("Mark Twain") (1835–1910). After the Civil War drifted into journalism, making himself popular as a humorist in 1869 by his *Innocents Abroad*, the result of a trip to Europe. His other works include *A Tramp Abroad*, *Tom Sawyer*, *Huckleberry Finn*, and *Pudd'nhead Wilson*.

Cleopatra (69–30 B C.), daughter of Ptolemy XI, the sixth queen of Egypt by that name, a brilliant, ambitious woman of captivating charm. On the death of her father in 51 she became

joint sovereign with her younger brother Ptolemy XII, whom she married in accordance with Egyptian custom. She was banished to Syria, but obtaining the help of Cæsar, led a revolt and won the kingdom for herself. Cleopatra and Cæsar became lovers. In 47 she bore him a son Cæsarion (later Ptolemy XIV) and followed him to Rome. After the murder of Cæsar she returned to Egypt, where in 41 she was summoned to meet the triumvir Mark Antony. He fell in love with her and became enslaved. She bore him twins Alexander Helios and Cleopatra Selene. He deserted Octavia his wife and broke with Octavian (later Augustus), his brother-in-law, in an attempt to re-establish the power of Egypt. Antony and Cleopatra were, however, defeated at Actium in 31 B.C. and at Alexandria. Antony fell upon his sword, and Cleopatra, unable to influence Octavian, killed herself by allowing an asp to bite her. The drama of her life has been described by Shakespeare in *Antony and Cleopatra* and by Shaw in *Cæsar and Cleopatra*.

Clive, Robert, Lord (1725–1774), went out to India as a clerk in the service of the East India Company when 17, and during the diplomatic difficulties which arose between England and France attracted the attention of his superiors by some able suggestions for the curbing of the French influence. In the war that followed he was given a command and displayed such remarkable military genius that he virtually became Commander-in-Chief. In the troubles that followed with the native rulers, he was equally resourceful, and succeeded in laying the foundation of the British empire in India on a secure basis. On his return to England in 1760 he was raised to the peerage His latter years were marked by mental disturbance and ultimately he committed suicide.

Clovis (*c.* 465–511) was the founder of the Merovingian-line of Frankish kings, and a convert to Christianity. He defeated the Burgundians and West Goths, and fixed his court at Paris.

Clyde, 1st Baron, Colin Campbell, K C.B. (1792–(1863), a British Field-Marshal who served in the Peninsular and Crimean wars and made a great reputation as Commander-in-Chief in India during the Mutiny.

Cobbett, William (1763–1835), a politician and controversialist, who, through the medium of his *Political Register*, attacked both Radical and Tory in turn. Entered Parliament in 1832. In 1830 his *Rural Rides* were published in book form.

Cobbold, Cameron Fromanteel, P.C (b 1904), Governor of the Bank of England, 1948–61, Lord Chamberlain, 1962– .

Cobden, Richard (1804–1865), the son of a Sussex farmer, who afterwards became a commercial traveller, and during the Corn Law Agitation came into great prominence as an advocate of Free Trade. He devoted himself so completely to this cause, that for some years he entirely neglected his business affairs and in recognition of his services a subscription of £80,000 was raised for him in 1845, and in 1860 a further sum of £40,000. He entered Parliament in 1841, and except for an interval of two years remained a member till his death. In 1860 he negotiated a commercial treaty with France which was of great benefit to the trade of this country. Titles and other honours were offered to him but declined.

Cochran, Sir Charles Blake (1872–1951), a prominent English theatrical manager and producer who began as an actor in America. Among his many successes were *Bitter Sweet*, *Cavalcade*, and a number of brilliant revues.

Cockroft, Sir John Douglas, K.C B , O.M., C.B E., M.A., Ph.D., F.R.S. (b. 1897), Cambridge nuclear physicist who shared with Dr. E. T. S. Walton the 1951 Nobel Prize. Dir. Atomic Energy Research Estab. at Harwell, 1946–58; Member (Research) U.K. Atomic Energy Authority, 1958–59, Member Advisory Council on Scientific Policy, 1959– ; Master of Churchill College, Cambridge.

Cocteau, Jean (b. 1891), French writer and artist whose achievements in widely varied forms of art have been prodigious. Elected to the Académie Française in 1955.

Cody, Samuel Franklin (1862–1913), British aviator, born in U.S.A., but became a naturalised British subject. He was the first man to fly in Great Britain—making a flight of 27 minutes in October 1908 in the first practical British flying-machine of his own make. Was killed while flying in 1913.

Cody, William Frederick (1846–1917), American showman, known as "Buffalo Bill," who in 1883 founded his great Wild West show.

Cohn, Ferdinand Julius (1828–1898), the famous German bacteriologist, of which science he was the virtual founder.

Coke, Sir Edward (1552–1634), Attorney-General under Elizabeth and Chief Justice under James I; great rival of Francis Bacon. His extensive legal erudition added many new interpretations to the Common Law system. Among his publications are his four *Institutes*, the first of which (*Coke upon Littleton*) is very famous.

Colbert, Jean Baptiste (1619–83), French statesman, who fostered new industries and encouraged commerce, endeavoured to reform the finances, and established the French Navy on a sound basis. A patron of literature, science, and art.

Cole, George Douglas Howard, M.A., (1889–1959), British economist, sociologist, and writer; Chichele Professor of Social and Political Theory at Oxford, 1944–57; Chairman Fabian Society, 1939–46, Pres. Int. Society for the Study of Socialism from 1956 until his death. Among his numerous writings on social and economic problems are *The Intelligent Man's Guide through World Chaos* (1932), *The Post-War Condition of Britain* (1956), *The Case for Industrial Partnership* (1957), *A History of Socialist Thought* (5 vols.).

Colette (Sidonie Gabrielle Claudine Colette) (1873–1954), author of a number of highly successful novels including the famous *Claudine* stories, *Chéri* and *La Fin de Chéri*. Grand Officier de la Légion d'Honneur (1953)

Collier, Hon, John (1850–1934), English painter who became highly popular for his "problem" pictures. He is best remembered, however, as a distinguished portraitist.

Collingwood, Lord (1750–1810), British admiral whose ship the *Royal Sovereign* led the fleet to battle at Trafalgar and who on Nelson's death assumed the command.

Collins, Michael (1890–1922), brilliant and daring Irishman, leading spirit of the Sinn Fein political movement. Took part in the Easter Rebellion and organised the guerilla warfare which eventually led to the breakdown of British government and to the Anglo-Irish Peace of Dec. 6, 1921. Killed in ambush by Republicans after his return from England.

Collins, William, R.A. (1788–1847), a noted landscape and figure painter, and father of Wilkie Collins.

Collins, William Wilkie (1824–1889), the novelist, was for many years associated with Charles Dickens, and wrote *The Dead Secret*, *The Woman in White*, and *No Name*.

Colt, Samuel (1814–1862), of Hartford, Connecticut, invented the revolver and patented it in 1835. It was some time before its utility was recognised, but after being used with great effect in the war with Mexico it was universally adopted.

Columba, St. (521–597), the founder of the monastery of Iona, was a native of Ireland. From his lonely island shrine he made frequent missionary journeys to the Highlands of Scotland,

where he made many converts and was greatly revered.

Columbus, Christopher (*c.* 1446–1506), the famous Italian navigator, who, prevailing upon Ferdinand and Isabella of Spain to bear the expense of an expedition of discovery, set out on his first voyage in 1492. He first discovered the Bahamas, Cuba, and other West Indian islands, and, on his third voyage, in 1498, landed on the lowlands of South America.

Colvin, Sir Sidney (1845–1927), friend of R. L. Stevenson and biographer of Keats. Was Keeper of Prints at the British Museum, 1884–1912. Author of numerous works on art and literature.

Comenius, Johann Amos (1592–1670), famous Czech educationist. Was the first advocate of the "direct" method of teaching languages, of the use of pictures in education, and of the teaching of science.

Compton, Prof. Arthur Holly (b 1892), American physicist whose work on X-rays led to the discovery of the so-called "Compton Effect," for which he shared with C. T. R. Wilson the 1927 Nobel Prize for Physics. He has also made important cosmic-ray investigations. His brother **Karl Taylor Compton** (b. 1887) is also a physicist who has taken an important part in radar and atomic bomb research.

Compton-Burnett, Ivy, British novelist, whose books deal with family relationships and include *Men and Wives*, *A House and its Head*, *Man Servant and Maid Servant*, *The Present and the Past*, *A Heritage and its History*.

Comte, Auguste (1798–1857), a French philosopher founder of positivism, and father of social philosophy.

Condé, Louis II., de Bourbon, Prince de, "The Great Condé" (1621–1686), was a distinguished military commander. Victor of Rocroi, 1643

Confucius (*c.* 551–479 B C.), Chinese philosopher and sage, founder of the great world religion of Confucianism. He was not concerned with the supernatural but appealed to reason and taught love and respect of one's fellows, superiority to ambition, charity, forgiveness, and repentance. (*See* **Confucianism, Section J.**)

Congreve, William (1670–1729), was a famous Restoration dramatist, whose comedies of manners reflect the grossness of his age only too closely, but are redeemed by the brilliancy of his wit. He was buried in Westminster Abbey.

Conrad, Joseph (1857–1924), English novelist of Polish birth whose parents were exiled to France for political reasons. He became master mariner in the British merchant service and began to write novels after he left the sea in 1884. He has a beautiful prose style and is acknowledged to be a significant figure in English literature. His novels include: *Almayer's Folly* (1895), *Lord Jim* (1900), *Nostromo* (1904). Biography by Jocelyn Baines (1960).

Conscience, Hendrik (Henri) (1912–83), the famous Flemish novelist who wrote in 1838 his beautiful work *The Lion of Flanders*.

Constable, John, R.A. (1776–1837), was a native of East Bergholt, Suffolk, and became one of the greatest of English landscape painters. He had long to wait for recognition, but ultimately attained high honour and exerted a strong influence in the development of landscape art.

Constant, Jean Joseph Benjamin (1845–1902), a famous French painter of Oriental subjects and portrait painter. His "Prisoners in Morocco," "The Harem," and "The Emir's Favourite," are among his more celebrated pictures.

Constantine the Great (*c.* 272–337). Emperor of Rome from 306 to his death. Transferred the Capital of the Empire from Rome to Byzantium, thence called Constantinople after his name.

Constantine I. (1868–1923), King of Greece, 1913–17, and 1920; married Princess Sophia of Prussia, sister of the Kaiser.

Cook, Captain James (1728–1779), an adventurous navigator, whose *Voyages Round the World* is a classic. He made many discoveries in the name of Great Britain, including the Sandwich (now Hawaiian) Islands. He was murdered at Hawaii by natives.

Cooper, Sir Astley Paston, Bt., F.R.S. (1768–1841), one of the greatest surgeons of his time, and the author of several important medical textbooks.

Cooper, James Fenimore (1789–1851), was a very popular American novelist, who from about 1820 to the time of his death produced a succession of stirring stories of adventure, which enjoyed much popularity, among them *The Spy*, *The Last of the Mohicans*, *The Pathfinder*, and *The Deer Slayer*.

Cope, Sir Arthur Stockdale, K.C.V.O., R.A. (1857–1940), was a well-known portrait painter.

Copernicus, Nicholas (1473–1543), founder of modern astronomy, was born at Thorn on the Vistula, then under Polish suzerainty. Studied at Cracow and in Italy, lectured on astronomy and mathematics at Rome and in 1512 settled at Frauenburg, where he was canon of the cathedral. He also practised medicine. His beliefs concerning the universe were set forth in his great book *De revolutionibus orbium coelestium*, which was not published until his death for fear of the storm his revolutionary theories would raise. In it he proved that the planets, including the earth, revolve round the sun.

Coppée, François Joachim (1842–1908), one of the most popular of modern French writers, who as poet, novelist and dramatist, was equally successful

Coquelin, Benoit Constant (1841–1909), eminent French actor ("Coquelin aîné"), and **Coquelin, Ernest** ("Coquelin cadet"), his youngest brother (1848–1909), were leading lights of the Théâtre Français.

Corelli, Arcangelo (1653–1713), Italian composer and the first great violinist to enjoy universal fame, founded the present art of violin playing and gave definitive form to the *concerto grosso*.

Corneille, Pierre (1606–1684) the French tragic dramatist, whose *Cid*, *Polyeucte*, *Le Menteur*, and other plays marked a new era in French dramatic production

Cornwallis, 1st Marquess (1738–1805), commander of the British forces which surrendered to the Americans, at Yorktown in 1781, thus ending the War of Independence; was twice Governor-General of India.

Corot, Jean Baptiste (1796–1875), a French landscape painter of great repute.

Correggio, Antonio Allegri da (1494–1534), the great Italian painter of the Lombard School, whose "Ecce Homo" is in the British National Gallery.

Cortes)or **Cortez), Hernando** (1488–1547), a Spanish adventurer who earned great renown by capturing Mexico for Spain, and held that country in subjection for ten years.

Cortot, Alfred (1877–1962), French pianist and conductor, best known for his playing of Chopin, Liszt, and Schumann, chorus director at Bayreuth, conducted first complete performance in Paris of Wagner's *Ring*

Cosgrave, William Thomas (b 1880), President of Executive Council, Irish Free State, 1922–32; Finance Min, 1923, Defence Min., 1924, Parl. Chairman Fine Gael, 1933–44.

Costello, John A., S.C. (b. 1891), Prime Minister of Irish Republic 1948–51 and 1954–57. When Attorney General, Irish Free State, 1926–32, helped to draft the Statute of Westminster.

Coty, René (1882–1962), President of the French Republic, 1954–8

Coulton, George Gordon, Litt. D, LL.D. (1858–1947), scholar and historian of the Middle Ages, whose main claim to fame rests upon *Five Centuries of Religion*, works in which he set forth his interpretation of monastic history in England from the Conquest to the Reformation.

Couperin. A notable family of French musicians who were organists at St. Gervais, Paris, from about 1650 until 1826. **François Couperin** (1668–1733), called "Couperin the Great," is the best known today for his harpsichord music.

Cousin, Victor (1792–1867), French educationist and philosopher who founded what is called the eclectic school of modern philosophy. He was a remarkable lecturer and his writings cover nearly the whole field of philosophy.

Cousins, Samuel, R.A. (1801–1887), the greatest mezzoprint engraver of his day, whose plates after Reynolds, Millais, Landseer, and Hogarth reach the highest point of this kind of art work.

Coverdale, Miles (1488–1568), one of the early English Reformers, was born in Yorkshire, and afterwards became a monk of Norwich and later Bishop of Exeter. He collaborated with Tyndale in translating the Bible; the Psalms still used in the Prayer Book are taken from their translation.

Coward, Noel (b. 1899), a successful English playwright and actor. His works include *Hay Fever, Private Lives, Blithe Spirit*, the operetta *Bitter Sweet* and the films *In Which We Serve, This Happy Breed*, and *Brief Encounter*.

Cowper, William (1731–1800), an English poet imbued with much piety of sentiment and a remarkable poetic talent. His *Task* is one of the great poems of the 18th century.

Cox, David (1783–1859), an eminent landscape painter—son of a Birmingham blacksmith—whose pictures are thoroughly English in spirit and treatment.

Crabbe, Rev. George (1754–1832), a poet of rural life and scenes, noted for his faithful pictures, characterisation and soundness of his sentiments.

Craig, Edward Gordon, C.H. (b. 1872), the son of the late Dame Ellen Terry, author of several books on stagecraft. Has produced many plays in England and on the Continent.

Cranmer, Thomas (1489–1556), Archbishop of Canterbury under Henry VIII, and Edward VI.; an ardent promoter of the Reformation On Mary's accession at first consented to return to the old faith, but when called upon to make public avowal of his recantation, refused, and was burnt at the stake. His great contributions were the English Bible and Book of Common Prayer.

Crawford, Francis Marion (1854–1909), an American novelist who obtained considerable eminence by his stories of Italian life, including *A Roman Singer, Saracinesca*, and *Saint Ilario*.

Crichton, James (1560–1582). Scottish adventurer who earned considerable renown for his scholarly accomplishments and charm and was called "The Admirable Crichton" He was assassinated when only twenty-two years of age in Mantua.

Cripps, Rt. Hon. Sir (Richard) Stafford, C.H., Q.C. (1889–1952), British statesman and barrister, younger son of Lord Parmoor and nephew of Beatrice Webb. In charge of post-war Britain's economic affairs. His programme was one of purposeful austerity, but his outstanding ability and masterly exposition of the economic situation won him support from all sides. He showed that liberty and planning can be reconciled in the modern world. Labour M.P. for S E. Bristol, 1931–50. Gave up a brilliant career at the bar to enter politics Ambassador to Moscow, 1940–42, and Min. of Aircraft Production, 1942–45 Went on missions to India in 1942 and 1946. Resigned his seat in Parliament and as Chancellor of the Exchequer in 1950 because of broken health; was taken to Switzerland for a cure, but he did not recover

Crispi, Francesco (1819–1901), noted Italian statesman, who aided Garibaldi and was his supporter throughout. Premier 1887–91 and 1893–96. Achieved many reforms for his country.

Crispin, St., a saint of the Roman Church and patron of shoemakers. In the 3rd century he and his brother, natives of Rome, settled in Soissons, France, and there preached Christianity, supporting themselves by shoemaking. Suffered martyrdom under Diocletian in 289, by being thrown into a cauldron of molten lead, commemorated on Oct. 25.

Croce, Benedetto (1866–1952), Italian philosopher and critic and one of the great figures of the 20th century. Devoted his long life to studying and writing, and his philosophy is expounded in the four volumes of *Filosofia dello Spirito* (which has been translated into English). He founded and edited *La Critica* in 1903, a review of literature, history, and philosophy. Strongly opposed to fascism, he was described during the war as "the grand old man who kept a torch burning in Naples which even Mussolini did not dare to extinguish."

Crœsus (died c. 546 B.C.) the last King of Lydia (560–546 B.C.), who reigned fourteen years, and acquired such immense wealth that his name has ever since been proverbial. He was a wise king, whose memory still survives in his wise sayings. Solon was his friend, and it was Solon's name that he uttered thrice while standing before the pyre on which Cyrus had condemned him to be burnt. This touched Cyrus, who spared his life and made him his companion. He succeeded his father Alyattes on the Lydian throne, 560 B.C.

Crome, John (1769–1821), known as "Old Crome," from being a humble house-painter became eminent as a painter of landscape.

Cromer, 1st Earl of, P.C., G.C.B., O M., G.C.M.G., K.C.S.I., C.I.E., F.R S. (1841–1917), a diplomatist who won celebrity in the post of British Comptroller-General in Egypt from 1883 to 1907. It was a stupendous task that he had imposed upon him, but he resolutely devoted himself to it, with the result that Egypt was lifted from financial difficulty and internal disorder to a condition of prosperity In 1908 published *Modern Egypt* and *Ancient and Modern Imperialism* in 1910.

Crompton, Samuel (1753–1827), was a poor cotton worker at Bolton who invented the spinning mule, which greatly increased the power of cotton production. Received little recognition

Cromwell, Oliver (1599–1658), Lord Protector of the commonwealth of England, Scotland and Ireland, 1653–58 Born at Huntingdon, educated at Sidney Sussex College, Cambridge, and entered parliament as member for Huntingdon in 1628 With outbreak of civil war served with the parliamentary army under Essex and won renown at Edgehill (1642). Celebrated as a great general, leader of his Ironsides for his religious toleration, and strong foreign policy. His victories include Marston Moor (1644), Naseby (1645), Dunbar (1650), Worcester (1651)

Cromwell, Richard (1626–1712), son of the foregoing, and his successor in the Protectorate.

Cromwell, Thomas (1485–1540), originally a protégé of Wolsey, rose to high office under Henry VIII, and began the suppression of the monasteries Executed after the failure of the Anne of Cleves marriage, which was part of his policy of alliance with the Protestant princes of Germany.

Crookes, Sir William, O M., F.R.S. (1832–1919) eminent British scientist whose researches in chemistry and physics led to many important discoveries and inventions. He discovered the metal thallium in 1861, invented the radiometer and the Crookes' tube, which was used by J. J Thomson and others in their researches on conduction of electricity in gases He was also an authority on sanitation President of the Royal Society, 1913–16

Cruikshank, George (1792–1878), a celebrated book illustrator who was for a time associated with Charles Dickens, and later on illustrated numerous works of other novelists of his day, showing great humour and power of character-delineation

Cummings, Bruce Frederick (1889–1917), English zoologist and man of letters Won fame with his *Journal of a Disappointed Man*.

Cunard, Sir Samuel, Bt. (1787–1865), shipowner and co-founder of the British and N. American Royal Mail Steam Packet Co which later became the Cunard Line and as a result of a merger in 1934, the Cunard-White Star Line, owners of the two largest liners afloat—the *Queen Elizabeth* and the *Queen Mary*

Cunningham of Hyndhope, Admiral of the Fleet, Viscount, K T., G C B., O M., D.S O. (b. 1883), won the D.S.O. and two bars in the first world war, C.-in-C., Mediterranean, 1939–42. Allied Naval C.-in-C., North African campaign First Sea Lord, 1943–46.

Cunningham, General Sir Alan Gordon, G C.M.G., K C.B., D S O., M.C. (b. 1887), brother of Viscount Cunningham. Directed Abyssinian campaign and commanded 8th Army, 1941 From 1945 served as the last British High Commissioner in Palestine

Cunningham, Admiral of the Fleet, Sir John Henry Dacres, G.C B., M V.O (1885–1962), C.-in-C., Mediterranean, 1943–46. First Sea Lord 1946–48.

Curie, Prof. Pierre (1859–1906) and **Madame Marie** (1867–1934) are names that have become famous as the discoverers of radium. M. Curie was a Frenchman, Mme. Curie a Pole; they were both indefatigable scientific investigators Shared the Nobel Prize for Physics 1903, while their daughter, the late Mme. Irène Joliot-Curie, shared with her husband the 1935 Nobel Prize for Chemistry, awarded for their researches in radioactivity.

Curzon of Kedleston, Marquess, K.G., P.C., G.C.S.I., G.C.I.E. (1859–1925), statesman and administrator. As a young man gained distinction as traveller and author. From 1899 to 1905 was a vigorous and outstanding Viceroy of India. Foreign Secretary, 1919–23, when he played a dominant part in the reconstruction of the Middle East and was prominent at many conferences after the first world war.

Cuthbert, St. (635–687), a famous monk who became prior of Melrose, and afterwards of Lindisfarne. For a time he lived in seclusion on one of the Farne Islands, but from 684 was Bishop of Hexham.

Cuvier, Georges Léopold, Baron (1769–1832), a French naturalist who founded a system of classification in zoology, and originated the science of comparative anatomy.

Cuyp, Albert (1620–1691), a famous Dutch landscape painter, several of whose works are in our National Gallery.

D

Daguerre, Louis Jacques Mandé (1789–1851), a French artist, who acquired fame as the inventor of the earliest photographic process, and then devoted himself to scene-painting and became part-proprietor of the Diorama in Paris

Daimler, Gottlieb (1834–1890), German inventor with N A Otto of Cologne of the Otto gas engine, and in his later years eminent as the inventor of the motor-car that is named after him

Dale, Sir Henry Hallett, O M, G.B E, F.R S, M D, D Sc, LL D, F R C P (b 1875) President, British Association, 1947, and of the Royal Society, 1940–45 Chairman of the Lister Institute of Preventive Medicine, 1942. Awarded Nobel Prize for Medicine, 1936.

Dalhousie, 1st Marquess of, P C., K T (1812–1860). The tenth Earl and first Marquess of Dalhousie was one of the most famous of India's Governors-General He controlled the affairs of India during a period of great difficulty, and annexed the Punjab after the second Sikh War, later on also annexing Nagpur Jhansi, Pegu and other States. He left India in 1856, and the following year the Mutiny broke out.

Dalton, John (1766–1844), famous chemist and mathematician, renowned for his work on the construction of matter In 1810 published his *New System of Chemical Philosophy*, in which the atomic theory was first propounded

Damien, Father (Joseph de Veuster) (1840–1889), a Belgian missionary who, going out to Honolulu in 1864, and witnessing the terrible sufferings of the lepers confined on the Island of Molokai, obtained permission to take spiritual charge of the Government settlement, and remained there working nobly for this wretched community, until in 1889 he himself was stricken with leprosy and died.

Damocles, the flatterer and favourite of Dionysius of Syracuse The legend related by Cicero concerning him is that one day after expressing envy of Dionysius, he was invited to a banquet, where he found himself sitting beneath a naked sword suspended by a single hair Hence the familiar simile " the sword of Damocles " The incident is referred to as of the first half of the 4th century B C

Damrosch, Walter Johannes (1862–1950), American musician, active in the musical development of the United States Conductor of the New York Symphony Society, 1885–1927, and composer of three operas and of incidental music to Greek plays.

Dane, Clemence, C.B E. (Winifred Ashton), author of *Regiment of Women*, *A Bill of Divorcement*, and *Will Shakespeare*, amongst many successful novels and plays.

D'Annunzio, Gabriele (1863–1938), Italian poet, dramatist and novelist. In Sept. 1919 he led an unofficial raid on Fiume and seized the port and town, when the Treaty of Rapallo was signed in 1920, he refused to recognise the Treaty, and declared war against Italy Fiume was attacked and D'Annunzio, after a short resistance, surrendered

Dante Alighieri (1265–1321), the greatest Italian poet and one of the great figures of world literature, was born in Florence in a period of political upheaval caused by the strife between Guelph and Ghibelline, which had divided mediaeval Italy for over a century Though he saw her but once or twice, he conceived an abiding love for a Florentine lady, Bice Portinari (called by Dante Beatrice), wife of Simone di Bardi, whom he first met in 1274 She died in 1290 Some of his finest work was written after he was driven from his native city in 1301 His works include the *Vita Nuova* (written 1292–93 in memory of Beatrice), his supreme masterpiece the *Divine Comedy*, begun 1308–9 and completed shortly before his death, many beautiful lyrics, and some Latin treatises

Danton, Georges Jacques (1759–1794), a famous member of the National Convention at the period of the first French Revolution Was made President of the Committee of Public Safety, but Robespierre attacked and supplanted him Danton was consigned to the guillotine shortly afterwards.

D'Arblay, Madame (1752–1840), better known as Frances (Fanny) Burney, daughter of the organist Dr Charles Burney, made a great sensation while quite young and unmarried by her novel *Evelina*, which opened the doors of Society to her and gained her the friendship of Dr Johnson

Darius was the name borne by three Persian kings The first reigned from 521 to 485 B C , and was defeated by the Greeks at Marathon The second was a natural son of Artaxerxes Longimanus, and having obtained the crown by the murder of his brother, reigned from 424 to 405 B.C The third Darius was the last of the Persian kings, reigning only from 336 to 331 B C when Alexander the Great invaded his kingdom and defeated him in two great battles. Soon after he was assassinated.

Darling, Grace Horsley (1815–1842), English heroine who by putting off in a small boat from the lighthouse on one of the Farne Islands, of which her father was keeper, saved the shipwrecked crew of the *Forfarshire*

Darnley, Earl of (1545–1567), was married to Mary Queen of Scots—as her second husband—in 1565 Two years later, after Mary had entered into an intrigue with Bothwell, he was murdered

Darwin, Charles Robert, F R S (1809–1882), the distinguished scientist, whose *Origin of Species* first clearly formulated and elaborated the theory of evolution His first work (1837) described a five years' cruise in the *Beagle*, which the Government had sent out for scientific purposes His *Origin of Species* appeared in 1859, and, though defended and supported by the scientific thought of the time generally, was much attacked by theologians. In 1871 Darwin issued his *Descent of Man*, a still further elaboration of the evolution theory. His other principal works were *The Expression Of Emotion in Man and Animals* (1872), *Insectivorous Plants* (1875), *Different Forms of Flowers* (1877), and *Worms* (1881) He was buried in Westminster Abbey

Daudet, Alphonse (1840–1897), the celebrated French humorist and novelist, all of whose works have been translated into English.

Davernant, Sir William (1606–1668), a dramatist and poet of much note in his time, who filled the office of Poet Laureate in succession to Ben Jonson. He was buried in Westminster Abbey.

David I. (1084–1153) was King of Scotland and uncle of Matilda, daughter of Henry I.; he took up arms against Stephen on his repudiation of Matilda's claims to the English crown.

David II. (1324–1371), King of Scotland from 1330 to 1370. He was the son of Robert Bruce, and

in conflict with the English Army at Neville's Cross, in 1346, was defeated and made prisoner by Queen Philippa.

David, Sir (Tannatt William) Edgeworth, K.B.E., C.M.G., D.S.O., F.R.S. (1858–1934), an Australian geologist of the first rank, who was Professor of Geology at Sydney University 1891–1924. Spent much of his time in exploration, and accompanied as geologist Shackleton's Antarctic Expedition, 1907–9, leading the party that ascended Mt. Erebus, and discovering with Sir Douglas Mawson the South Magnetic Pole.

David, Jacques-Louis (1748–1825), a celebrated French painter of classic subjects, who put his art at the service of the New Republic.

David, St., patron saint of Wales, whose festival falls on March 1st, lived in the 6th century in Wales, and founded various monasteries.

Davidson, Randall Thomas Davidson, 1st and only Baron, P.C., G.C.V.O. (1848–1930), Archbishop of Canterbury, 1903–1928. Dean of Windsor, 1883–1891; Bishop of Rochester, 1891–1895, and Bishop of Winchester, 1895–1903. Was for a long period Domestic Chaplain and Clerk of the Closet to Queen Victoria, and married in 1878 the daughter of Archbishop Tait.

Davies, Rt. Hon. Clement, Q.C., M.P. (1884–1962), lawyer and politician. Called to the Bar, 1909, took silk, 1926. He led the Liberal Party from 1945 until 1956, and represented his native Montgomery from 1929 until his death.

Davies, Sir (Henry) Walford, K.C.V.O., O.B.E., Mus.D., D.Mus. (1869–1941), Master of the King's Music, 1934–41; Director of Music and Chairman of the National Council of Music, University of Wales, 1919–41, the Gresham Prof. of Music, 1924–41.

Davies, William Henry (1871–1940), was a Welsh poet who spent his early life as a tramp and odd-job man. For six years he wandered about America, where he lost a foot "train-jumping," and for eight years followed a similar life in England, tramping, peddling and stopping in common lodging-houses. His poems reveal an intimate knowledge of and love for Nature. An account of his life is given in his *Autobiography of a Super Tramp*.

Da Vinci. *See* **Leonardo.**

Davis, Jefferson (1808–1889), an American statesman, who on the breaking out of Civil War, was made President of the Confederate States. After the war he was a prisoner in the hands of the Federals, put on his trial for treason, and subjected to much indignity, but was ultimately discharged and wrote (1881) *The Rise and Fall of the Confederate Government*.

Davis, John (c. 1550–1605), one of the great Elizabethan explorers and discoverer of Davis's Strait, the channel between the Atlantic and Arctic Oceans on the west of Greenland. Invented the backstaff, or Davis's quadrant.

Davitt, Michael (1846–1906), after a hard-working and precarious bringing up this ardent Irish Nationalist attracted much notice by the bitter speeches he made on behalf of the Fenian Brotherhood, and in 1870 was sentenced to fifteen years' penal servitude for treason-felony, but was released on ticket of leave in 1877. Was one of the founders of the Irish Land League 1879. In 1881 was sent back to penal servitude, but released again in the following year. Was elected to Parliament while a prisoner at Portland but disqualified. Succeeded in entering Parliament in 1892, and resigned in 1899.

Davy, Sir Humphry, Bt., F.R.S. (1778–1829), the inventor of the safety-lamp. Was an eminent chemist whose researches and discoveries were of great scientific importance. Was the first to employ the electric current in chemical decomposition and discovered that nitrous oxide was perfectly respirable.

Dawber, Sir (Edward) Guy, R.A. (1861–1938), English architect. As Chairman of the Council for the Preservation of Rural England, he did much to bring about the restoration of buildings throughout the country.

Dawson, (George) Geoffrey (1874–1944), editor of *The Times*, 1912–19, and 1923–41; educated at Eton and Oxford; was private secretary to Lord Milner in S. Africa, 1901–5, editor of the *Johannesburg Star*, 1905–10.

Dawson, Peter (b. 1882), British singer, born in Adelaide, South Australia, and the possessor of a magnificent baritone voice.

Deakin, Rt. Hon. Arthur, C.H., C.B.E., J.P. (1890–1955), Trade Union leader; succeeded Ernest Bevin as general secretary of the Transport and General Workers' Union in 1949 and like him was a master negotiator.

Debussy, Claude Achille (1862–1918), French composer and founder of the Impressionist school in music, whose harmonies have a vague "atmospheric" effect. Among his works are *Suite bergamasque*, containing the popular *Clair de lune*, *L'après-midi d'un Faune*, inspired by the poem of Mallarmé, and *La Mer*. He also wrote an opera *Pelléas et Mélisande* based on Maeterlinck's drama and many piano compositions and songs.

Defoe, Daniel (1660–1731), the son of a London butcher. He became a political writer and novelist, obtaining world-wide fame by his *Robinson Crusoe*, written when he was nearly sixty, years of age. This was followed by several other novels, all of great merit.

De Forest, Lee (1873–1961), American inventor who was the first to use alternating-current transmission, improved the thermionic valve detector and amplifier, which revolutionised wireless and by which modern wireless and sound films (Talkies) were made possible. He designed the first high-power station for the United States Navy and was granted over three hundred patents.

De Gasperi, Alcide (1881–1954), Italian catholic politician. Founded the Christian Democrat Party and worked for European federation. Died on eve of breakdown of Brussels Conference on E.D.C. Prime Min. 1945–53.

De Gaulle, General. (*See* **Gaulle, Charles de.**)

De Havilland, Sir Geoffrey, O.M., C.B.E., F.R.Ae.A. (b. 1882), a pioneer of civil and military aviation. Began flying in 1908 and was the founder of the Stag Lane Aerodrome at Hendon and the designer of the famous Moth machines. Contributed in great measure to the advance of civil aviation since the first world war. Awarded the Guggenheim Medal in 1952. His son was killed in 1946 while testing a plane in preparation for breaking world speed record.

Delacroix, Ferdinand Victor Eugène (1798–1863), French painter of great imaginative and dramatic force, of the romantic school.

De la Mare, Walter John, O.M., C.H. (1873–1956), English poet and novelist whose work has a characteristic charm. Much of it was written for children.

Delane, John Thadeus (1817–1879), the famous editor of *The Times*, who, though he did not write himself, made his paper the greatest journal in the world. He occupied the editorial chair from 1841 to 1877.

Delaroche, Paul (Hippolyte) (1797–1856), an eminent French historical painter.

Delibes, Clément Philibert Léo (1836–91), French composer of much graceful music, including several operas, of which *Lakmé* is the most famous, and ballets, among them *Coppélia*.

Delius, Frederick, C.H. (1862–1934), English composer of German parentage. Studied at Leipzig from 1886 to 1888 where his suite *Florida* was first performed. In 1899 he went to live near Paris but became crippled and blind in his later years. Highly idiosyncratic in idiom, his music was more readily received in Germany than England until Sir Thomas Beecham's inspired performances won popularity for him in his native land. He composed operas, including *A Village Romeo and Juliet*, choral works, including *Sea Drift*, orchestral pieces, of which *On Hearing the First Cuckoo in Spring* is well known, besides chamber music, concertos, and songs.

Democritus (c. 460–357 B.C.), the Greek philosopher to whom the conception of the atomic theory is attributed. His cheerful disposition led to his being styled "the laughing philosopher," and the tradition tells that he put out his eyes in order not to be distracted in his speculations.

Demosthenes (385–322 B.C.), the famous Greek orator, statesman and warrior who, by his *Philippics*, roused the Athenians to resist the growing power of Philip of Macedon. Sixty-

one of his orations were preserved, and are regarded as the finest examples of their kind.

De Quincey, Thomas (1785–1859), an eminent essayist and critic, the friend of Coleridge, Wordsworth, and Southey. His *Confessions of an Opium-eater* is a British classic.

De Reszke, Jean (1853-1925) and **De Reszke, Edouard** (1856–1917), Polish operatic singers, the first a tenor, the second a baritone, who achieved fame and fortune by their singing.

Derwentwater, 3rd Earl of (1689–1716), the leader of the English Jacobite movement for placing the Pretender on the English throne. The rising took place in 1715, but was completely crushed by the Battle of Preston, and Derwentwater was beheaded.

Descartes, René (1596–1650), the famous French philosopher, mathematician, and author. Unconvinced by scholastic tradition and theological dogma, he sought to get back to primary truth, to the very definition of knowledge or the reason why anything can be said to be true. The basis of his Cartesian philosophy is summed up in his own words *cogito, ergo sum* (I am thinking so I exist).

Desmoulins, Lucie Simplice Camille Benoist (1760–1794), was one of the fiercest of the French Revolutionary leaders, and from the destruction of the Bastille to the early days of the Terror was unflagging in his onslaughts upon the aristocrats and the priesthood. He fell under the displeasure of Robespierre, however, and was sent to the guillotine along with Danton

De Valera, Eamon, LL D. (b. New York, 1882), Pres. Rep of Ireland, 1959– ; leader of the Fianna Fail Party; Prime Minister 1938–48, 1951–54, and 1957–59; Minister for External Affairs 1932–48 Pres of Executive Council of Irish Free State, 1932–38; Pres of Sinn Fein 1917–26 when Fianna Fail was founded. Delegate to Assembly and Council of League of Nations, 1932, and President thereof 1932 and 1938.

De Valois, Dame, Ninette, D B.E. (b. 1898), Irish-born ballet dancer and choreographer Between world wars had many triumphs as a dancer with the British National Opera company and with the Diaghilev Russian ballet. Director of the Royal Ballet School (formerly the Sadler's Wells School).

Dewar, Sir James, F.R S. (1842–1923), physicist and chemist, a native of Kincardine From 1875 until his death Jacksonian Prof. of Natural Philosophy at Cambridge and from 1877 Fullerian Prof of Chemistry at the Royal Institution. Famous for his work on the liquefaction of gases and his invention of the Thermos flask Invented, with Sir F. Abel, the explosive cordite

Dewey, Prof. John (1859–1952), the eminent American philosopher, psychologist and educationist, who, after holding professorships at the Universities of Minnesota, Michigan, and Chicago, where he was also Director of the School of Education until 1904, was Prof of Philosophy at Columbia University, New York, 1904–32 A follower of William James, he became well known in America as an adherent of pragmatism.

De Witt, Jan (1625–72), Dutch republican statesman, who carried on war with England and later negotiated the Triple Alliance, but was overthrown by the Orange Party and murdered.

Diaghilev, Sergei Pavlovich (1872–1929), Russian ballet impresario and founder of the Russian ballet, who selected the best dancers, musicians, and artists in his productions. Among those associated with him were Anna Pavlova, Vaslav Nijinsky, Tamara Karsavina, Leonide Massine, Michel Fokine, the choreographer, L. N. Bakst, the painter, and Igor Stravinsky, the composer.

Dick, Sir William Reid, K.C.V.O., R A , F R B S (1879–1961), British sculptor whose works include the Livingstone statue (Victoria Falls, Africa), memorial statue of King George V. at Westminster, and the statue of Pres. Roosevelt in Grosvenor Square.

Dickens, Charles (John Huffam) (1812–1870), the most popular novelist of the 19th century, who from very humble beginnings worked himself up to the highest position in the world of letters. His literary output was enormous. From the time of the publication of the *Pickwick Papers* down to his death in 1870, covering a period of 33 years, he produced novel after novel, all possessing the original Dickensian characteristics, yet each wonderfully different from the rest and his popularity continues undiminished. He did so much for the cultivation of the true sentiment of Christmas that, whenever that season comes round, his name is recalled with honour and homage. As a public reader of his own works Dickens evinced a marvellous dramatic gift. He was buried in Westminster Abbey.

Dickinson, Goldsworthy Lowes (1863–1932), English scholar, author and philosopher; an interpreter and upholder of the Greek view of life, which is the subject of many of his books.

Dicksee, Sir Francis Bernard, R.A. (1853–1928), well known as the painter of numerous pictures, including "Harmony," "Romeo and Juliet." and "The Funeral of a Viking"

Diderot, Denis (1713–1784), the famous French philosopher and editor of the *Dictionnaire Encyclopédique*, which occupied him thirty years.

Diefenbaker, Rt. Hon. John George, M.A., Q C. (b. 1895), Canadian lawyer and leader of the Canadian Progressive Conservative Party; Prime Min , 1957– .

Diemen, Anthony van (1593–1645), Dutch Admiral who was Governor-General of the East Indian Colonies, 1636–45. He extended Dutch influence and trade throughout the Far East, promoted explorations to Australia, 1636–42, and on one of such explorations, Abel Tasman discovered New Zealand and named the island which we now know as Tasmania, Van Diemen's Land.

Diesel, Rudolf (1858–1913), German engineer, inventor of an internal-combustion engine which he patented in 1893. The modern so-called Diesel engine represents the improvements achieved by many men and has evolved mainly from the invention of Herbert Akroyd-Stuart, patented in 1890.

Diocletian (Caius Aurelius Valerius Diocletianus) (245–313), Roman Emperor (284–305). Inaugurated the system of partnership emperors, whereby the Empire was divided into four sections (the famous tetrachy), administered by himself in the East, Maximian in Italy and Africa, Constantius in Britain, Gaul, etc , and Galerius in Illyricum. Ruthlessly persecuted the Christians.

Diogenes (412–322 B C), the celebrated Greek cynic philosopher who is said to have lived in a tub wearing the coarsest clothing and living on the plainest food. Many of his sayings have been preserved.

Dionysius. Two of the tyrants of Syracuse bore this name. The first was a great soldier and statesman as well as a poet and philosopher, and lived from *c.* 430–367 B.C. The second Dionysius was his son and successor, but was of such a cruel disposition that he was driven from the throne and died in obscurity in 343.

Disney, Walter Elias ("Walt") (b. 1901). American film cartoonist, creator of Mickey Mouse His *Silly Symphonies*, *Snow White and the Seven Dwarfs*, *Pinocchio*, and *Fantasia* brought him world-wide fame.

Disraeli, Benjamin. (*See* Beaconsfield).

D'Israeli, Isaac (1766–1848), father of Benjamin Disraeli, worked in a special literary field, and produced some interesting volumes dealing with authors and their writings. His best-known work is *Curiosities of Literature*

Dixon, Harold Bailey (1852–1930), Professor of Chemistry at Manchester University, 1887–1922, whose work on gaseous explosions opened a new era in combustion research.

Dobson, Frank, C.B E., A.R.A., A.R.B.S. (b. 1888), a leading English sculptor. President of the London Group, 1923–27.

Dobson, Henry Austin, LL D. (1840–1921), a Civil Servant from 1860 to 1901, he was the author of several volumes of Society verse and prose works, dealing chiefly with the 18th century.

Dodd, Francis, R.A., R.W.S. (1874–1949), painter, engraver and draughtsman. He was one of the official artists during the War of 1914–18, and executed a valuable series of portraits of British Admirals and Generals on active service. Appointed one of the official artists for the second world war, 1939–45.

Dodgson, Charles Lutwidge (1832–1898), a writer and mathematical lecturer at Christ Church, Oxford, who, under the pseudonym of Lewis

Carroll, achieved lasting fame by his *Alice's Adventures in Wonderland*, one of the most delightful books for children ever written.

Dolci, Carlo (1616–1686), the famous Florentine painter, examples of whose Madonnas and Saints are to be found in most National collections.

Dolci, Danilo (b. 1925), Italian architect who since 1952 has dedicated himself to the rehabilitation of the people of Sicily in their desperate poverty. He began with no resources but his own humanity, but now his work—agricultural, educational, and social—is inspiring world-wide interest. Pubs. *To Feed the Hungry, The Outlaws of Partinico.*

Dominic, St. (1170–1221), founder of the Order of Dominicans, or Black Friars, who devoted much energy to the conversion of the Albigenses, but meeting with small success, instituted a policy of persecution after the manner of the later Inquisition.

Domitian (Titus Flavius Domitianus) (A.D. 51–96), Roman Emperor, son of Vespasian, who after many cruel and tyrannical acts aroused the enmity of the people and was assassinated

Donatello (Donato di Niccolò di Betto Bardi) (1386–1466) the famous Italian sculptor, whose works are to be seen chiefly at Florence, though several examples are at South Kensington.

Donizetti, Gaetano (1797–1848), Italian operatic composer. Most popular of his sixty operas are *Lucrezia Borgia, Lucia di Lammermoor, La Fille du régiment, La Favorita,*and *Don Pasquale.*

Donne, John (1573–1631), an English poet and divine. As a preacher he was celebrated in his lifetime but few of his poems were printed and it was not until the 20th century that he was universally recognised as one of the most original of English poets. His writings include *Songs and Sonnets, Satyres, Elegies, Problems and Paradoxes*, and the *Holy Sonnets* He took orders in 1615 and was made dean of St Paul's in 1621. Sir Edmund Gosse's *Life and Letters* appeared in 1899 and Sir Herbert Grierson's monumental edition of Donne's poetry in 1912

Donoghue, Stephen ("Steve") (1884–1945), in his day a famous jockey. Rode the Derby Race winner six times, and established a new record by winning this classic event in three successive years, 1921–22–23.

Doré, Gustave (1833–1883), the well-known French artist, famous for his colossal scriptural paintings and his powerful illustrations to the works of Dante, Milton, and Tennyson

Dostoievsky Feodor Mikhailovitch (1821–1881), one of Russia's greatest novelists. Author of *Crime and Punishment Brothers Karamazov, The Idiot, The Possessed*, etc. Dostoievsky's novels are quite exceptional for their deep psychological insight, vision and marvellous tragic and analytic power, and have had a profound influence on modern European writers.

Douglas, Marshal of the R.A.F. Lord, G C B, M.C., D.F.C. (b. 1893), commanded Fighter Command, 1940–42, R A F. Middle East, 1943–44, and Coastal Command, 1944–45. C-in-C and Military Governor of British Zone of Germany, 1946–47. A Labour peer.

Douglas, Norman (1868–1952), novelist and writer of witty and elegant prose. A Scot, born in Austria, he made his home on the Mediterranean and was buried on Capri. Travel books include *Siren Land* (1910) *Fountains in the Sand* (1912), *Old Calabria* (1915), *Alone* (1921), *Together* (1923); his highly entertaining novel *South Wind* was published in 1917.

Doulton, Sir Henry (1820–1897), famous potter and the inventor of Doulton ware.

Dowden, Edward, M.A., LL D, D.C.L, Litt.D. (1843–1913). Well known for his critical and other writings, mainly dealing with the lives and works of the poets. Was Professor of Literature at Trinity College, Dublin, for 37 years

Dowding, Air Chief Marshal Lord, G.C.B., G.C.V.O., C.M.G. (b. 1882), Chief of Fighter Command in Battle of Britain, 1940.

Dowland, John (*c.* 1563–1626), English composer whose songs with lute accompaniment established him as the foremost lutanist of his day. His son Robert succeeded him as Court lutanist to Charles I.

Doyle, Sir Arthur Conan, M D. (1859–1930), masterly writer of detective stories, the creator of Sherlock Holmes, the archetype of detectives, who shared a flat in Baker Street with his friend and chronicler, Dr Watson, and conducted a long series of investigations. The immensely popular stories appeared in the *Strand Magazine* and include the *Hound of the Baskervilles* and the *Speckled Band.*

Doyle, Richard (1824–1883), an artist of much humour and fancy, who was exceedingly popular while on the staff of *Punch* from 1841 to 1850. The familiar cover of *Punch* is his work.

D'Oyly Carte, Richard (1844–1901), English theatrical manager, associated with the production of the Gilbert and Sullivan comic operas. The D'Oyly Carte Opera Companies played Gilbert and Sullivan all over the world.

Drake, Sir Francis (*c.* 1540–1596), the great admiral of Queen Elizabeth's time, who made many adventurous voyages, bent partly on discovery and partly on plunder. He was a leading figure—under Lord Howard—in the attack on and destruction of the Spanish Armada in 1588.

Draper, John William (1811–82), American chemist, b. near Liverpool, aided in the organisation of the medical school of New York university and became its professor of chemistry and physiology. He was the first to take a satisfactory photograph of the human face (1840)

Dreiser, Theodore (1871–1945), an American author whose novels of American life are written in vigorous native prose.

Dreyfus, Lt.-Col. Alfred (1859–1935), a French officer, condemned by a military secret tribunal on a charge of divulging secrets in 1894 to a foreign power, and condemned to imprisonment for life on Devil's Island in French Guiana At a sensational new trial in 1899 he was again found guilty, and sentenced to a mitigated term of incarceration for ten years, but strenuous efforts on his behalf secured a pardon later. In 1906 he was entirely exonerated and reinstated in the army, with the rank of Major, and made a Chevalier of the Legion of Honour.

Drinkwater, John (1882–1937), was a well-known dramatist and poet His plays *Abraham Lincoln* and *Oliver Cromwell* have had great praise and success

Driver, Samuel Rolles (1846–1914) a distinguished Hebrew and Old Testament Scholar who was Regius Prof of Hebrew at Oxford, 1883–1914. He was one of the greatest Hebrew scholars of his day, and was one of the higher critics of the Old Testament

Drummond, William (1585–1649), a Scottish poet —laird of Hawthornden—whose works dealt largely with political matters, but revealed considerable poetic power. Ben Jonson walked from London to Scotland to pay him his respects

Drury, (Edward) Alfred (Briscoe), R A (1857–1944) English sculptor who was responsible for many public monuments, including the colossal statues of Queen Victoria at Bradford and Portsmouth (1903), the decorations for the exterior of the War Office (1905) and of the Victoria and Albert Museum (1909)

Dryden, John (1631–1700), one of the most vigorous and prolific of English poets and writers, and a popular dramatist. He excelled in satire, and drew some powerful pictures of the statesmen of his day. His translation of Virgil ranks with Pope's translation of the *Iliad* He was buried in Westminster Abbey. Originally a Parliamentarian he went over to the Royalists and was laureate and historiographer-royal, 1670–88.

Du Barry, Marie Jeanne Bécu, Comtesse (1746–1793), the favourite of Louis XV., who exercised great influence over the King, but after his death, and the breaking out of the Revolution, took refuge in England for a time. Being tempted to return to Paris in 1793, she was arrested and guillotined.

Du Chaillu, Paul Belloni (1835–1903), a noted African traveller who was chief of General Gordon's staff in 1874, and wrote many valuable books of travels, his studies of the gorilla being especially interesting.

Dufferin and Ava, 1st Marquess of, P.C., K P, G.C.B., G.C.S.I., G.C.M.G., G.C.I.E., F.R.S. (1826–1902), was a diplomatist of great experience, a writer of brilliance, and filled many high offices with distinction and success, including those of Governor-General of Canada and Viceroy of India.

Duke-Elder, Sir William Stewart, K.C.V.O., M.A., D.Sc., M.D. (b. 1898), Scottish ophthalmic surgeon at several London Hospitals and Surgeon-Oculist to H.M. Queen Elizabeth.

Dulles, John Foster, (1888–1959), U.S. Secretary of State in the Republican Administration, 1953–59. In his foreign policy he encountered widespread criticism for his inflexible opposition to negotiation with Russia and U.S. recognition of China.

Dumas, Alexandre (1802–1870), French novelist and dramatist, who published more volumes than any man of his time. In the field of historical romance he showed wonderful power and resource and his thrilling story *Monte Cristo* is one of the great novels of the nineteenth century. He also wrote *The Three Musketeers*.

Dumas, Alexandre, Fils (1824–1895), French dramatist and novelist, son of the last-named, author of *La Dame aux Camélias*.

Du Maurier, George Louis Palmella Busson (1834–1896), one of the best known of the *Punch* artists during a long period and author of the novels of *Peter Ibbetson, Trilby,* and *The Martian*.

Dundee, John Graham of Claverhouse, 1st Viscount (1648–89), known as "Bonnie Dundee," royalist leader employed in the suppression of the Covenanters, taking part in the defeat at Drumclog and the victory of Bothwell Brig under the Duke of Monmouth in 1679. Defeated Mackay in the pass of Killiecrankie but was killed in the moment of victory.

Duns Scotus, Johannes (1266–1308), a famous scholastic who was born at Maxton, in the county of Roxburgh, joined the Franciscan Order at Dumfries in 1281, and ordained priest at Lincoln in 1291. Student and teacher at Oxford and Paris and died at Cologne. He was the great doctrinal opponent of Thomas Aquinas and has been surnamed *doctor subtilis*.

Dunstan, Saint (909–988), the famous Abbot of Glastonbury and Archbishop of Canterbury, who lived through seven reigns from Ethelstan to Ethelred and exercised great political influence.

Dupleix, Joseph François (1697–1763), was governor of the French East Indian possessions at the time when Clive was guiding the fortunes of the East India Company, and after Clive's victory at Plassey Dupleix's day was over. He returned to France, and fell into disgrace and poverty.

Dürer, Albrecht (1471–1528), the great German painter and engraver of Nuremberg, friend of Luther and Melancthon. Like his great Italian contemporary, Leonardo, he was not only a superb artist but a man of boundless intellectual curiosity and scientific insight, a true son of the Renaissance. His copper engravings include his three great masterpieces, *The Knight, Melancholia,* and *St Jerome in His Study*. Many of his engravings are in the British Museum. He may be regarded as the founder of the German school and the inventor of etching.

Durham, John George Lambton, Earl of (1792–1840), served as Governor-General of Canada after the disturbances of 1837, and in 1839 presented the famous *Durham Report* to Parliament. This laid down the principle of colonial self-government and marks a turning-point in the affairs of the Empire.

Duse, Elenora (1861–1924), an Italian tragedienne of world-wide reputation.

Duval, Claude (1643–1670), a notorious highwayman who, coming to England from Normandy in the Duchess of Richmond's service, took to "the road," and for a few years successfully evaded capture. He was hanged at Tyburn.

Duveen, 1st and only Baron, of Millbank (1869–1939), was head of a firm of noted art dealers, and a generous benefactor to British Art.

Dvorák, Antonin (1844–1904), Czech composer whose music is rich in the folk-song melodies of his native Bohemia and has a characteristic lilt and harmony. In 1884 he conducted his *Stabat Mater* in London, where this cantata and his *Slavonic Dances* were very popular. Composed his *From the New World* symphony in New York where he was head of the National Conservatoire (1892–94). He wrote 9 symphonies besides much orchestral and chamber work, piano pieces, songs, and operas.

Dyson, Sir Frank (Watson), K.B.E., F.R.S. (1868–1939), Astronomer Royal (1910–33). Was previously (1905–10) Astronomer Royal for Scotland. Was the author of a number of works on astronomy, and widely celebrated for his interesting public lectures.

Dyson, Sir George, K.C.V.O., M.A., Mus.D., LL.D., F.R.C.M. (b. 1883), Director of the Royal College of Music 1938–53. Author of *The New Music*, in which he analyses the technique of modern schools of composition. Composed a symphony, a violin concerto, and several choral works such as *The Canterbury Pilgrims* and *Nebuchadnezzar*.

E

Eastlake, Sir Charles Lock (1793–1865), English painter of historical and religious works. Pres. of R.A. 1850.

Eastman, George (1854–1932), American inventor who invented the roll photographic film and the famous Kodak camera. He amassed a vast fortune and his philanthropies were estimated at over £60 million. After a long illness he committed suicide.

Eck, Johann von (1486–1543), one of the most vigorous opponents of the Reformation in Germany.

Eddington, Sir Arthur Stanley, O.M., F.R.S. (1882–1944), Plumian Professor of Astronomy, Cambridge, 1913, Director of the Cambridge Observatory, 1914–44. Author of *The Nature of the Physical World* (1928) and many scientific works.

Eddy, Mrs. Mary Baker (1821–1910), founder of the religion (theology and practice) which she named Christian Science, and of the Church of Christ, Scientist. Author of the Christian Science textbook, *Science and Health with Key to the Scriptures*, published in 1875.

Ede, Rt. Hon. James Chuter, C.H., M.P. (b. 1882), Home Secretary in two Labour Governments, 1945–51. Parliamentary Secretary to the Ministry of Education, 1940–45.

Eden, (Robert) Anthony, 1st Earl of Avon, K.G., M.C., (b. 1897), succeeded Sir Winston Churchill as Prime Minister in April 1955. He had been Deputy Prime Minister and Foreign Secretary since 1951. First appointed Foreign Secretary in 1935 (the youngest to hold that office for over a century), but resigned in 1938 on a difference of policy with Mr. Neville Chamberlain about relations with Italy. Entered Parliament as a member for Leamington in 1923. He has many diplomatic achievements to his credit, though his Suez policy in 1956 divided the country. Resigned because of ill-health in Jan. 1957. Memoirs, *Full Circle*, pub. 1960. Earldom conferred 1961.

Edgar (943–75), King of England 959–75, who under the influence of Dunstan was able to carry out many useful reforms.

Edgar Atheling (c. 1060–c. 1130), as grandson of Edmund Ironside, was the lawful heir of Edward the Confessor, but in the confusion of the Norman invasion he was unable to maintain his claim.

Edgeworth, Maria (1767–1849), Irish novelist, whose stories included *Castle Rackrent, The Absentee,* and *Belinda*.

Edinburgh, H.R.H. Prince Philip, Duke of, K.G., P.C., K.T., G.B.E. (b. 1921), consort of H.M. Queen Elizabeth II. Relinquished his title of Prince Philip of Greece and of Denmark on his naturalisation in 1947, taking the name of Mountbatten. He is the great-great-grandson of Queen Victoria, grandson of Admiral Prince Louis of Battenberg, and nephew of Earl Mountbatten of Burma. Educated in England and Germany and at the Royal Naval College. Served in the Royal Navy throughout the war. Pres. of the National Playing Fields Association; Pres. of the British Association, 1951–52. Chancellor of Edinburgh University, 1953.

Edison, Thomas Alva (1847–1931), an American inventor, who after an adventurous boyhood became a telegraph operator and interested in electrical problems. Established himself in New York in 1869, and invented an improved printing telegraph. In 1867 set up an elaborate laboratory and factory at Menlo Park, New Jersey, from which place he sent out many clever and some startling inventions, including a system of duplex telegraphy, afterwards im-

proved into quadruplex and sextuplex transmission, the phonograph, and a method of preparing carbon filaments for the electric lamp; patented over 1300 inventions.

Edmund II. **(Ironside)** (980–1016), the son of Ethelred, after years of contention with the Danes, made a compact with Canute to divide England between them, but dying shortly afterwards the kingdom was settled on Canute.

Edward the Confessor (*c.* 1004–1066), the Anglo-Saxon king who immediately preceded—save for the brief reign of Harold of less than a year—the Norman Conquest, and founded Westminster Abbey, where a smaller church, then dilapidated, had previously for a period had a precarious existence. He was a religious-minded mystic, and was canonised in 1161, and given the shrine in the Abbey of his origination, which yet remains fairly intact, despite the ravages of time and disturbing hands.

Edward the Elder was the son of Alfred, and succeeded him as King of the West Saxons in 899. He was successful in overcoming the Danes, and became overlord of the Northern counties.

Edward the Martyr (963–979) became king in succession to Edgar, but, although supported by Dunstan, was not able to prevail against his stepmother Elfrida, who had him murdered.

Edward I. (1239–1307) was king of England from 1272 to 1307. Took part in the Crusades, completed the conquest of Wales, overcame Scottish opposition—executing Wallace and receiving the submission of Bruce, and promulgated many wise laws. He was nicknamed "Longshanks."

Edward II. (1284–1327), the son of Edward I succeeded his father when the latter died at Burgh-over-Sands in 1307 Suffered defeat at the hands of the Scots at Bannockburn, and on account of his arbitrary disposition, cruelty and lavish concessions to favourites, was deposed in 1327, and afterwards murdered at Berkeley Castle.

Edward III. (1312–1377) was one of the ablest of English monarchs who, although much taken up with long and bitter wars with France and Scotland, did much for the commercial interests of the nation, and was the means of introducing large numbers of Flemings into the country, who laid the foundation of the English textile manufacturers. He married Philippa of Hainault, and was the father of Edward the Black Prince.

Edward IV. (1442–1483) attempted unsuccessfully to regain the lost English possessions in France, and resorted to many despotic expedients for obtaining supplies but it stands to his credit that he entered into trading treaties with the commercial merchants of the Continent which were of benefit to his people.

Edward V. (1470–1483)—son of Edward IV. and Elizabeth Woodville—was the unfortunate king who was put to death in the Tower of London, and succeeded by Richard III, his unscrupulous uncle, who had made himself "Protector" and assumed the Crown a little more than two months after the death of Edward IV., publishing the demise of the young King and his brother the Duke of York as having occurred in prison. The bones of the murdered boys were many years afterwards taken to Westminster Abbey for final burial.

Edward VI. (1537–1553), succeeded his father, Henry VIII., when in his tenth year and died in his sixteenth year. The Reformation under the Regency of Somerset first, and then of Northumberland, made considerable progress during his brief reign. He was induced during his last illness to name Lady Jane Grey his successor, with results disastrous to that unfortunate personage and many others concerned.

Edward VII. (1841–1910). Was married to Princess Alexandra of Denmark in 1863. Visited India in 1875, and from that time onward was constantly in the public eye, taking part in all kinds of functions. Succeeded to the throne on the death of Queen Victoria, Jan. 22, 1901. The Coronation, which had been planned for June 26, 1902, had to be postponed in consequence of the King's sudden illness, but eventually took place on August 9 in the same year. His Majesty was a powerful factor in the preservation of the peace of Europe, his friendly intercourse with the heads of the French, German, and other nations earning for him the title of "Edward the Peacemaker."

Edward VIII. (b. 1894), succeeded to the throne on the death of his father, George V., Jan. 20, 1936; Prince of Wales 1911–36. Abdicated in favour of his brother H.R.H. the Duke of York Dec. 10, 1936, and was created Duke of Windsor. Governor of the Bahamas 1940–45.

Edwin (585–633), King of Northumbria, killed in battle at Hatfield Chase, Yorkshire, in 633. He was baptised into the Christian faith at York in 627, and built a church there. He was canonised later.

Egbert was a descendant of Cerdic, king of the West Saxons, and reigned from 802 to 839 in Wessex, in his later years became the first king of all England. In 835 he had to drive the Northmen away from Cornwall.

Ehrlich, Paul (1854–1914), a noted German scientist who was Director of the Royal Institute for Experimental Therapeutics at Frankfurt-on-Main, which he made famous by his experimental laboratory work in connection with cancer. His prolonged experimental researches brought him world-wide renown, his greatest triumphs being the discovery of salvarsan and neo-salvarsan. He received the Nobel Prize in 1908

Eiffel, Alexandre Gustave (1832–1923), French engineer, one of the first to employ compressed-air caissons in bridge building. Among his notable works are the great Eiffel Tower, Paris (1887–89) and the Panama Canal Locks

Einstein, Albert (1879–1955), one of the greatest men of science of all time, whose chief claim to fame rests upon his theories of relativity. He was born in Ulm of Jewish parents and lived for many years in Switzerland Awarded the Nobel Prize in 1922 for his work in quantum theory In 1933 he was driven by the Nazis to seek asylum in America and became a professor at the Institute for Advanced Study at Princeton, 1933–45. His works include *Relativity* (1920), *Zur Einheitlichen Feldtheorie* (1929), *About Zionism* (1930), *The Evolution of Physics* (1938), *The Meaning of Relativity* (1950), *Out of My Later Years* (1950)

Eisenhower, Gen. Dwight David, G C B., O.M. (b. 1890), Republican President of the United States, 1953–60 Supreme Commander Atlantic Forces in Europe 1950–52. U S. Chief of Staff, 1945–48 C-in-C. Allied Forces, European theatre of operations, 1943–45, and of Allied Forces, N Africa, 1942–43 Pres of Columbia Univ, 1948–50.

Eisenstein, Sergei Mikhailovich (1898–1948), Russian film director, whose silent film classic *The Battleship Potemkin* brought him world-wide fame. He also produced *Alexander Nevsky* and *Ivan the Terrible*

Eleanor, Queen of Edward I. (d 1290), was a woman of great piety and devotion. After her death the king had memorial crosses erected at the twelve places where her body rested on its way from Grantham to Westminster.

Elgar, Sir Edward, Bart., O.M., G C.V.O. (1857–1934), English composer and Master of the King's Musick, 1924–34. Starting as a violinist and a teacher, he composed many choral-orchestral works for various festivals and sprang to fame with the *Enigma Variations,* musical portraits of his friends Other compositions include two symphonies, the oratorios *The Kingdom, The Apostles* and *The Dream of Gerontius* and the tone-poem *Falstaff*.

Elgin, Thomas Bruce, 7th Earl of, P.C (1766–1841), a British diplomatist who brought to England from Athens the famous "Elgin marbles," now in the British Museum.

Eliot, George (1819–1880), the pen name of Marian Evans, who produced some of the most memorable novels of the 19th century, including *Adam Bede, The Mill on the Floss, Silas Marner, Middlemarch* and *Daniel Deronda.*

Eliot, Thomas Stearns, O.M. (b. 1888), one of the foremost lyric poets of the 20th century. Born in U.S.A. he became a naturalised British citizen in 1927. The poet of disillusionment, as he has been called, he made his name with his poem *The Waste Land* (1922), which was followed by *Poems* (1909–33), and by *Ash-Wednesday* (1930). Author of *Murder in the Cathedral,* portraying the murder of Thomas à

Becket, *The Cocktail arty*, and *The Confidential Clerk*. Awarded Nobel Prize for Literature 1948.

Elizabeth (b. 1900), Queen Consort of George VI, daughter of the 14th Earl of Strathmore. Before her marriage in 1923 she was Lady Elizabeth Angela Marguerite Bowes-Lyon. Chancellor, Univ. of London.

Elizabeth I. (1533–1603) came to the throne in 1558 at the age of twenty-five, and reigned forty-five years Was a fervid Protestant, a sincere lover of her country, a masterful and enlightened ruler—fickle as far as her favourites were concerned—and added distinction to a distinguished period. The defeat of the Spanish Armada, the execution of Mary Stuart, the naval supremacy of England, the extension of her colonies, and the glory of a great new literature of which Shakespeare was the brightest ornament are features associated with her reign.

Elizabeth II. (Elizabeth Alexandra Mary of Windsor) (b. 1926), ascended the throne in February 1952 at the age of twenty-five on the death of her father George VI Her Consort, Prince Philip, Duke of Edinburgh, is the son of Prince Andrew of Greece and a descendant of the Danish royal family. They have three children, Charles, Prince of Wales (b. 1948), Princess Anne (b 1950) and Prince Andrew (b. 1960)

Ellis, (Henry) Havelock (1859–1939), literary and scientific writer and an authority on sex.

Elwes, Gervase Henry (1866–1921), a famous English tenor who excelled in his interpretation of the works of Vaughan Williams and Elgar

Evans, Sir Arthur John (1851–1941), distinguished archæologist, chiefly famed for his excavations at Knossos in Crete and his discovery of the pre-Phœnician script.

Evans, Dame Edith Mary, D.B.E. (b. 1888), the versatile and brilliant English actress who made her first appearance as Cressida in *Troilus and Cressida* in 1912 She has played many leading roles and has also appeared in films.

Evatt, Rt. Hon. Herbert Vere, M A., LL.D (b. 1894), Australian lawyer and politician; Min for External Affairs 1941–49; leader of the Federal Labour opposition, 1951–60; Chief Justice, New South Wales, 1960–2

Evelyn, John (1620–1706), was one of the founders of the Royal Society and wrote several scientific works, but is best remembered for his *Diary* which covers the period 1640–1706.

Eyck, Hubert van (*c*. 1366–1426), and **Eyck, Jan van** (*c* 1386–1440), two of the greatest masters of the early Flemish School of Painters.

F

Fabius Maximus (Cunctator) (d. 203 B C.), the Roman Consul and Dictator, saved Rome from conquest by Hannibal by deliberate and well-planned strategic evasion of battle. The term "Fabian Policy" is derived from Fabian's tactics.

Fabre, Jean Henri Casimir (1823–1915), French naturalist whose lifelong interest was the study of the habits of insects and whose observations were delightfully recorded in his *Souvenirs entomologiques*, a work of many volumes.

Faed, Thomas, R.A. (1826–1900), one of the most successful of Victorian painters, won a great reputation for his Scottish subjects.

Fahrenheit, Gabriel Daniel (1686–1736), German physicist, born in Danzig, improved construction of thermometers, notably in using quicksilver for alcohol. Devised the scale with freezing-point at 32° boiling-point at 212°.

Fairbairn, Sir William, 1st Bt., F.R.S. (1789–1874), mechanical engineer and inventor. By the first utilisation of iron in shipbuilding, became eminent and wealthy.

Fairfax, Thomas, 3rd Lord (1612–1671), a promi-

nent leader of the Parliamentary army during the Civil War, who greatly distinguished himself at Marston Moor and Naseby.

Falla, Manuel de (1876–1946), Spanish composer whose music is highly individual with a strong folk-song element. His compositions are relatively few and comprise 2 operas, 2 ballets (*The Three-Cornered Hat* was one of Diaghilev's greatest successes), piano music, pieces for piano and orchestra, songs, harpsichord concerto, and guitar solo in memory of his friend Debussy.

Faraday, Michael, F.R.S. (1791–1867), great experimental physicist, founder of the science of electro-magnetism. He was the son of a blacksmith and at the age of 12 worked for a bookbinder, to whom he was later apprenticed. Became laboratory assistant to Sir Humphry Davy at the Royal Institution in 1813, and in 1827 succeeded him, becoming professor of chemistry in 1833. He was one of the world's most brilliant experimenters and set himself the problem of finding the connections between the forces of light, heat, electricity, and magnetism. The epoch-making discoveries he made form the basis of the modern electrical industry. He lectured superbly well and inaugurated the Christmas lectures for juvenile audiences at the Royal Institution.

Farman, Henri (1874–1958), French aviator, one of the pioneers of aviation and a famous designer and builder of aeroplanes.

Farouk I (b. 1920), King of Egypt, 1936–52. Forced to abdicate as a result of a military *coup d'état* in July 1952.

Farrar, Very Rev. Frederic William, D D., F.R S. (1831–1903), Dean of Canterbury, 1895–1903; a divine and author, some of whose writings attained a large circulation and exercised a considerable influence. His most popular publications were *The Life of Christ*, *The Life and Works of St. Paul*, and *Early Days of Christianity* Author of the schoolboy story *Eric*.

Faulkner, William (1897–1962), American novelist, recognised as one of the great writers of the century, whose series of novels *The Sound and the Fury*, *As I Lay Dying*, *Light in August*, *Sanctuary* (which brought a Nobel Prize) give a vivid picture of the American South Other novels include *The Hamlet*, and *The Reivers*

Fauré, Gabriel Urbain (1845–1924), French composer and teacher; pupil of Saint-Saëns He was much revered by his pupils at the Paris Conservatoire, among whom was Ravel. His works include chamber music, nocturnes and barcarolles for piano, an opera *Pénélope*, some exquisite songs, and *Requiem*

Fawcett, Rt. Hon. Henry (1833–84), blind Liberal statesman and economist. Prof. of Political Economy at Cambridge Author of *Manual of Political Economy* (1863).

Fawcett, Dame Millicent Garrett, G B E (1847–1929), widow of the above: educational reformer and leader of the movement for women's suffrage; a very able writer on political economy and one of the founders of Newnham College, Cambridge.

Fawkes, Guy (1570–1606), a Yorkshire Catholic, who with Catesby and other conspirators planned the Gunpowder Plot. Although warned of the discovery of the plot, Fawkes persisted and was captured in the cellar of the Parliament House and hanged. (*See* **Gunpowder Plot**, General Information section)

Fénelon, François de Salignac de la Mothe (1651–1715), Archbishop of Cambrai and a writer of distinction. His *Telemachus* is a French classic.

Ferdinand V. of Aragon (1452–1516), who married Isabella of Castile, and with her reigned over Spain during a period of great events. He saw the Moors expelled from Spain, equipped Columbus for the discoveries which led to Spain's vast colonial possessions, and instituted the Inquisition.

Ferguson, James, F.R.S. (1710–1776), a Banffshire man of great ability and inventiveness, who, from being a shepherd-boy, educated himself in astronomy, mathematics, and portrait painting, so that he was able to support his parents, and became eminent as a scientific lecturer. He was made a Fellow of the Royal Society.

Fermi, Enrico (1901–54), Italian nuclear physicist whose research contributed to the harnessing of atomic energy and the development of the atomic bomb. Prof. of Physics at Rome, Columbia Univ., New York, and Univ. of Chicago. He postulated the existence of the neutrino and discovered the element Neptunium Awarded the 1938 Nobel Prize in Physics.

Festing, Field Marshal Sir Francis Wogan, G.C.B., K.B E., D.S.O. (b. 1902), Chief of Imperial General Staff, 1958–61. During the war he commanded the 36th Division in Burma; known to his troops as the " front line general."

Feuchtwanger, Dr. Lion (1884–1958), German-Jewish author famous for his historical novels, such as *Jew Süss* and *'Tis Folly to be Wise*.

ffoulkes, Sir Arthur Frederick Brownlow, M.A. (b. 1900), British solicitor and educationist who became Chairman of the B.B.C. in 1957

Fichte, Johann Gottlieb (1762–1814); was Professor of Philosophy, first at Jena and then at Erlangen, and later Rector of the University of Berlin. His works had great influence upon the thought of his time and prepared the way for the later Hegelian dialectic.

Field, John (1782–1837), composer and pianist, born in Dublin: pupil of Clementi and teacher of Glinka At early age travelled Europe as virtuoso pianist. Composed seven concertos, three sonatas, and numerous piano pieces. Chopin's nocturnes were modelled on those of Field. The later part of his life was spent in Moscow, where he died.

Fielding, Henry (1707–1754), a celebrated English novelist, author of *Tom Jones*, *Joseph Andrews*, and *Amelia*, as well as many plays.

Fields, Gracie, C.B E. (b. 1898), an inimitable Lancashire comedienne, and a great popular favourite with the British public. Made her first London appearance in 1915 Equally successful on the films as on the stage, she gained the affections of her music hall audiences through her abundant vitality, her Lancashire humour and her remarkably flexible voice.

Fildes, Sir Luke, K.C.V.O., R A. (1844–1927), first attracted notice as a black-and-white artist, and illustrated Dickens' *Edwin Drood*. Exhibited at the Royal Academy in 1872, and at successive exhibitions was represented by many important works.

Finsen, Prof. Niels Ryberg (1860–1904), a Danish physician whose light-ray treatment of *lupus vulgaris* won the approval of Queen Alexandra and the aid of many philanthropists. He established in Copenhagen an institute for light therapy. Inventor of the Finsen ultra-violet lamp. Awarded 1903 Nobel Prize for Medicine.

Firdousi, *nom de plume* of **Abdul Kasim Mansur** (c. 930–1020), Persian poet whose great epic *Shahnama*, or *Book of Kings*, relates the history of Persia in 60,000 verses

Fisher of Lambeth, Baron (Most Rev Geoffrey Francis) P C , G C.V O , M A , Hon. D D. (b. 1887) Archbishop of Canterbury, 1945–61, the 99th holder of the office, Bishop of London, 1939–45, Bishop of Chester, 1932–39, Headmaster Repton School, 1914–32

Fisher, Rt. Hon. Herbert Albert Laurens, O.M., F R S (1865–1940), English historian and educational reformer; author of *A History of Europe*.

Fisher, Professor Sir Ronald Aylmer, Sc D , F.R.S. (1890–1962), one of the greatest of British scientists who revolutionised both genetics and the philosophy of experimentation by founding the modern corpus of mathematical statistics.

FitzGerald, Edward (1809–1883), English poet who gained world-wide fame by his translation of the *Rubaiyát* of Omar Khayyam (1859).

Fitzroy, Vice-Admiral Robert, F.R.S. (1805–1865). Attained celebrity as a meteorologist, and in 1854 was made superintendent of the Meteorological Department, and was the introducer of the system of storm warnings which were the beginning of weather forecasts.

Flammarion, Camille (1842–1925), French astronomer, famous for his observations on double stars, star-drift and popular lectures and books on astronomy. Founded the Astronomical Society of France in 1887. His best-known work is *L'Astronomie Populaire*.

Flamsteed, John, F.R.S. (1646–1719), was the first English Astronomer Royal, and a close friend of Sir Isaac Newton, whom he aided in many of his experiments.

Flaubert, Gustave (1821–80), one of the greatest of French novelists and creator of *Madame Bovary* which took six years to write. His extraordinary perfection of style was attained only through incessant labour. He hated anything lax and was only satisfied when he had exactly expressed his meaning. Other works were *Salammbo*, *La Tentation de Saint-Antoine* and his drama *Le Candidat*.

Flaxman, John R.A., (1755–1826), a great English sculptor who was born at York, and at 20 was employed as modeller by Josiah Wedgwood In 1787 he went to Rome, where he stayed 7 years. In 1800 he was elected R.A. and in 1810 became professor of sculptor to the Royal Academy.

Flecker, James Elroy (1884–1915), English poet who early showed signs of becoming one of the most notable poets of his generation, and lived to see his works recognised by the best critics of his time. His works include *Golden Journey to Samarkand*, *Hassan* (staged in London, 1923) and *Don Juan*, as well as many lyrics.

Fleming, Sir Alexander, F.R S (1881–1955), as a bacteriologist he made many original contributions, including the discovery of the antibacterial enzyme lysozyme in 1922 and penicillin in 1928. Full recognition of his discovery came only during the war, when Sir Howard Florey separated the drug now used for treatment from the original penicillin Awarded Nobel Prize for Medicine jointly with Sir H Florey and Dr. E. B Chain, 1945. Retired as director of the Wright-Fleming Institute of Microbiology at St. Mary's Hospital, London, in 1954

Fleming, Sir (John) Ambrose, F R S (1849–1945), was the inventor of the thermionic valve which revolutionised wireless telegraphy and also made wireless telephony possible Prof of Electrical Engineering in University College, London, 1885–1926

Fletcher, John (1579–1625), the famous collaborator with Beaumont in numerous plays which were popular in their day and take high position in the dramatic literature of the country.

Fleure, Prof. Herbert John, D Sc., F R S (b 1877), British geographer and anthropologist who was Prof. of Geography at Manchester University 1930–44, and Prof of Geography and Anthropology, University College of Wales, 1904–30

Flinders, Matthew (1774–1814), an explorer and navigator, who made important discoveries in and around Australia. He sailed through Bass Strait, so called in honour of his surgeon

Foch, Marshal Ferdinand, O M. (1851–1929), Generalissimo commanding the Allied Forces in France from March 1917 until after the Armistice was signed, Nov 11, 1918 Under his direction the great German offensive was checked and turned at the Marne in July 1918 He followed up this success with a series of rapid attacks culminating in the German surrender, Nov 11, 1918, when he imposed the conditions of the Armistice.

Fokine, Michel (1880–1944), was the famous Russian dancer and Master of the original Russian Ballet, to whom the modern renascence of ballet may be largely attributed A dominating figure in the world of ballet who became choreographer to Diaghilev's company

Fokker, Anton Hermann Gerard (1890–1939), Dutch (naturalised American) airman and aeronautical engineer, designer and builder of the well-known Fokker triplanes and biplanes employed by the German army

Fonteyn, Dame Margot (Mme. Roberto de Arias), D B E. (b. 1919), Prima ballerina of the Royal Ballet (formerly Sadler's Wells Ballet) and acclaimed foremost English dancer of to-day.

Forbes, (Joan) Rosita, F.R.G S. (b 1893), the well-known traveller and authoress. She has travelled and explored in Abyssinia, and crossed the Libyan desert in native costume in 1920.

Ford, Henry (1863–1947), founder of Ford Motor Co., 1903, of which he was President until 1919, when he was succeeded by his son, Edsel B. Ford (1893–1943). Henry Ford became the world's leading industrialist and its second richest man. Was the pioneer of the cheap motor-car, of which, since 1920, more than a million have been produced annually.

Forester, Cecil Scott (b. 1899), British author. His many novels include the *Captain Hornblower* series.

Forster, Edward Morgan, C H., LL.D., C.L. (b. 1879), English novelist whose novels *A Room with a View*, *Howards End*, *A Passage to India*, have given him great authority in the world of literature.

Foscari, Francesco (*c.* 1372–1457), Doge of Venice from 1423 to 1457. A great historical character, who governed Venice with a firm hand and increased her renown.

Fosdick, Rev. Harry Emerson (b. 1878), American Baptist preacher. Professor of Theology, Union Theological Seminary, New York, and Pastor, Riverside, formerly Park Avenue, Baptist Church, New York, 1926–46.

Fourier, François Charles Marie (1772–1837), the famous French socialist, who propounded a system of associated enterprise for giving everyone ample means on a system of communal industry. He made some attempts to carry out his Utopian ideas, but they did not succeed. He is best known by his *Traité de l'Association Domestique Agricole*.

Fowler, Sir John, Bart., K.C.M.G. (1817–1898), an eminent civil engineer, son of a Sheffield land surveyor With Sir Benjamin Baker he was the engineer of the Forth Bridge and of the Metropolitan Railway.

Fox, Rt. Hon. Charles James (1749–1806) was the second son of the first Lord Holland. Entered Parliament at nineteen, and became a Lord of the Admiralty in 1770. His opposition to the Royal Marriage Bill drew down upon him the displeasure of George III. Through the whole of Pitt's Premiership he was that statesman's most formidable opponent. He favoured American Independence; opposed the war with France; was one of the impeachers of Warren Hastings, denounced the Slave Trade and advocated Parliamentary Reform. After the death of Pitt in 1806 he was made Foreign Secretary, but died a few months later, and was buried in Westminster Abbey.

Fox, George (1624–1691), was the founder of the Society of Friends.

Foxe, John (1516–1587), the English martyrologist, whose *Acts and Monuments* (*Book of Martyrs*) is one of the best-known books in the language. Born at Boston in Lincolnshire, he became a clergyman of the Anglican Church and died in London

Frampton, Sir George James, R A, F S A (1860–1928). English sculptor. Well known are his Peter Pan statue in Kensington Gardens, and the Edith Cavell Memorial in St. Martin's Place, London.

France, Anatole (Jacques Thibault) (1844–1924), one of France's notable writers of fiction, showing a great mastery of character portrayal and satire Most of his works are translated into English

Francis I. (1494–1547), King of France (1515–47). Recovered Milan from Swiss at Marignano (1515). Tried to gain support of Henry VIII (Field of the Cloth of Gold, 1520) Contested supremacy in Europe of Hapsburg emperor, Charles V; defeated and captured at Pavia (1525). French renaissance flourished during his reign

Francis of Assisi, St. (1182–1226), founded the Franciscan Order of Monks and devoted himself to a holy life. He is a saint of the Roman Church, having been canonised by Pope Gregory IX, and is commemorated on October 4th.

Francis, Sir Philip, K.B. (1740–1818), an English statesman, the reputed author of the famous *Letters of Junius*.

Franck, César Auguste (1822–90), composer and organist, born at Liége in Belgium. From 1872 until his death was professor of organ at the Paris Conservatoire. His music is romantic, mystical, and personal in idiom. Much of his finest composition is for the organ, and his *Symphonic Variations for Piano and Orchestra*, *Sonata for Violin* and the *Symphony in D* rank him, with his younger contemporary Debussy, among the greatest of 19th-century musicians.

Franco, General Francisco (b. 1892), Spanish soldier and Dictator who served with the Spanish Forces in the Moroccan campaign of 1920–23 and was later Head of the Military Academy at Saragossa. Chief of the General

Staff 1935-36. Was Commander-in-Chief of the Nationalist Forces during the Spanish Civil War, 1936-39. President of Spain since Aug. 1939.

Franklin, Benjamin, F.R.S. (1706-1790), the famous American statesman and philosopher, who after serving an apprenticeship as a printer attracted public attention by publishing his *Poor Richard's Almanac*. He then began a series of scientific experiments, inventing among other things the lightning conductor. He was for ten years a member of the General Assembly; then lived in Britain as agent for his State for eighteen years; returning to America he took part in framing the Constitution of the United States.

Franklin, Rear-Admiral Sir John, F.R.S. (1786-1847), the famous Arctic explorer, whose final expedition in command of the *Erebus* and *Terror* ended disastrously, all the members of the expedition perishing. Many attempts were made to discover Franklin, but without obtaining anything save very fragmentary knowledge concerning his fate. He was born at Spilsby.

Franks, Rt. Hon. Sir Oliver Shewell, G.C.M.G., K.C.B., C.B.E., M.A. (b. 1905), British Ambassador to U.S.A. 1948-52; Provost of Worcester College, Oxford, 1962

Fraser of the North Cape, Admiral of the Fleet, Lord, G.C.B., K.B.E. (b. 1888), commanded Home Fleet, Eastern Fleet, and British Pacific Fleet successively, 1943-46. First Sea Lord, 1948-51.

Fraser of Lonsdale, Ian, Baron, C.H., C.B.E. (b 1897). Chair St. Dunstan's since 1921; Pres. British Legion, 1947-58, B.B.C. Gov., 1937-39 and 1941-46 Life peerage conferred, 1958.

Frazer, Sir James George, O.M., LL.D., F.R.S. (1854-1941), was an eminent British anthropologist; author of *The Golden Bough* and numerous other works on his subject.

Frederick I. (*c.* 1123-90), Holy Roman emperor from 1152. Nicknamed Barbarossa. A commanding personality, he won for the empire prestige unknown since Otto the Great. Though failing to subjugate his Italian territories, for his armies suffered from the Italian climate, he dominated his German subjects, expelled the semi-independent Duke of Saxony, Henry the Lion, from his duchy, encouraged the German cities, and was a national hero. Though not an ascetic, he was remarkable for an impeccable private life, distinguished himself on the second Crusade, and was drowned in Asia Minor on his way to the third.

Frederick II. (1194-1250), Holy Roman Emperor, an enlightened ruler whose court in Sicily was a centre of culture and learning, attracting Jewish, Mohammedan, and Christian scholars. Forced by illness to return from crusade in 1227, he was excommunicated by Pope Gregory IX.; still excommunicated, he again set sail for Palestine and by skilful diplomacy gained possession of Jerusalem, Bethlehem, and Nazareth. Frederick was a philosopher and man of science and delighted in exploding superstition. He founded the university of Naples, was a patron of the medical school at Salerno, wrote a treatise on falconry, and gave Sicily a code of laws.

Frederick II. or Frederick the Great (1712-86), King of Prussia (1740-86). By his masterful government and military successes he raised Prussia to the rank of a great power. He was a scholarly potentate, composed music and played the flute.

French, Field-Marshal Sir John. (*See* **Ypres, 1st Earl of.**)

Freud, Sigmund, M.D. (1856-1939), was Professor of Neurology, Vienna University, 1902-38. An eminent psychoanalyst; author of many books on his subject. Left Austria after the *Anschluss* to take up permanent residence in England. An account of Freudian theory will be found in **Section F, Part III.**

Freyberg, 1st Baron, Lieut.-Gen. Bernard Cyril, V.C., G.C.M.G., K.C.B., K.B.E., D.S.O. (b. 1889), Gov.-Gen. of New Zealand, 1946-52. Served with distinction in both world wars. Commanded Allied troops on Crete, 1941. Won third bar to D.S.O. in Italy, 1945.

Friese-Greene, William (1855-1921), inventor of the cinematograph. His pioneer work in commercial photography brought him no profit, and for many years he lived in poverty.

Frobisher, Sir Martin (1535-1594), was the earliest of British navigators to attempt to find the North-West passage from the Atlantic to the Pacific through the Arctic seas, and his name is commemorated in Frobisher's Strait, to the south of Baffin Land. For his services in connection with the defeat of the Spanish Armada he was knighted.

Froebel, Friedrich Wilhelm August (1782-1852), was the founder of the Kindergarten system of education, the object of which is "to give children employment in harmony with their nature, to strengthen their bodies, to exercise their senses and lead them up to the original ground of all life, to the idea of unity with themselves."

Froissart, Jean (1337-1410), a celebrated French writer who visited England and Scotland, and was the author of the famous *Chronicles*, which tell us so much of the achievements of the barons of old.

Frost, Robert (1874-1963), best loved of American poets. "Stopping by Woods on a Snowy Evening"; "Birches"; "The Death of the Hired Man"; "After Apple-Picking". Awarded Pulitzer Prize for poetry in 1924, 1931, 1937, and 1943.

Froude, James Anthony (1818-1894), the celebrated historian and biographer of Carlyle.

Fry, Elizabeth (1780-1845), a Norwich lady who devoted much of her life to the promotion of prison reform, and achieved considerable reputation as a preacher. She belonged to the Society of Friends.

Fry, Christopher (b. 1907), English poet and dramatist of Quaker family. Author of *The Lady's Not for Burning*, *Venus Observed*, and *The Darkness is Light Enough*.

Fry, Roger (1866-1934), English art critic and painter Introduced the work of Cézanne and the post-impressionists into England His most important book is *Vision and Design* Biography by Virginia Woolf (1940).

Fuchs, Sir Vivian Ernest, M.A., Ph.D. (b 1908), British geologist and explorer. Dir. of the Falkland Islands Dependencies Scientific Bureau since 1951; leader of the British Commonwealth Trans-Antarctic Expedition 1957-58, the first to cross the Antarctic continent.

Fuller, Thomas (1608-1661), the author of *Worthies of England* and a *Church History of Britain*, two well-known and valuable works.

Fulton, Robert (1765-1815), an inventive American engineer who distinguished himself by experiments in the application of steam to navigation, and finally in 1807, launched the *Clermont* on the Hudson.

Furniss, Harry (1854-1925), British caricaturist, was born in Wexford and came to London as a young man. He was a famous cartoonist and served on the staff of *Punch* from 1878-94. Illustrated the works of Dickens and Thackeray.

Furtwängler, Wilhelm (1886-1954), famous German conductor, and popular in Great Britain for his visits with the Berlin Philharmonic Orchestra, of which he succeeded Herr Nikisch as conductor.

G

Gade, Niels Vilhelm (1817-90), Danish composer. While studying at Leipzig he met Mendelssohn, whom he succeeded as conductor of the Gewandhaus orchestra. He wrote eight symphonies, chamber music, and choral works. Though characteristically Scandinavian, his work shows the influence of German romanticism.

Gagarin, Yuri Alexeyevich (b. 1934), Soviet airman who stirred the imagination of the world on 12 April 1961 by being the first man to be launched into space and brought safely back. His flight was made in the front portion of a Soviet multi-stage rocket which made a single circuit of the earth, the whole adventure taking 108 minutes.

Gainsborough, Thomas, R.A. (1727-1788), English landscape and portrait painter, whose works are remarkable for their grace and refinement. His *Duchess of Devonshire* was stolen when exhibited in 1876 and recovered in America some years later.

Gaiseric or Genseric (*c.* 390-477), king of the Vandals, the ablest of the barbarian invaders of the Roman empire. He led his people from Spain into Africa, took Carthage, gained control

of the Mediterranean by his pirate fleets, and sacked Rome in 455, thereby bringing about the fall of the western empire.

Gaitskell, Rt. Hon. Hugh Todd Naylor, C.B.E., M.P. (1906–63), statesman and economist; leader of the Labour Opposition, 1955–63; Min. of Fuel and Power, 1947–50; Min. of State for Econ Affairs, 1950; Chan. of the Exchequer, 1950–51; M.P. (Labour) for South Leeds, 1945–63. He was a commanding figure in the country and his untimely death was deeply lamented.

Gale, General Sir Richard, G.C.B., K.B.E., D.S.O., M.C. (b. 1896), Commander of 6th Airborne Div. which landed in Normandy in June 1944; C.-in-C. B.A.O.R., 1952–56; Dep. Supreme Allied Commander Europe (NATO), 1958– .

Galen, Claudius (A.D. 131–201), physician, b. Pergamum (Asia Minor) of Greek parents. He lived most of his life in Rome, established a large practice, and became court physician to Marcus Aurelius. He systematised medical knowledge in accordance with his idea of purposive creation by the will of God. This unscientific attitude, by discouraging original investigation, hampered medical progress for a thousand years. Many of his treatises still survive.

Galileo (1564–1642), great Italian scientist whose experimental-mathematical methods in the pursuit of scientific truth laid the foundations of modern science. He became professor of mathematics at Pisa university when he was 25 and lectured at Padua university for 18 years. He made a number of fundamental discoveries, *e.g.*, in regard to the hydrostatic balance, thermometer, magnet, telescope, and foreshadowed Newton's laws of motion. He detected the satellites of Jupiter, the ring of Saturn, and the spots of the sun. He proved the superiority of the Copernican over the Ptolemaic theory, and was imprisoned for so doing. He died the year Newton was born.

Galsworthy, John, O.M. (1867–1933), an English novelist and dramatist of force and originality who wrote a great series of novels dealing with the history of an upper middle class family. Awarded Nobel Prize for Literature in 1932.

Galton, Sir Francis, F.R.S. (1822–1911), founder of eugenics, cousin of Darwin. His early work, *Meteorographica* (1863), contains the basis of the modern weather chart. He is also remembered for his device of finger-print identification and for being one of the first to apply mathematics to biological problems.

Galvani, Luigi (1737–1798), Italian physician and physiologist, whose experiments at Bologna university demonstrated the principle of animal electricity.

Gama, Vasco da (*c.* 1460–1524), the adventurous Portuguese navigator who discovered the sea route to India in 1498 by doubling the Cape of Good Hope.

Gandhi, Mohandas Karamchand (1869–1948), great Indian patriot, social reformer, and moral teacher. Believed in the doctrine of non-violence. In the tense situation following the granting of independence to India, he strove to promote the co-operation of all Indians but was assassinated on his way to a prayer meeting.

Garbo, Greta (b. 1905), Swedish film actress. The most arresting and poetical actress on the screen of her day.

Garcia, Manuel de Popolo Vicente (1775–1832), Spanish tenor, composer, and singing master. His son **Manuel Patricio Rodriguez** (1805–1906) was tutor to many celebrities including Jenny Lind. Both his daughters (Mme Malibran and Mme Viardot) were celebrated operatic singers. His grandsons taught at the Royal Academy of Music and the Royal College of Music in London.

Gardiner, Samuel Rawson (1829–1902), an English historian, whose works deal mainly with the period from the accession of James I. to the end of the Commonwealth. Many of his books remain the standard authorities on their subjects.

Garibaldi, Giuseppe (1807–1882), the famous Italian soldier and patriot. In 1834 he was condemned to death for being concerned in a plot to seize a Government vessel, but escaped to South America, and for some years was engaged in various conflicts for liberty in that hotbed of revolution. Returning to Italy in 1848, he joined the Roman Republican movement, but was ultimately compelled to fly for his life, and emigrated to New York. In 1854 he returned to Italy, and on the outbreak of war in 1859 had a command given to him, and scored several victories against the Austrians. The next year found him at the head of a great volunteer army, intent upon liberating Italy. This tremendous task he successfully carried through, earning the admiration of the world for his generalship and patriotism.

Garrick, David (1717–1779), the leading tragic actor of his time and a highly successful manager. Was buried in Westminster Abbey.

Garrison, William Lloyd (1805–1879), an eminent anti-slavery leader of America.

Garvin, James Louis, C.H. (1868–1947), editor of the *Observer*, 1908–42, and of the *Encyclopaedia Britannica* (14th ed.), 1926–29.

Gaskell, Mrs. Elizabeth Cleghorn (1810–1865), an English novelist of acknowledged power, whose *Mary Barton, Ruth, Cranford,* and other stories dealing largely with Lancashire life achieved great popularity. Her *Life of Charlotte Brontë* was also a remarkable book.

Gaulle, Charles André Joseph Marie de (b. 1890), French general and statesman, chosen President of the Fifth Republic, Dec. 1958. On collapse of France in 1940 refused to surrender, but raised and led the Free French fighting forces, with headquarters in England. Took no part in parliamentary life from 1953 until June 1958, when a rebellion of colonists in Algeria brought him to supreme power. Since then France's main colonies in Africa have been given independence. His system of government, based on personal prestige and skill in manoeuvre, has carried his country through many crises, the most serious was the army revolt in Algeria in April 1961, which he met and mastered.

Gautier, Théophile (1811–1872) was an eminent French critic and novelist who at one time filled the position of secretary to Balzac. His romance, *Mademoiselle de Maupin,* caused a great sensation. He was also a poet.

Gay, John (1685–1732), the English poet who penned *The Beggar's Opera* and the well-known collection of poetic fables. He was a writer of great wit and fancy, and much patronised by Society.

Gay-Lussac, Joseph Louis (1778–1850), a French chemist, whose experiments with gases were of much scientific importance.

Ged, William (1690–1749), was one of the inventors of the process of stereotyping. He was a goldsmith and a native of Edinburgh.

Geikie, Sir Archibald, O.M., K.C.B., F.R.S. (1835–1924), noted geologist; President of the Royal Society 1908–13.

Geikie, Prof. James, F.R.S. (1839–1915), brother of the foregoing, and his successor in the Chair of Geology at Edinburgh University in 1882. His work on *The Great Ice Age* is a notable one.

Geoffrey of Anjou, Duke of Brittany (1113–51), founder of the Angevin dynasty of England, was son-in-law of Henry I. and father of Henry II., the first Angevin or Plantagenet king.

Geoffrey of Monmouth (1100–1154), was the author of the famous Old English chronicle which bears his name. He was born at Monmouth, and became Bishop of St. Asaph in 1152. His *Chronicon* is a compilation from older authors, and is notable for having contained the stories of King Arthur, King Lear, and Cymbeline.

George I. (1660–1727) was King of Great Britain from 1714 to his death, ascending the throne as direct descendant of James I. His reign saw many memorable events, including the Jacobite Rebellion, the South Sea Bubble, and the beginning of Walpole's great ministry.

George II. (1683–1760), son of the last-named, was King of Great Britain from 1727 to 1760. His reign covered a prosperous period in spite of wars and rebellions, and saw the Empire extended in India and North America, though he himself was a man of limited powers.

George III. (1738–1820), was the grandson of George II., and reigned from 1760 to 1820. He was a popular monarch for the most part, possessing all the domestic virtues and of simple tastes. The war with America lasted from 1775 to 1782, when the American States gained their independence, and from 1793 to 1815 the war with France was kept up with but little interruption. On the other hand, the

Empire in India was strengthened and enlarged, and the power of Great Britain on land and sea was splendidly shown.

George IV. (1762–1830) reigned from 1820 to his death, but filled the position of Prince Regent for some years previously. The King's personal character, in spite of the fact that he was called "The First Gentleman in Europe," showed such a want of dignity, and such an abandonment to licentiousness and frivolity, that he became very unpopular with the people.

George V. (1865–1936), was the second son of Edward VII. and Queen Alexandra. Entered the Navy as a cadet in 1877 and became second in the line of succession to the throne on the death of the Duke of Clarence in 1892. Married to Princess Mary of Teck in 1893. Succeeded to the throne May 6th, 1910, and celebrated his Silver Jubilee in 1935. Maintained the royal tradition of strenuous public engagements combined with unfailing attention to business of State.

George VI. (1895–1952), (Albert Frederick Arthur George of Windsor), second son of George V., was called to the throne in December 1936 on the abdication of his elder brother, Edward VIII. His reign was marked by the ordeal of war, by world revolution and social change and at the same time by a remarkable degree of constitutional harmony which his fine example and personal qualities did much to achieve

George, Henry (1839–1897), American political economist whose "single tax" on land values as a means of solving economic problems is expounded in his *Progress and Poverty*, pub. 1879.

George, Saint, the tutelary saint of England, adopted by Edward III. He is believed to have been a native of Cappadocia and a vigorous champion of Christianity in the days of Diocletian, and to have suffered martyrdom at Nicomedia 303 A.D. The dragon which he is said to have slain symbolises the powers of evil over which he triumphed.

German, Sir Edward (1862–1936), English composer, best known for his incidental music and light opera *Merrie England*. (His name was originally Edward German Jones.)

Gershwin, George (1898–1937), American jazz pianist and song-writer, composer of the famous *Rhapsody in Blue* and other works including the negro "folk-opera" *Porgy and Bess*.

Gesner, Konrad von (1516–1565), a scholarly Swiss naturalist, and father of the science of zoology.

Ghiberti, Lorenzo (1378–1455), Florentine sculptor whose bronze doors, beautifying the baptistery in Florence, were described by Michaelangelo as fit for the gates of paradise.

Gibbon, Edward (1737–1794), celebrated historian of the *Decline and Fall of the Roman Empire*.

Gibbons, Grinling (1648–1720), the celebrated wood-carver and sculptor, was born at Rotterdam and was brought to the notice of Charles II. by Evelyn, the diarist. The choir stalls of St. Paul's and the carving in the Wren library at Trinity College, Cambridge, are his work.

Gibbons, Orlando (1583–1625), a noted English composer of Church music who was organist of the Chapel Royal.

Gibson, Charles Dana (1867–1944), the famous American black-and-white artist and book illustrator, creator of "the Gibson girl."

Gide, André Paul Guillaume (1869–1951) French man of letters, novelist, dramatist and poet. Awarded the Nobel Prize for Literature in 1947.

Gielgud, Sir (Arthur) John (b 1904), English actor, member of the Terry family. Began by walking on at the Old Vic, and, later, became a Shakespearian actor, making a marked success as Hamlet, Richard II., and Prospero.

Gigli, Beniamino (1890–1957), the great Italian operatic tenor of the Metropolitan Opera House New York. The possessor of a voice of great natural beauty and one of the finest exponents of the music of Puccini and Verdi.

Gilbert, Sir Alfred, M.V.O., R.A., (1854–1934), sculptor and designer of gold and silver objects. Among his best-known sculptures are *Perseus Arming*, *Icarus*, *Eros* in Piccadilly Circus, the Shaftesbury Memorial and the Duke of Clarence Memorial at Windsor.

Gilbert, Sir Humphrey (1539–1583), knighted by Queen Elizabeth for his bravery in Ireland, later made voyages of discovery, and added Newfoundland to the British possessions.

Gilbert, Sir John, R.A. (1817–1897), one of the most prolific artists of his time. His illustrations to Staunton's edition of Shakespeare are remarkable for their picturesqueness and dramatic power.

Gilbert, William (1543–1603), physician to Queen Elizabeth I., has been called the father of electric and magnetic science. Published his great book on the magnet in 1600.

Gilbert, Sir William Schwenck (1836–1911), English humorist and playwright, is best remembered for the "Bab Ballads" and for the famous Savoy series of operas in which he collaborated with Sir Arthur Sullivan. Among the operas are *H.M.S. Pinafore*, *Patience*, *Iolanthe*, *The Mikado*, *The Gondoliers*, and *The Yeomen of the Guard*. The Gilbertian humour of plot and paradox, the kindly satire and the delightful metres combine with Sullivan's music to make the operas unforgettable and ever popular.

Gill, Arthur Eric Rowton, A.R.A. (1882–1940), English sculptor and engraver. His first piece of sculpture, *Madonna and Child*, was produced in 1910 and in 1913 he received the commission to carve the Stations of the Cross for Westminster Cathedral. In 1922–23 he carved the relief, *Christ Driving the Money-changers from the Temple*, which is placed at the entrance of Leeds University as a War Memorial Executed the carvings on Broadcasting House, London; also worked as a designer for printing, the Gill Sans type and the George VI stamps were his designs.

Gillray, James (1757–1815), the eminent caricaturist of the time of George III., who produced upwards of a thousand political cartoons.

Giotto di Bondone (*c.* 1266–*c* 1337), great Florentine artist, the first to break away from byzantine tradition and paint in a naturalistic way Much of his work has perished but still surviving are the great frescoes in the churches of Assisi, Padua, and Florence. He designed the western front of the cathedral at Florence and the campanile, the lower part of which was completed from his designs before his death

Gissing, George Robert (1857–1903), English author whose novels deal with poverty and the sociological problems of his day. *New Grub Street*, *The Unclassed*, *Charles Dickens*, *A Critical Study*, *The Private Papers of Henry Ryecroft* are among his best-known works

Giulio Romano or Giulio Pippi (*c.* 1492–1546) was a pupil of Raphael, and himself a distinguished painter and architect.

Gladstone, Rt. Hon. William Ewart (1809–98), the great Liberal statesman of the latter part of the nineteenth century, popularly known as the Grand Old Man. Entered Parliament in 1832 as a Tory, held various offices under Peel, and joined the Aberdeen coalition in 1852. From that time he served several terms as Chancellor of the Exchequer and was Liberal Prime Minister, 1868–74, 1880–85, 1886, and 1892–94. His financial policy was able, accurate, lucidly exposed, and very successful. His first ministry was active, its legislative achievements including the Disestablishment of the Church of Ireland, the Education Act of 1870, the Ballot Act of 1872, and the Irish Land Act, but in 1873 they were aptly described by Gladstone's great rival, Disraeli, as "exhausted volcanoes." His second ministry, returned to power after the astonishing Midlothian campaign, witnessed the defeat by the Boers at Majuba, the bombardment of Alexandria, and the disaster of General Gordon at Khartoum. His last two ministries were marked by the adoption of the policy of Home Rule for Ireland, which he was unable to carry. Gladstone was a good classical scholar and an earnest high churchman, who in 1838 published the *State in its Relations with the Church*, a work of considerable interest.

Glazunov, Alexander Constantinovich (1865–1936), Russian composer, pupil of Rimsky-Korsakov. He was an accomplished and prolific composer, the first of his eight symphonies being composed when he was only 16.

Glendower, Owen (1359–1415), a famous Welsh chieftain who proved a formidable opponent to Henry IV., and gathered around him a great following of Welshmen, whom he led with much bravery, though finally defeated in 1405.

Glinka, Mikhail Ivanovich (1804–57), Russian composer whose music has a strong folk-song element. Notable among his works are his two operas, *A Life of the Tsar* and *Russlan and Ludmilla*, based on a poem by Pushkin He is recognised as the first of the Russian national school.

Gluck, Christoph Willibald (1714–87), German composer, a figure of great historical importance in the development of the opera. He was the son of a Bohemian forester and studied in Prague, Vienna, and Italy. His first operas were in the Italian tradition, but with *Orfeo ed Euridice* (1762), inspired by classical Greek drama, he began his reform of the opera. Then followed the great operas *Alceste*, *Armide*, and *Iphigénie en Tauride* (1779), which is considered his masterpiece.

Goddard, Lord, P.C, Q C (b 1877), Lord Chief Justice of England, 1946–58

Godfrey of Bouillon (c 1061–1100) was the leader of the First Crusade, and after the conquest of Jerusalem, exchanged the title of King for that of "Protector of the Holy Sepulchre." He liberated the Holy Land, and was buried on Mount Calvary

Godiva, Lady (1040–1080), was the pious and beautiful wife of Leofric, Earl of Chester and Lord of Coventry. Having appealed to her lord to remit certain impositions from the inhabitants, he promised to grant her request if she would ride naked through the town. This she did, having first passed the word to have blinds and shutters drawn at the appointed hour, and so obtained the people's ransom

Godwin, Earl of the West Saxons (990–1053), was one of the most influential noblemen of his time and gave his daughter in marriage to Edward the Confessor, against whom he was afterwards in rebellion Godwin's son, Harold, claimed the throne after Edward's death, but was killed at Hastings

Godwin, William (1756–1836), English Radical philosopher, author of *Political Justice* and a novel, *Caleb Williams*. Married Mary Wollstonecraft (1759–97), author of *A Vindication of the Rights of Women*, in which she pleaded for the equality of the sexes, particularly in education Their daughter, Mary Wollstonecraft Godwin (1797–1851), married the poet, Shelley, and was the author of *Frankenstein*

Goethe, Johann Wolfgang von (1749–1832), German poet of great gifts and versatility Born at Frankfurt on Maine of a cultivated and well-to-do family, he was able to integrate all the powers with which nature had endowed him in one harmonious personality Before he went to Weimar at the age of 25 he had written *Gotz von Berlichingen* and *Werthers Leiden* and many beautiful lyrics He settled at Weimar in 1775, received a Ministerial appointment and actively interested himself in the welfare of the state. *Faust*, the great dramatic poem which accompanied him from early manhood to the end, epitomises his whole life and was his crowning achievement. Not only was he a great poet, but scientist and philosopher besides

Gogol, Nikolai Vasilievich (1809–52), one of the greatest of Russian novelists whose stories of provincial life are in the same setting as his masterpiece, *Dead Souls* (1842), of which an English translation appeared in 1906. Was also a playwright, his most successful play being *The Government Inspector* (1836), a satire on provincial bureaucracy.

Goldsmith, Oliver (1728–1774), the celebrated author of *The Vicar of Wakefield*, *The Deserted Village*, and *She Stoops to Conquer*. The son of a poor Irish curate, he found his way to London in 1756, subsequently devoting himself entirely to literature, being befriended by Dr. Johnson and held in great esteem by Reynolds, Burke and other eminent men of the time He was buried in the churchyard of the Temple.

Goodyear, Charles (1800–1860), an American, discoverer of the art of vulcanising rubber, by which the utility of the material was greatly extended.

Goossens, Sir Eugène (1893–1962), English composer and conductor of Belgian parentage. He was associated with many famous orchestras, and his compositions include the operas *Judith* and *Don Juan de Mañara*. His brother Léon is a celebrated oboe virtuoso, both his sisters are gifted harpists, and his father and grandfather, who also bore the name Eugène, were conductors

Gordon, Adam Lindsay (1833–1870), an Australian poet who wrote many stirring ballads and poems, his *Bush Ballads and Galloping Rhymes* being a great success.

Gordon, Major-General Charles George, C.B. (1833–1885), a distinguished soldier, administrator, and earnest Christian, who had a most adventurous, useful, and self-sacrificing career. He saw active service in the Crimea, China, and India, and in 1873 was made Governor of the Equatorial provinces of Egypt. In 1877 he went out to the Sudan for the Egyptian Government, and in 1884 again proceeded thither on behalf of the English Government to deal once more with the difficulties which had arisen consequent on the Mahdi's Rebellion While defending Khartoum he was murdered by the Mahdi's forces on the palace staircase.

Gordon, Lord George (1751–1793), was tried for treason as the instigator of the Anti-Popery riots of 1780, but acquitted on the ground that he had no treasonable intention. Some years later he was committed to Newgate for libelling Marie Antoinette and died there of fever.

Gorky, Maxim (pseudonym of Alexey Maximovich Peshkov) (1868–1936), great Russian writer and playwright Worked in a variety of trades from the age of ten--shoemaker's apprentice, scullion on a Volga steamboat, birdwatcher, baker, fisherman, railway guard—during which time he learned to write His early years are described in *My Childhood* (1913) His first story was published in 1892 His works are noted for their vividly drawn characters and social realism Took active part in 1905 revolution and later worked with Lenin

Gosse, Sir Edmund, C B, LL D, Litt D. (1849–1928), a distinguished poet and critic who wrote lives of Gray, Congreve and Dr Donne, and his *History of 18th Century Literature* and *History of Modern English Literature* show great critical power and appreciation. Was librarian to the House of Lords 1904–14, and wrote a book on French literary men and a life of Sir Thomas Browne In 1907 he published *Father and Son*, being recollections of his father

Gould, Sir Francis Carruthers (1844–1925). Perhaps the cleverest political caricaturist of his day, and did also considerable journalistic work as assistant editor of the *Westminster Gazette*.

Gounod, Charles François (1818–93), French composer whose fame rests chiefly on his operas *Faust* and *Roméo et Juliette*, though his lyrical gifts are best shown in some of his earlier works, such as *Le Médecin malgré lui* and *Mireille*. He also wrote oratorios and church music.

Gower, John (1325–1408), an English poet of the time of Chaucer, who wrote many elegant ballads and devotional poems. His *Confessio Amantis* was his outstanding work.

Goya y Lucientes, Francisco José (1746–1828), a famous Spanish painter and etcher, and one of the greatest of Spanish artists, and renowned for his wonderful series of etchings and satirical drawings. There are four Goya paintings in the National Gallery. One of his fine portraits is that of the Duchess of Alva In addition to portraits and genre he painted frescoes in the Cathedral at Saragossa. As versatile as he was facile, he also occupies a high position among etchers.

Grace, Dr. William Gilbert (1848–1915), renowned and almost legendary cricketer who by his character and skill dominated English cricket for over forty years, and was probably the best-known man in England. Altogether in first-class cricket he scored 54,896 runs, including 126 centuries, and took 2876 wickets. Scored 1000 runs in May 1895; and three times made over 300 runs in an innings.

Graham, John, of Claverhouse, Viscount Dundee (1643–1689). Renowned for his sturdy adherence to the Stuarts, and headed a rebellion in Scotland against William and Mary, but was killed at the Battle of Killiecrankie.

Grahame, Kenneth (1859–1932), as a writer of books for children ranks almost with Lewis Carroll. *The Golden Age*, *Dream Days*, and *Wind in the Willows*, all achieved great popularity.

Grahame-White, Claude (1879–1959), aviator and engineer, the first Englishman to gain an

aviator's certificate, 1909; won the Gordon Bennett Cup with the then record speed of 60½ miles per hour in 1910, founded the first British Flying School and published many works on aircraft.

Grainger, Percy Aldridge (1882–1961), pianist and composer, b. in Australia, U.S.A. citizen. He was a brilliant player and an authority on folk-song, the influence of which is apparent in all his compositions.

Grant, General Ulysses Simpson (1822–1885), the most distinguished American general of the Civil War. President of the United States from 1869 to 1877.

Granville-Barker, Harley, D Litt., LL.D., F.R.S.L. (1877–1946), distinguished English dramatist, producer, and actor. Introduced plays of Ibsen and Shaw to British public. His own plays reflect influence of Shaw, and are particularly notable for their realistic dialogue.

Grattan, Henry (1746–1820), an Irish orator and statesman who, first in the Irish Parliament and afterwards in the Imperial Parliament, did memorable work for the cause of his country.

Gray, Thomas (1716–1771), the English poet, whose *Elegy written in a Country Churchyard* is one of the most beautiful in the language. His other poems were not numerous but included a fine *Ode on a Distant Prospect of Eton College* and a notable *Ode to Adversity*

Greeley, Horace (1811–1872), founder of the *New York Tribune* and a political writer of great power and influence. Was an unsuccessful candidate for the United States Presidency in 1872.

Green, John Richard (1837–1883), an eminent English historian. Published a *Short History of the English People* in 1874.

Greenway, Kate (1846–1901), a gifted book illustrator and water-colour artist, whose drawings of children won her great popularity and the warm approval of no less a critic than Ruskin.

Greene, Graham (b. 1904), important English novelist and journalist whose novels (*The Heart of the Matter, Brighton Rock, The Quiet American, Our Man in Havana, A Burnt-out Case*), like his plays (*The Complaisant Lover*), and films (*Fallen Idol, The Third Man*), deal with moral problems in a modern setting from a Catholic standpoint

Gregory, St. (257–336), was founder of the Armenian Church, and spent his last years in a cave at the foot of Mount Sebuh

Gregory the Great, St. (c. 540–604), Pope 590–604. The last great Latin Father and the forerunner of scholasticism. The real founder of the temporal power and the political influence of the papacy, he also maintained the spiritual claims of Rome, enforcing discipline, encouraging monasticism, defining doctrine, and adding to the music liturgy, and canons of the Church Thus he exerted enormous influence on the life and thought of the Middle Ages.

Gregory VII (c. 1020–85), Pope from 1073. Originally called Hildebrand. Battled for papal omnipotence within the Church, stamping on simony and the marriage of priests. His victory in the conflict of empire and papacy came when the emperor, Henry IV, did penance for three days in the snow at Canossa, but had the unfortunate result of leading to further internal dissensions in Germany and to papal absorption with power politics rather than to Gregory's aim of an ideal theocracy embracing all States.

Gregory XIII (1502–85), Pope, 1572–85; introduced the Gregorian calendar

Grenville, Sir Richard (1541–1591), the Elizabethan sea-captain, who with his one ship engaged a fleet of Spanish war-vessels off Flores, in 1591, was captured and shortly after died on the Spanish flagship *San Pablo*, an exploit celebrated in Tennyson's noble ballad, *The Revenge*.

Gresham, Sir Thomas (1519–1579), was the wealthiest London merchant and financier of his time. He built the first Royal Exchange and founded Gresham College. The son of Sir Richard Gresham (Lord Mayor of London), he succeeded his father as King's Agent at Antwerp, and proved an astute money-finder for the Court in four successive reigns, ending as Queen Elizabeth's " Royal Merchant."

Greuze, Jean Baptiste (1725–1805), French painter, whose works, especially his studies of girls, display much delicacy and beauty of handling.

Grey, Charles, 2nd Earl, K.G. (1764–1845), a great English Whig statesman under whose Premiership were passed the Reform Bill of 1832, the Bill abolishing slavery throughout the British Empire (1833), and the Poor Law Amendment Act, 1834.

Grey, Lady Jane (1537–1554), was the daughter of the Duke of Suffolk and great-granddaughter of Henry VII. On the death of Edward VI, she was proclaimed Queen, but only reigned for nine days, Queen Mary ousting her and maintaining the Tudor succession. Six months later Lady Jane and her husband, Lord Guildford Dudley, were executed.

Grey of Fallodon, 1st and only Viscount, K.G., P.C. (1862–1933). Under-Secretary for Foreign Affairs, 1892. Foreign Secy., 1905–16. He won high approval for his handling of the Balkan difficulties of 1912–13, and all through the difficult strain which preceded Germany's rush into war acquitted himself with force and dignity. Leader of Liberal Party in House of Lords until Aug. 1924. Chancellor of Oxford Univ., 1928–33.

Grieg, Edvard Hagerup (1843–1907), a Norwegian musical composer, who presented the characteristics of his country's music with strong accentuation in numerous compositions of great melodic beauty.

Griffin, His Eminence Cardinal Bernard William (1899–1956), Roman Catholic Archbishop of Westminster from 1944 until his death.

Griffith, Arthur (1872–1922), was the first President of the Irish Free State 1921; founder and first editor of *Sinn Fein* 1906–15, and founder of the *Sinn Fein* movement.

Griffith, David Wark (1880–1948), pioneer American film producer. Noted especially for his remarkable films *Broken Blossoms* and *The Birth of a Nation* Invented much of the technique of the modern cinema, such as the close-up, the flash-back, and the fade-out, and developed many famous stars, including Mary Pickford, L. Barrymore, and D. Fairbanks, Sr.

Grimm, the brothers **Jakob Ludwig Karl** (1785–1863) and **Wilhelm Karl** (1786–1859), German philologists and folk-lorists who wrote the world-famous *Fairy Tales*. They planned a gigantic etymological dictionary of the German language, which was completed by German scholars in 1961.

Grimthorpe, 1st Baron, LL D. (1816–1905), long known as Sir Edmund Beckett, Bt., K C., was a great authority on horology, and, with Professor Sir George Airy (*q.v.*), designed " Big Ben " He restored St. Albans Cathedral at his own cost.

Gromyko, Andrei A. (b. 1908), Russian diplomat; succeeded D. T. Shepilov as Foreign Minister, Feb 1957 Ambassador to Britain, 1952–3, and to the U S A., 1943–46. Representative of the Soviet Union on the U.N. Security Council, 1946–49.

Gronchi, Giovanni (b. 1888), succeeded Signor Einaudi as President of the Italian Republic in 1955 and is a member of the left-wing of the Christian Democrat Party.

Grossmith, George (1847–1912), the well-known actor and entertainer. His father, George Grossmith the elder, was also a popular entertainer and lecturer, his brother, Weedon Grossmith, was an actor and artist of considerable attainments, and his son, George Grossmith (1874–1935), was a successful comedian, and the first to introduce revue and also cabaret entertainment into England.

Grote, George (1794–1871), English historian famous for his *History of Greece*, 1846–56, an epoch-making and standard work.

Grotius, Huig van Groot (1583–1645), Dutch jurist, the founder of international law. He was condemned to life imprisonment for supporting religious toleration but made a daring escape and found refuge in Paris, where he wrote his masterpiece *De Jure Belli et Pacis.*

Grouchy, Marshal Emmanuel, Marquis de (1766–1847), a famous Napoleonic general who, at Hohenlinden, Wagram, and in the Moscow retreat rendered signal service. After Waterloo he led the defeated army back to Paris.

Grove, Sir George (1820–1900) was a distinguished engineer and bridge and lighthouse builder, but better known as an enthusiastic lover of music,

the study and performance of which in England he did much to promote. His *Dictionary of Music and Musicians* is a standard work.

Guedalla, Philip, M.A (1889–1944), was an English historian and essayist. Author of *The Partition of Europe* (1914), *The Second Empire* (1922), *Palmerston* (1926), *The Missing Muse* (1929), *The Duke* (1931), and other works.

Guido Reni (1575–1642), Italian painter of the Bolognese school whose works are characteristic of the Italian baroque art of his period and include the famous *Aurora* fresco in the Rospigliosi palace at Rome, and *Crucifixion of St. Peter* (Vatican).

Gustavus Adolphus, King of Sweden (1594–1632), the " Lion of the North," after a lengthy campaign in Poland, entered the Thirty Years' War in support of Swedish interests and Protestant distress, won the Battle of Breitenfeld in 1631, and was killed in action the next year.

Gutenberg, Johann (*c.* 1400–68), German printer, b. Mainz, the first European to print with movable types cast in moulds. The earliest book printed by Gutenberg was the Mazarin Bible (**L76**).

Guy, Thomas (1644–1724), founder of Guy's Hospital, was a dealer in Bibles, speculator and money-lender, who after making a large fortune, bequeathed £300,000 for the erection and endowment of the famous hospital.

Gwynne, Nell (1650–1687), English actress; as a girl, orange-seller near Drury Lane Theatre, favourite mistress of Charles II. Her eldest son was made Duke of St. Albans.

H

Haakon VII. (1872–1957), King of Norway. Formerly Prince Carl of Denmark, second son of Frederick VIII ; elected to the throne on the separation of Norway from Sweden in 1905 Married Princess Maud, youngest daughter of King Edward VII. in 1896.

Hadfield, Sir Robert Abbott, Bt., F R S (1858–1940), English metallurgist whose discovery of manganese steel in 1882 brought him recognition from every steel-producing country

Hadrian (76–138) was Emperor of Rome in succession to his uncle Trajan, and one of the greatest of Roman rulers. He visited Britain, and in A D. 121 built the wall between Newcastle and Carlisle for protection of his dominions against the Picts and Scots

Hafiz, pseudonym of Shams ad-Din Mohammed (1320–1389), great Persian lyrical poet. His principal work is the *Divan*, a collection of short sonnets called *ghazals* The sobriquet *Hafiz*, meaning one who remembers, is applied to any one who has learned the Koran by heart

Hahnemann, Samuel Christian Friedrich (1755–1843), the German physician who founded the system of homœopathy.

Haig, Field-Marshal, 1st Earl of Bemersyde, K T , G.C.B., O.M., G C V.O., K C.I.E. (1861–1928), C.-in-C. of the British Expeditionary Forces in France and Flanders, 1915–19.

Haile Selassie I., G C.B , G.C.M.G., G.C.V O. (b. 1891), Emperor of Ethiopia, April 1930 to May 1936, and since May 1941.

Hailsham, 2nd Viscount, Quintin McGarel Hogg, Q C. (b. 1907), Chair. Conservative Party, 1957–59, Min. for Science and Technology, 1959–.

Hakluyt, Richard (1553–1616), the first of English naval historians By his *Divers Voyages touching the Discovery of America*, and *Principal Navigations, Voyages, and Discoveries of the English Nation*, did much to help forward the colonising spirit.

Haldane, John Burdon Sanderson (b. 1892), British physiologist and geneticist, son of John Scott Haldane (1860–1936), whose researches led to improvements in public health and industrial safety. Formerly Weldon Prof. of Biometry at University College, London; emigrated to India, July 1957.

Haldane, Viscount, P.C., K T., O.M., F.R S. (1856–1928), sat for Haddingtonshire, 1885–1911. In 1901 was Vice-President of the Liberal Imperialist League, and at the close of 1905 was made War Minister and organised the Territorial Force. Lord Chancellor, 1912–15, and again in first Labour Government, 1924.

Halévy, Ludovic (1834–1903), a brilliant French writer who supplied Offenbach with libretti for some of his most famous comic operas; among them *La Belle Hélène*, *La Grande Duchesse*, and *Barbe Bleue*. In conjunction with Meilhac he wrote several notable plays of which *Frou-frou* was perhaps the most successful.

Halifax, Charles Montague, Earl of (1661–1715), seventeenth century financier who was responsible for the National Debt, the window tax, the revaluation of the currency, and the foundation of the Bank of England.

Halifax, 1st Earl of, Edward Frederick Lindley Wood, K G., P.C., O M , G C.S I., G.C.I.E., T.D. (1881–1959), filled many difficult positions with distinction and success and was especially notable as Viceroy of India, 1926–31, Foreign Secretary, 1938–40, and British Ambassador in Washington, 1940–45. He wrote a life of John Keble and was prominent in the life of the Church of England. Chancellor of Oxford University 1933–59.

Halifax, George Savile, Marquess of (1633–95), author of *Advice to a Daughter* and *Character of a Trimmer*, was a gifted and independent politician, pamphleteerist, and orator.

Hallam, Henry (1777–1859), a graceful and scholarly historian who contributed several important works. His *View of the State of Europe during the Middle Ages*, *Constitutional History of England*, and *Introduction to the Literature of Europe* are distinguished for their clearness of style and correctness of judgment.

Hallé, Sir Charles (1819-1895), a distinguished pianist and conductor who was born in Westphalia Went to Paris to study music in 1836, and in 1848 settled in London, where he soon became known as a piano-player of the first rank. He organised an orchestra of high-class talent, and for many years conducted it in London and the provinces. He married Madam Norman Neruda (d 1911), the celebrated violinist in 1888, and was knighted the same year.

Halley, Edmund, F.R S (1656–1742), English Astronomer Royal from 1720 to his death and ranked next to Newton among the scientific Englishmen of his time. Made first magnetic survey of the oceans from the naval vessel *Paramour*, 1698–1700. Discovered what is known as Halley's comet.

Hals, Franz (1584–1666), a famous painter of the Dutch School, who is represented in the leading galleries of Europe The Wallace Collection has his world-famous picture, the *Laughing Cavalier*.

Hamilton, Alexander (1757–1804), American statesman and economist, opponent of Thomas Jefferson, served as Secretary of the Treasury in Washington's cabinet, 1789–95. Though a monarchist by predilection, he urged the adoption of the Constitution, and in conjunction with Maddison and Jay wrote the *Federalist*.

Hamilton, Emma Lyon, Lady (1761–1815), was a woman of humble birth and great personal beauty who attained prominent notice by her association with Sir William Hamilton, British Ambassador at Naples, who married her, and afterwards with Lord Nelson, who conceived an infatuation for her.

Hammarskjold, Dag Hjalmar Agne Carl (1905–1961), Sec -Gen. of the United Nations, 1953–61. Killed in air crash on way to the Congo to end dispute between central government in Leopoldville and M. Tshombe of Katanga province. Posthumously awarded 1961 Nobel Peace Prize.

Hammond, John Lawrence Le Breton (1872–1949), English journalist and historian whose works on social and industrial history, written mainly in collaboration with his wife, Barbara Hammond, include *The Village Labourer*, 1911, *The Town Labourer*, 1917; *The Skilled Labourer*, 1919; *The Rise of Modern Industry*, 1925; and *The Age of the Chartists*, 1930.

Hampden, John (1594–1643), English patriot who opposed Charles I.'s " Ship Money " tax, and by his resistance and eloquent advocacy of the wish of the people helped the Parliamentary cause.

Hamsun, Knut, pen-name of **Knut Pedersen** (1859–1952), Norwegian author and farmer, who in his youth struggled for existence, visited America twice and earned his living by casual labour. His monumental work, *Markens Gróde* (*Growth of the Soil*), gained him the Nobel Prize in 1920.

Handel, George Frederick (1685–1759), German

composer, son of a barber-surgeon to the Duke of Saxony; born the same year as Bach. He spent much of his life in England composing operas and achieving world-wide fame by his magnificent series of oratorios. His operas, of which there are over forty, include *Atalanta*, *Berenice*, and *Serse*, and his oratorios, of which there are thirty-two, include *Saul*, *Israel in Egypt*, *Samson*, *Messiah*, *Judas Maccabaeus*, and *Jeptha*. He also composed chamber music, *concerti grossi*, music for chorus and orchestra, solo cantatas, harpsichord suites, and much other beautiful and noble music. Beethoven said of Handel, "Go and learn of him how to achieve great effects with simple means." Eight years before he died he became totally blind and relied upon his old friend and copyist John Christopher Smith to commit his music to paper. He was buried in Westminster Abbey.

Hannibal (247–183 B C), the renowned Carthaginian general, who led an army against Rome, and achieved many notable victories over superior numbers. Was defeated by Scipio at the Battle of Zama, and afterwards suffered exile, and poisoned himself

Harcourt, Rt. Hon. Sir William Vernon, F.R.S. (1827–1904), barrister, author, Liberal statesman, an enthusiastic supporter of Mr. Gladstone.

Hardicanute (1019–1042), son of Canute the Great, was King of England from 1040 to 1042, and imposed the tax called Danegeld. He was the last Danish sovereign of this country

Hardie, James Keir (1856–1915), a Socialist politician and Labour representative who acted as editor of the *Miner* and the *Labour Leader* from 1887 to 1904. He is regarded as the founder of the Labour Party. During his early life he worked in a Scottish coal pit, but in 1882 became a journalist, and entered Parliament as member for West Ham (South) in 1892–95, being the first Socialist to be elected to the House of Commons. First Chairman of the Parliamentary Labour Party, 1906–8, M.P. for Merthyr Tydvil from 1900 till his death.

Hardwicke, Sir Cedric Webster (b. 1893), English actor who made his debut in *The Monk and the Woman* in 1912. Has acted in many Shaw and Shakespearian plays, and is also a distinguished film actor.

Hardy, Thomas, O.M. (1840–1928), was educated as an architect and practised for some time, but became known as a promising novelist in 1871 with his story *Desperate Remedies* In 1874 his *Far from the Madding Crowd* was published, which at once made him a name. Following that, at short intervals, came a long series of powerful novels from his pen Perhaps the most notable of his stories are *The Trumpet Major*, *The Mayor of Casterbridge*, *Tess of the D'Urbervilles*, and *Jude the Obscure*. In 1908 he completed a dramatic poem entitled *The Dynasts*, whose central figure is Napoleon.

Hargreaves, James (1720–1778), was a poor Lancashire-born mechanic who invented the spinning jenny, one of the revolutionising labour-saving contrivances of the latter half of the 18th century. It met with much opposition, however, and kept him poor, though the community afterwards reaped the advantage in a greatly improved industry.

Harkness, Edward Stephen, B.A., M.A., LL.D (1874–1940) was a banker and one of America's greatest philanthropists. Donor of the Pilgrim's Prize of £2,000,000 to Great Britain, founded in 1930 the Pilgrim Trust in appreciation of Great Britain's acceptance of financial burdens in the Great War of 1914–18.

Harley, Robert, 1st Earl of Oxford, K G., P.C. (1661–1724), a distinguished Tory statesman—originally, however, a Whig—of the Queen Anne period, who fell into disgrace after that Sovereign's death in consequence of being suspected of intriguing with the Stuarts. He served at different times as Speaker of the House of Commons, Chancellor of the Exchequer, and Lord Treasurer. "The Harleian Collection" in the British Museum is a reminder of his cultured literary tastes.

Harold II. (1022–1066), the last of the Saxon Sovereigns of England, and the son of Earl Godwin, was crowned King in succession to Edward the Confessor in 1066. The coming of William the Conqueror, with his great army, soon, however, put an end to the hopes of Harold and his followers; and the Battle of Hastings terminated at once his life and Saxon sway in this country.

Haroun-Al-Raschid (763–809), the famous Caliph of Bagdad, familiar to all by the references to him in the *Arabian Nights*—a wise and powerful ruler.

Harriman, William Averell (b 1891), Ambassador at large for Pres. Kennedy, 1961—; former Ambassador to Russia and Britain; adviser to Pres. Truman on defence and foreign policy and special representative in Europe of U.S. Government in connection with Marshall Aid, 1948–52.

Harris, Joel Chandler (1848–1908), American journalist and author, famous as the creator of "Uncle Remus." The negro humour of his stories brought him world-wide popularity among adults and children alike. His Brer Rabbit in the Uncle Remus negro folk-tales was the forerunner of Mickey Mouse, impudently victorious in every contest against fearful adversaries.

Harrison, Frederic (1831–1923), as leader of the English Positivists, filled a prominent part in philosophical discussions during the last quarter of the 19th century. In 1907 he published *The Creed of a Layman* and *The Philosophy of Common Sense*, and in 1908 *Realities and Ideals*.

Harrison, John (1693–1776), the inventor of the chronometer, for which he received the Government grant of £20,000, was a mechanician of great ingenuity, who effected many important improvements in clocks, watches, and other instruments. In 1715 he made an 8-day clock with wooden wheels, which is still working in the Science Museum, South Kensington

Harte, Francis Bret (1839–1902), the American poet and author, who leapt into popularity in the late 'sixties by his clever sketches and stories of Californian mining life

Harty, Sir (Herbert) Hamilton, Mus. Doc. (1880–1941), was a well-known British composer and conductor. Conductor of Hallé Orchestra 1920–33. Musical Adviser and Conductor-in-Chief of London Symphony Orchestra 1932–41.

Harvey, William (1578–1657), an English doctor and scientist who rose to great eminence both as an anatomist and physiologist, and became Physician Extraordinary to James I. He immortalised himself by discovering the circulation of the blood in 1616.

Hastings, Sir Patrick, Q C (1880–1952), lawyer, politician, and playwright Attorney-General in first Labour Government, 1924. Author of *The Blind Goddess*.

Hastings, Warren (1732–1818), the first Governor-General of India. On his return to England 12 years later he was impeached on charges of excessive cruelty and corruption. The trial lasted seven years, and cost Hastings £76,000. He was ultimately acquitted, and the East India Company settled an annuity of £4,000 upon him, and he lived to see his plans for the security of British rule in the Orient publicly applauded.

Hauptmann, Gerhart (1862–1946), one of the leading dramatic poets of Europe. Born in Silesia, he devoted himself first to agriculture, then to art, and subsequently to the drama, and lived in Rome, Berlin, Switzerland, and the United States. Produced many plays, including *The Weavers*. Winner of the Nobel Prize for Literature, 1912

Havelock, Major-Gen. Sir Henry, K C B (1795–1857), one of the heroes of the Indian Mutiny, who led the troops to the relief of Cawnpore and Lucknow.

Hawke, Edward, 1st Baron, K.C.B. (1705–1781), one of the great admirals of the 18th century. He won a brilliant victory over the French fleet at Quiberon in 1759 in a tremendous storm.

Hawkins, Sir Anthony Hope (1863–1933), a popular novelist and playwright. Amongst his best-known works were *The Prisoner of Zenda*, *The Dolly Dialogues*, and *Rupert of Hentzau*.

Hawkins, Sir John (1532–1595), a brilliant naval officer of the Elizabethan period, who did much sea fighting in many climes, and served as vice-admiral in the expedition against the Spanish Armada, for which he was knighted.

Hawthorne, Nathaniel (1804–1864), one of the most distinguished novelists that America has pro-

duced. *The Scarlet Letter* and *The Blithedale Romance* are his greatest novels.

Haydn, Franz Joseph (1732–1809), Austrian composer, who belongs to the great classical period of Bach, Handel, and Mozart and whose style also influenced Beethoven. He has been given the title "father of the symphony." Much of his life was spent as musical director to the princely Hungarian house of Esterhazy. In 1791 and again in 1794 he visited London, where he conducted his Salomon symphonies. He composed many operatic works, string quartets, symphonies (104 in all), sonatas, songs, Masses, and chamber music. His two great oratorios, *The Creation* and *The Seasons*, were written in his old age.

Hazlitt, William (1778–1830), English essayist and critic. His *Characters of Shakespeare's Plays* and his published lectures on the poets and dramatists, besides his *Table Talks*, are still widely read. His son William (1811–1893) was also of literary tastes, though he became Senior Registrar in the Bankruptcy Court, and the son of the latter, William Carew Hazlitt (1834–1913), though originally a civil engineer, acquired celebrity as a bibliographer and numismatist.

Head, Antony, 1st Viscount, P.C., K.C.M.G., C.B.E., M.C. (b. 1904), first British High Comm. Nigerian Federation, 1960– . Sec. of State for War, 1951–56. Min. of Defence 1956–57.

Hearst, William Randolph (1863–1951), American newspaper proprietor who began by editing the *San Francisco Examiner* in 1887, and was until 1938 head of the largest newspaper firm in the world.

Hedin, Dr. Sven Anders, Hon. K.C.I.E. (1865–1952), a Swedish traveller who made discoveries in Central Asia, and wrote extensively thereon.

Hegel, Georg Wilhelm Friedrich (1770–1831), a famous German philosopher and professor who taught that truth or reality has three aspects revealing itself in dialectical development (Thesis, Antithesis, Synthesis) and identified reality with rationalism. He wrote many important works, among which are *The Phenomenology of the Spirit*, *The Science of Logic*, *Philosophy of Right*.

Heidenstam, Carl Gustaf Werner von (1859–1940), Swedish author and one of the most brilliant and outstanding figures in Swedish literature. Received Nobel Prize for Literature, 1916.

Heifetz, Jascha (b. 1901), Russian-born violinist who became a naturalised American. Studied with Auer in St. Petersburg. Was the first musician to win a reputation in England by gramophone records before his first personal appearance there.

Heine, Heinrich (c. 1797–1856), the German lyric poet, who lived for the best part of his life in Paris, and produced from time to time poems of profound beauty and subtlety of thought. Cynical, satirical, and often bitter, many of his writings excited great conflict of opinion, and showed intense emotional power.

Helmholtz, Hermann Ludwig Ferdinand von (1821–94), German physiologist, physicist, and mathematician who made many important contributions to the knowledge of thermodynamics, electrodynamics, and optics. His pupil Heinrich Hertz discovered electromagnetic radiation.

Helmont, Jan Baptista van (1577–1644), Belgian chemist who devoted himself to the study of gases. His chief work is *Ortus medicinae* (1648).

Héloïse (c. 1101–64), niece of Canon Fulbert of Notre Dame. Famed for her romantic attachment to Abelard. (*See* **Abelard.**)

Helpmann, Robert Murray (b. 1909), Australian-born actor, ballet dancer, and choreographer. Became premier danseur, Sadler's Wells Ballet, 1933, and has appeared in several films, including *Henry V* and *The Red Shoes*.

Hemingway, Ernest (1899–1961), American author of some celebrated novels: *A Farewell to Arms*, *Death in the Afternoon*, *For Whom the Bell Tolls*, *The Snows of Kilimanjaro*, *The Old Man of the Sea*. Nobel Prize 1954.

Henderson, Rt. Hon. Arthur (1863–1935), President of World Disarmament Conference, 1932–35; Leader of the Labour Party, 1931–32, Foreign Secretary, 1929–31; Home Secretary, 1924. Awarded the 1934 Nobel Peace Prize.

Henley, William Ernest (1849–1903), English poet and journalist, a close friend of R. L. Stevenson. Was Editor of the *Scots Observer* in 1889, and later the *National Observer*, in which he first published the *Barrack-Room Ballads* of Kipling, with whose work his own has much in common.

Henrietta Maria (1609–1669), the daughter of Henry IV of France and wife of Charles I.

Henry I. (1068–1135), youngest son of William the Conqueror, came to the throne in 1100 during the absence of his elder brother Robert on Crusade, and later had to fight and imprison the latter. He was an able administrator and a strong ruler to whom, with his grandson Henry II., we owe in a great measure the establishment of the Common Law system and many permanent administrative reforms.

Henry II. (1133–1189) was King of England from 1154 to 1189. He had serious conflicts with the Church, which were not rendered less acute by the assassination of Thomas à Becket. The story of *Fair Rosamond* is connected with this monarch.

Henry III. (1207–1272), King of England from 1216 to 1272. Was at war with his barons for the greater part of his reign, and incurred much unpopularity by his reckless living and patronage of foreign favourites.

Henry IV. (1367–1413), reigned from 1399 to 1413. The son of John o' Gaunt, he succeeded his father in the Duchy of Lancaster in 1399, and later captured and imprisoned Richard II., who was deposed by Parliament and the crown given to Bolingbroke as the grandson of Edward III. Henry IV. thus became the first of England's Lancastrian Kings.

Henry IV. of France (Henry of Navarre) (1553–1610), prior to becoming king was the leader of the French Huguenots, and although going over to the Catholics on being crowned, remained in sympathy with the Protestants and protected them by the famous Edict of Nantes. **Ravaillac,** a religious fanatic, assassinated Henry.

Henry V. (1387–1422), reigned from 1413 to 1422, and distinguished himself in the wars with France, the Battle of Agincourt being his greatest triumph. Is said to have been wild and dissolute in his youth, but made an able, energetic and undoubtedly courageous king.

Henry VI. (1421–1471), King of England from 1422 to 1461. Succeeding to the throne under a protectorship as a baby nine months old, he had a troubled reign, including a long war with France and loss of French possessions, the Jack Cade insurrection, and the beginning of the Wars of the Roses, which led to his deposition and the enthronement of Edward IV. by the triumphant Yorkists. Was imprisoned in the Tower, and there found dead one day in 1471. Founder of Eton and of King's College, Cambridge.

Henry VII. (1457–1509), the first of the Tudor line, reigned from 1485 to 1509, succeeding Richard III., after defeating and killing him on Bosworth Field. Was very avaricious, yet able, and accumulated vast treasure. He built the Gothic Lady Chapel of Westminster Abbey, and is there buried.

Henry VIII. (1491–1547), reigned from 1509 to 1547. A luxury-loving monarch of great diplomatic gifts, and unscrupulous to a degree when his own personal desires were concerned. His quarrels with the Church resulted in the acceptance of the Reformation. His half-dozen matrimonial exploits, his deposition of Wolsey and his suppression of the monasteries are familiar incidents of history. Less known is the foundation of the modern navy with the establishment of the Navy Office in 1546.

Henry "the Navigator" (1395–1460), a Portuguese Prince, son of John I. He discovered Madeira and the Azores, and was the chief instrument of the national impetus for navigation.

Henschel, Sir George, Mus.D. (1850–1934), English baritone singer, composer and conductor, born in Breslau, he became a naturalised Englishman in 1890. Founder and part conductor of London Symphony Concerts, 1886.

Hepplewhite, George (d. 1786). One of the four great English 18th-century cabinet-makers. He was a contemporary of Chippendale, Robert Adam and Sheraton. His name is identified with the style of furniture which followed the Chippendale period.

Heraclitus of Ephesus (c. 540–475 B.C.), a Greek philosopher, chiefly famous for his doctrine that

everything is in a state of flux. He regarded fire as the primordial element.

Herbert, George (1593–1633), the most purely devotional of English poets.

Hereward the Wake, the last of the Saxon nobles to hold out against the Normans. Taking refuge in the Fen country, he long defied the Conqueror's forces, but was at last betrayed into the enemy's hands by monks. William afterwards honoured him with a place at Court.

Herod the Great (*c.* 73–4 B.C.), the tyrannical king of Judæa who secured the title from Marc Antony in 37 B.C. This was the Herod who was ruling when Christ was born and who ordered the massacre of the Innocents.

Herodotus (*c.* 485–425 B.C.), the great Greek historian, called by Cicero the father of history Has also been called the father of anthropology.

Herrick, Robert (1591–1674), an English lyric poet, unrivalled in his own field. Author of *Gather ye Rose Buds*, *Cherry Ripe*, *Oberon's Feast*, etc.

Herriot, Edouard (1872–1957), French statesman; Pres. of the National Assembly, 1947–54. A much-travelled scholar, Mayor of Lyons for more than a generation, three times Prime Minister, and the recognised spokesman of the Left-Centre party, which was for so long dominant in French politics.

Herschel, Sir John Frederick William, Bt., F.R.S. (1792–1871), a celebrated astronomer who did much to extend the power of the telescope.

Herschel, Sir William, F.R.S. (1738–1822), great astronomer, father of the last-named, discovered the planet Uranus. His sister, Caroline Lucretia (1750–1848), was the author of *Index to Flamsteed's Observations of the Fixed Stars* and *Errata*.

Hertz, Heinrich (1857–1894), German physicist whose laboratory experiments confirmed Maxwell's electromagnetic theory of waves.

Herzl, Theodor (1860–1904), founded modern political Zionism.

Hesiod (*floruit c.* 735 B.C.), ancient Greek nature poet, author of the poems *Work and Days*, which tells of life in the country.

Hewart, 1st Viscount, P.C. (1870–1943), Lord Chief Justice of England, 1922–40.

Hill, Octavia (1838–1912), a noted pioneer English social reformer who took a practical interest in the housing conditions of the poor, and a pioneer in slum clearance in London. Helped to institute the Charity Organisation Society, and was one of the first women to sit on a Royal Commission.

Hill, Sir Rowland, K.C.B., F.R.S. (1795–1879), the first propounder of the idea of the penny postal system, and secretary to the Postmaster-General from 1846 to 1854, after which he was Chief Secretary to the Post Office until 1864.

Hindemith, Paul (b. 1895), German composer and violinist belonging to the anti-romantic or neo-classical school. Much of his work is *Gebrauchsmusik* (workaday music written with the aim of establishing closer contact between composer and public). His works are numerous and strikingly varied, and include sonatas and chamber works, songs, operas, ballet music, Symphony in E flat, and the oratorio *Das Unaufhörliche*. Formerly Prof. of Music Yale Univ.; Prof. of Musical Theory, Univ. of Zurich, 1952–.

Hindenburg, Field-Marshal Paul von (1847–1934). President of the German Reich, 1925–34; Chief of the General Staff, 1916–18.

Hinshelwood, Sir Cyril Norman, M.A., D.Sc., F.R.S. (b. 1897), Pres. of the Royal Society and Dr. Lee's Prof. of Chemistry, Univ. of Oxford, 1937–. Shared with Prof. Semenov of Russia the 1956 Nobel Prize for Chemistry for researches into the mechanism of chemical reactions.

Hinton, Sir Christopher, K.B.E., M.A., D.Eng., D.Sc.(Eng.), F.R.S. (b. 1901), as Man. Dir. of the Industrial Group of the U.K. Atomic Energy Authority played important part in the building of Calder Hall. Appointed in 1957 Chairman Central Electricity Generating Board which owns and operates Britain's nuclear power stations.

Hippocrates of Chios (fl. *c.* 430 B.C.), a Greek business man who specialised in mathematics and was the first to compile a work on the elements of geometry.

Hippocrates of Cos (*c.* 460–*c.* 370 B.C.), Greek physician, the father of medicine, b. on the island of Cos off the coast of Asia Minor. He established medical schools in Athens and elsewhere and separated medicine from superstition and so placed it on a scientific basis.

Hirohito, Emperor of Japan (b. 1901), acceded to the throne Dec. 1926.

Hitler, Adolf (1889–1945). Dictator of Germany, 1933–45. Born in Austria, son of Customs official. Worked in Vienna as artisan: already held anti-semitic and anti-marxist views. Came to Munich in 1912; enlisted in Bavarian Infantry at outbreak of first world war. At the end of the war conditions in Germany favoured the growth of a fascist movement and under his personal leadership the National Socialist (Nazi) Party climbed to power. Appointed Reich Chancellor, 1933. On death of Hindenburg in 1934 became Führer. Commander-in-Chief Wehrmacht, 1935. Under the Hitler regime working class movements were ruthlessly destroyed, all opponents—communists, socialists, Jews—were persecuted and murdered. By terrorism and propaganda the German state was welded into a powerful machine for aggression. There followed the occupation of the Rhineland in 1936, the annexation of Austria and Czechoslovakia in 1938 and 1939, the invasion of Poland and declaration of war by Great Britain and France in Sept. 1939, the invasion of Soviet Russia in 1941. Final defeat came in 1945 and on April 30 Hitler committed suicide in the Chancellery as the Russians closed in on Berlin.

Hobbes, Thomas (1588–1679), English philosopher who published his most famous work, *Leviathan*, in 1651. He favoured strong Government and therefore supported the supremacy of the State even in religion, but his arguments aroused great antagonism even among the Royalists. He was a child of his age in his enthusiasm for scientific enquiry, and his works provoked fresh thought on many sides.

Hobbs, Sir John Berry (" Jack ") (b. 1882), first played for Surrey 1905; retired from first-class cricket Feb. 1935 Scored 61,221 runs including 197 centuries.

Hobhouse, Leonard Trelawney (1864–1929), English sociologist, who, after a brilliant career at Oxford, joined the staff of the *Manchester Guardian* in 1897, and became in 1908 editor of the *Sociological Review*. His book *The Theory of Knowledge* established his reputation in 1896, and was sustained by *Mind and Evolution*, 1901, and *Morals in Evolution*, 1906 His greatest work was *Development and Purpose*, 1913.

Ho Chi-minh (b 1892), leader of the Vietnam revolutionary nationalist party of Indo-China. Successfully led the struggle for independence during and after the second world war. President of North Vietnam.

Hogarth, William (1697–1764), the celebrated engraver and painter who satirised the follies of his time in a series of engravings instinct with character, humour and power His *Harlot's Progress*, of six engravings, was published in 1734, and gained him immediate fame. In 1735 he produced his equally celebrated *Rake's Progress*, a series of eight engravings. These were followed by *Marriage à la Mode*, *Industry and Idleness*, and *The March to Finchley*.

Hogben, Lancelot, M.A., D.Sc., F.R.S. (b. 1895), physiologist; Prof. Medical Statistics, 1947–61, Prof. of Zoology, 1941–47, Birmingham Univ.; Prof. Natural History Univ. of Aberdeen, 1937–41; Prof. Social Biology in London Univ., 1930–37. Author of the great popular works *Mathematics for the Million*, *Science for the Citizen*, and *Mathematics in the Making*.

Hogg, James (1770–1835), a Scottish poet of force and originality.

Hogg, Quintin (1845–1903), was an educationist and philanthropist who, purchasing the old Polytechnic Institution in 1882, turned it into a popular college, providing instruction in every department of education at moderate rates.

Hokusai, Katsushika (1760–1849), Japanese artist of the Ukiyo-e (popular school), whose work is highly original and of singular beauty and delicacy. He excelled in landscapes.

Holbein, The Elder (*c.* 1460–1524), a famous German painter, father of Hans Holbein.

Holbein, Hans—The Younger (1497–1543), was born at Augsburg, and settled in London in 1530, where he won the favour of Henry VIII. for whom he painted many portraits.

Holden, Charles, F.R.I.B.A. (1875–1960), British architect, designer of modern public buildings, including British Medical Assсn. Building, Strand, London Underground Railway Head Offices, Piccadilly Circus, new Univ. of London buildings, Bloomsbury.

Holden, Sir Isaac, Bt. (1807–1897), an inventor and manufacturer who achieved fame and fortune in connection with wool-combing inventions.

Hölderlin, Johann Christian Friedrich (1770–1843), friend of Hegel and contemporary of Goethe and Schiller, now considered among the very greatest of German poets. His mind became unhinged in his middle years.

Holford, Sir William Graham, M.A., F.R.I.B.A. (b. 1907), British architect and town-planner. Prof. of Civic Design, Univ. of Liverpool, 1936–47, Prof. of Town Planning, London Univ., 1949–; planned post-war redevelopment of City of London, including precincts of St Paul's Cathedral.

Holland, Rt. Hon. S. G., C.H. (1893–1961), New Zealand Conservative leader, Prime Minister, 1949–57.

Holmes, Oliver Wendell (1809–1894), an American doctor and author of great humour and geniality. His *Autocrat of the Breakfast Table*, *The Professor at the Breakfast Table* and *The Poet at the Breakfast Table* are works of infinite humour and quaintness.

Holst, Gustav Theodore (1874–1934), a British composer of Swedish descent whose compositions include *The Planets* suite, *The Hymn of Jesus*, an opera *The Perfect Fool*, and a choral symphony. Professor of Music and Music Master at St Paul's Girls' School, London, 1905–34. Director of Music at University College, Reading, 1919–23.

Holyoake, George Jacob (1817–1906), an eminent secularist lecturer and author, who was identified with many popular movements, expecially Co-operation, of which he was the historian.

Home, Alexander Frederick Douglas, 14th Earl of P.C. (b. 1903), Foreign Sec., 1960–, Sec. of State for Commonwealth Relations, 1955–60, Lord Pres. of the Council, 1957–60.

Homer (c. 700 B.C.), the most famous of all epic poets. Is supposed to have been a Greek who lived probably at Chios or Smyrna, and has generally been regarded as the author of the *Iliad* and the *Odyssey*, though tradition rather than ascertained fact connects his name with those great poems.

Hood, Samuel, 1st Viscount Hood of Whitley, G.C.B. (1724–1816), a successful British admiral, who in 1793 was in command of the Mediterranean fleet, and showed great capacity in that post, taking and occupying Toulon, and capturing Corsica among other exploits.

Hood, Thomas (1799–1845), an English poet, who, as a prolific writer of serious as well as humorous poems, stands in his own line unique. Of his serious verse, *The Song of the Shirt*, *The Dream of Eugene Aram* and *The Bridge of Sighs* may be cited as the best examples, while his comic poems, notably those of the punning order, are unequalled.

Hooke, Robert (1635–1703), English physicist, a great experimenter and inventor. He was also an architect and drew up a plan for rebuilding London after the Great Fire.

Hooker, Richard (1554–1600), was Master of the Temple from 1585–91, and afterwards Rector of Boscombe. Is famed for his great book on *Ecclesiastical Polity*, and because of his exquisite choice of words, was known as "Judicious Hooker."

Hopkins, Sir Frederick Gowland, O.M., F.R.S. (1861–1947), an eminent English bio-chemist, noted for his important work on proteins and vitamins. In 1929 was awarded the Nobel Prize in Medicine for his discovery of Vitamin D. Pres. of the Royal Society 1931–36, and of the British Association, 1933.

Hopkins, Harry (1890–1946). Franklin Roosevelt's personal assistant. Particularly assisted the President at the important war-time foreign conferences, as his personal representative abroad, in working out the New Deal, and in the administration of Lend-Lease.

Hopkinson, John, D.Sc., F.R.S. (1849–98), English engineer and physicist. Senior Wrangler and Fellow at Cambridge. Studied engineering in his father's works, and set up as a consultative engineer. Specialised in electrical work, and by developing the theory of alternating current and of the magnetic current in dynamos he paved the way to the common use of electricity in daily life. Was Professor of Electrical Engineering at King's College, London, 1890–98.

Hoppner, John, R.A. (1758–1810), English portrait painter born in Whitechapel of German parents; studied at the Academy Schools, winning great distinction and painted portraits of many members of the Royal Family.

Horace, or more properly **Flaccus Quintus Horatius** (65–8 B.C.), the famous Roman satirist and poet, who was the friend of Virgil, and attained immortal fame by his *Satires*, *Epodes*, and *Odes*.

Horner, Arthur (b. 1894), general secretary of the National Union of Mineworkers 1946–59 and a leading British Communist.

Horniman, Annie Elizabeth Fredericka, C.H. (1830–1937). English theatre manager and founder of the repertory system in England. She was the daughter of F. J. Horniman, the traveller and collector, who founded the Horniman Museum in Forest Hill and presented it to the L.C.C. in 1901.

Houdini, Harry (1874–1926), American magician, son of a Hungarian rabbi, world-famed for his escapes from handcuffs, locked chambers, sealed cases under water, etc. His real name was Erich Weiss, and he took his stage name from the French conjuror Houdin. He was a keen student of psychic phenomena and exposed fraudulent mediums.

Housman, Laurence (1865–1959), English playwright, poet, and novelist, younger brother of **Alfred Edward** (1859–1936) also a poet of distinction, a professor of Latin at Cambridge and an eminent classical scholar, author of *A Shropshire Lad*.

Howard, John (1726–1790), earned celebrity for his philanthropic efforts on behalf of prison reform, the pursuit of which eventually exposed him to a fatal fever attack in Russia.

Howard of Effingham, Lord (1536–1624), commander of the fleet which defeated the Spanish Armada, 1588, and took part in the capture of Cadiz, 1596.

Howe, Elias (1819–1867), an ingenious American who was the inventor of the first sewing machine, by which he made a great fortune.

Howe, Julia Ward (1819–1910), American philanthropist and poetess, famous as the authoress of the *Battle Hymn of the Republic* (1861), a leader of the American Suffragette movement, and the first woman to be elected to the American Academy of Arts and Letters.

Howe, Richard, 1st (and last) **Earl** (of first creation), K.G. (1726–1799), the British admiral who in 1758 destroyed Cherbourg and in 1794 won the famous victory over the French off Brest.

Howells, William Dean (1837–1920), American novelist and author.

Hubble, Edwin Powell, B.Sc., Ph.D. (1889–1953), U.S. astronomer at Mount Wilson Observatory from 1919 until his death. Noted for his work on extragalactic nebulæ and with the aid of the 200-in. telescope at Mount Palomar made important discoveries.

Hudson, Henry (c. 1550–1611), was a famous English navigator who discovered the Hudson River, Hudson Strait and Bay, and his two books describing his voyages are of the greatest interest.

Hudson, William Henry (1841–1922), English author and naturalist, who spent his early years in South America, memories of which influenced much of his work. His books include *The Purple Land* (1885), *Green Mansions* (1904), *Afoot in England* (1909) and *British Birds* (1895). The Hyde Park Bird Sanctuary (opened in 1925) was established in his memory, and contains the famous figure of *Rima* by Epstein.

Huggins, Sir William, O.M., K.C.B., F.R.S. (1824–1910), British astronomer who pioneered in spectroscopic photography. Collaborated with his wife, **Margaret Lindsay Murray** (1848–1915), who was also an able astronomer.

Hughes, Thomas (1822–1896), educated at Rugby and at Oxford; practised at the Bar, and became a County Court Judge in 1882. His best-known work is *Tom Brown's Schooldays*.

Hugo, Victor Marie (1802–1885), the great poet, dramatist and novelist who headed the Romantic

movement in France in the early part of the 19th century and made himself a name of the first eminence by his various writings. His dramas of *Hernani*, *Lucrèce Borgia*, *Ruy Blas*, and *Le Roi s'amuse* were in every sense great triumphs. Among his novels, *Notre Dame* belongs to his early period, and *Les Misérables*, *Les Travailleurs de la mer*, and *L'Homme qui rit*, belong to his later life, written while he was living in exile in Guernsey.

Hull, Cordell (1871–1955), U.S. Sec. of State, 1933–44. Awarded the Nobel Peace Prize, 1945

Hull, Gen. Sir Richard Amyatt, K.C.B., D S.O., B.A. (b. 1907), British Army officer who succeeded Field Marshal Sir Francis Festing as C.I.G.S. in 1961.

Humboldt, Baron Friedrich Heinrich Alexander von (1769–1859), German naturalist and explorer whose researches are recorded in his two great books *Voyage de Humboldt et Bonpland* (23 vols., 1805–34) and *Cosmos* (5 vols , 1845–62).

Hume, David (1711–1776), the celebrated historian and philosopher whose *History of England* long held chief place in English historical literature. But Hume's enduring fame rests upon his philosophical writings. He developed the empiricism of Locke into the scepticism inherent in it. His main works are *Treatise of Human Nature* and *Dialogues Concerning Natural Religion*.

Hunt, Brig. Sir (Henry Cecil) John, Kt., C B E, D.S.O. (b. 1910), leader of the successful 1953 British Mount Everest Expedition.

Hunt, (James Henry) Leigh (1784–1859), an English poet, politician and essayist. In 1813 he was fined £500, and sentenced to two years' imprisonment for libelling the Prince Regent, and while in prison wrote his poem, *The Story of Rimini*, and other works. In later life he was a constant contributor to literature and from 1847 enjoyed a pension of £200 a year from the Civil List.

Hunt, Wm. Holman, O.M. (1827–1910), one of the three founders of the Pre-Raphaelite movement, and an artist who achieved distinction by several remarkable paintings, the chief of which is, perhaps, *The Light of the World*, an allegorical work.

Hunter, the brothers William, F.R S (1718–83) **and John**, F R.S. (1728–93), were both famous Scottish physicians. William had remarkable success as a lecturer and obstetrician. His valuable anatomical collection was bequeathed to the Univ. of Glasgow. John showed real genius for anatomy, became one of the greatest surgeons of his day and made many discoveries. His surgical museum forms part of the Museum of the Royal College of Surgeons.

Huss, or Hus, John (1369–1415), the Bohemian religious reformer, was strongly influenced by Wyclif and himself urged reform both of abuses in the church and of doctrine Sentenced to death or recantation he suffered martyrdom on July 6, 1415. His death caused a civil war which lasted for many years.

Hussein ibn Talal (b. 1934), grandson of King Abdullah, succeeded his father Talal as King of Jordan, Aug. 11, 1952

Hutton, James, M.D. (1726–97), an Edinburgh doctor whose geological researches established the fundamental principles of modern geology. Before his time geology did not exist as a science, all was speculation. He drew his evidence from the rocks themselves, and his *Theory of the Earth* is one of the great classics of science.

Huxley, Aldous (Leonard), C L (b. 1894), noted modern writer, grandson of T. H. Huxley and brother of Julian; author of *Crome Yellow*, *Jesting Pilate*, *Brave New World*, *Point Counter Point*, *Ends and Means*, *Grey Eminence*, *The Perennial Philosophy*, etc.

Huxley, Sir Julian Sorrell, M.A , F.R.S (b. 1887), biologist and writer, grandson of T. H. Huxley. Director-General of Unesco, 1946–48. Secy. of Zoological Soc. of London 1935–42.

Huxley, Thomas Henry, F.R.S. (1825–1895), an eminent scientist and author of numerous works covering a great range of research. After the publication of Darwin's *Origin of Species*, Huxley became an ardent evolutionist. His biological work, *Man's Place in Nature*, and his numerous essays were marked by great vigour and clearness of thought, and gave him a leading position. He held numerous important appointments, was President of the Royal Society in 1883, and belonged to many learned societies.

Hyde, Dr. Douglas (1860–1949), the distinguished Irish scholar, historian, poet and folk-lorist. President of Eire, 1938–45.

Hypatia of Alexandria, the only woman mathematician of antiquity. She excited the enmity of Christian fanatics, who raised an agitation against her, and she was put to death in A.D. 415.

I

Ibáñez, Vicente Blasco. (*See* **Blasco-Ibáñez, Vicente.**)

Ibrahim Pasha (1789–1848), an able Egyptian statesman, general, and Viceroy, who, adopted by Mohammed Ali as his son, contributed largely to the success of Egyptian policy during the quarter of a century or more of his influence. His conquest of Syria was a notable feat of generalship. He died a few months after being appointed Viceroy.

Ibsen, Henrik Johan (1828–1906), the Norwegian playwright and poet, moralist, and humanist, whose plays, though arousing considerable opposition at the time, are acknowledged as the work of one of the world's greatest dramatists. A master of technique, charging every detail with significance, fusing the comic with the tragic, Ibsen revolutionised the European theatre. His chief works are *Ghosts*, *The Master Builder*, *The Wild Duck*, *A Doll's House*, *Hedda Gabler* and the poetic drama *Peer Gynt*.

Inge, Very Rev. William Ralph, K C V O , D D. (1860–1954), English divine, Dean of St Paul's, 1911–34; Assistant Master at Eton, 1884–88, Lady Margaret Prof. Camb , 1907–11. Earned the sobriquet "the gloomy Dean " for his incisive and somewhat pessimistic comments on contemporary affairs.

Ingersoll, Robert Green (1833–99), American lawyer, writer, and lecturer, became known by reason of his lectures directed principally against Christianity.

Ingres, Jean Auguste Dominique (1780–1867), a great French historical painter who was elected to the Institute in 1824, and at his death was a Senator of France.

Innocent III. (1160–1216), Pope from 1198, successfully asserted the power of the papacy over such secular princes as the emperor, Philip II. of France, and John of England He promoted the 4th Crusade, initiated the crusade against the Albigensian heretics, and held the 4th Lateran Council. His pontificate marks the zenith of the medieval papacy.

Inonu, General Ismet (b 1884), Prime Min of Turkey, leader of the Republican People's Party founded by Kemal Atatürk whom he succeeded as Pres , 1938–50, after serving as Prime Min from 1923 to Atatürk's death in 1938.

Iqbal, Dr. Sir Muhammad (1875–1938), poet-philosopher of the East, b Sialkot, W Pakistan, acknowledged as a great authority in the world of literature, both in prose and in poetry. He wrote in Urdu, Persian, and English.

Ireland, John (1879–1962), English composer, best known for his setting of Masefield's *Sea Fever*, his chamber music, his 'cello and pianoforte sonata, and especially sonata for pianoforte and violin

Irving, Sir Henry (1838–1905), a great English actor who made his first appearance in London in 1866 and whose first distinct success was as Digby Grant in *Two Roses*. His record at the Lyceum Theatre from 1871 onwards covered a brilliant series of productions, including *The Bells*, his first triumph, *Charles I* , *Eugene Aram*, and a number of Shakespearean impersonations, in some of which, notably Shylock and Hamlet, Irving gave memorable performances.

Irving, Washington (1783–1859), a writer of charming stories and miscellaneous works which won wide favour on both sides of the Atlantic

Isabella of Castile (1451–1504), reigned jointly with Ferdinand V., her husband. During their thirty years' sway Spain was united as a single monarchy, and achieved the height of its greatness, the discovery of America, the conquest of Granada, and the expulsion of the Moors from Spain being among the events of her reign.

Ismail Pasha (1830–95), grandson of Mohammed Ali was a man of modern ideas and great public

spirit, whose policy rendered Egypt practically independent of Turkey, the Sultan confirming him in the position and title of Khedive in 1873. It was his adoption of the idea of the Suez Canal that enabled that work to be successfully carried out. By reckless extravagance he involved himself in difficulties, entailing the sale of his Suez Canal shares to England, the establishment of the dual control of England and France, and his own abdication in 1879, when his son Tewfik succeeded.

Israels, Joseph (1824–1911), outstanding Dutch genre painter of the 19th century.

Ito, Hirobumi, Prince (1841–1909), one of the most enlightened statesmen of Japan. The unparalleled social metamorphosis which Japan underwent in the latter half of the nineteenth century owed much to his guidance and influence. Was four times Premier.

Ivan the Great (1440–1505), succeeded in bringing the scattered provinces of Muscovy under one supreme governmental control, and put an end to Tartar rule.

Ivan the Terrible (1530–84), crowned as first Czar of Russia in 1547, was a strong and autocratic ruler. He furthered internal consolidation and Russian eastward expansion and entered into trading relations with Queen Elizabeth.

J

Jacks, Lawrence Pearsall (1860–1955), Principal of Manchester College, Oxford, 1915–31, and Professor of Philosophy in that College, 1903–31. Entered ministry in 1887 as assistant to the Rev. Stopford Brooke. Editor of the *Hibbert Journal*, 1902–47, and author of several books of religious studies.

Jackson, Andrew (1767–1845), American general who was twice President of the United States.

Jackson, Thomas Jonathan (1824–1863), popularly known as "Stonewall Jackson," was the most brilliant general on the Southern side in the American Civil War. Was accidentally killed at the Battle of Chancellorsville. The term "Stonewall" refers to his dogged resistance at the first Battle of Bull Run.

Jacobs, William Wymark (1863–1943), novelist of quaint and peculiar humour, whose stories and sketches of East End riverside life are inimitable.

Jacquard, Joseph Marie (1752–1834), a French mechanic whose Jacquard loom provided a new and effective method of weaving designs in textile fabrics, and was an invention of the very first rank.

Jagellons, Lithuanian-Polish dynasty, ruled in Poland 1386–1572.

James I. (1566–1625), King of England (1603–25) and, as James VI, King of Scotland (1567–1625). He was the son of Mary Stuart and succeeded to the English throne on the death of Elizabeth. Numerous plots were formed against him, including the Gunpowder Plot of 1605. He persecuted the Puritans, granted many monopolies, and saw the Authorised Version of the Bible published. Described by Henry IV of France as "the wisest fool in Christendom."

James II. (1633–1701) King of England and, as James VII, of Scotland (1685–88), second son of Charles I. As Duke of York he was Lord High Admiral in the Second and Third Dutch Wars, during which New Amsterdam fell to England and was renamed New York. As a Roman Catholic he resigned his office after the Test Act of 1673, was nearly excluded from the Succession, and, when he came to the throne in 1685, aroused and united strong opposition by his attempts to obtain better conditions for his co-religionists. The unsuccessful Monmouth Rebellion, the Bloody Assize, the Declaration of Indulgence, and the Seven Bishops' Trial marked a reign which ended in the flight of the King and the Revolution Settlement of 1689.

James, Henry, O.M. (1843–1916), an Anglo-American novelist and younger brother of William James. Produced a number of notable stories, remarkable for their intellectual subtlety and careful characterisations. For the last thirty years of his life he resided mostly in London. His best-known novels are *The American*, *Daisy Miller*, *The Bostonian*, *The Portrait of a Lady* and *What Maisie Saw*. Became a British subject 1915.

James, William (1842–1910), the great American psychologist and philosopher, brother of Henry James, the novelist. He became Prof. of Philosophy at Harvard University, 1882, and was the founder of the philosophical system known as pragmatism. His first important work, *Principles of Psychology*, 1890, stamped him as one of the most lucid, penetrating and engaging writers of his day, and established him as the foremost protagonist of the physical school in psychology. *Pragmatism*, a new name for some old ways of thinking, appeared in 1907, and established him as a speculative philosopher of a high order.

Jeans, Sir James Hopwood, O.M., F.R.S. (1877–1946), a brilliant mathematician and astronomer who was a lecturer in mathematics at Cambridge and Princeton and secretary of the Royal Society, 1919–29. Author of *The Universe Around Us*, *The Mysterious Universe*, etc.

Jefferies, Richard (1848–1887), an English naturalist, who, between 1873 and the time of his death, wrote some of the most beautiful descriptions of natural scenery and the customs and habits of the rural world that we possess. His *Gamekeeper at Home* and *The Life of the Fields* are books of great power and sympathy.

Jefferson, President Thomas (1743–1826), took part in the American Revolution, and drew up the Declaration of Independence. Twice U.S. Pres.

Jeffreys, George, 1st Baron of Wem (1648–1689), won for himself unenviable notoriety by his harsh and cruel judgments, when he held what is known as the "Bloody Assize." He was made Lord Chancellor, but after the fall of James II. was sent to the Tower and there died.

Jellicoe, Adml. of the Fleet, Earl, G.C.B., O.M., G.C.V.O. (1859–1935), Commander-in-Chief of British Fleet, August 1914 to Nov. 1916, and First Sea Lord, Nov. 1916 to Dec. 1917; Gov.-Gen. of New Zealand, 1920–24.

Jenghiz Khan (1162–1227), the famous Mogul ruler who twice conquered China, and forced the Turks within European confines.

Jenner, Edward, M.D., F.R.S. (1749–1823), an English physican who became celebrated by his discovery of the vaccination system of alleviating smallpox, which has been of such incalculable benefit to mankind. Parliament made him grants amounting to £30,000 which left him still out of pocket.

Jerome, Jerome Klapka (1859–1927), a clever journalist and writer, who made his first success with his humorous book, *Three Men in a Boat*. He founded *The Idler*.

Jerome, St. (340–420), a noted theologian of the 5th century, whose Latin translation of the Scriptures (*The Vulgate*) made him famous. He died at Bethlehem.

Jerrold, Douglas William (1803–1857), playwright and humorist, who enjoyed a long career of success by his contributions to *Punch* (including *Mrs. Caudle's Curtain Lectures*); his play *Black-Eyed Susan* was an enormous success.

Jesus Christ (*c.* 4 B.C.–A.D. 30 or 33), the founder of Christianity and the greatest figure of human history. The main source of information on His life and work is the New Testament. Jesus was born at Bethlehem in Judæa, and was the first-born of His mother Mary. According to Matthew, He was miraculously conceived and Joseph was His foster-father. The family home was at Nazareth in Galilee. Jesus lived at a critical period in Jewish history. He began His three-year mission when He was about thirty. His teaching is summarised in the Sermon on the Mount.

Jiménez, Juan Ramón (b. 1881), Spanish lyric poet who was awarded the Nobel Prize for Literature in 1956.

Jinnah, Mohammed Ali (1876–1948), Indian statesman. The emergence of a separate Moslem state of Pakistan when the British left India was mainly due to his efforts. He was for many years the active President of the Moslem League, and in 1947 became the first Gov.-Gen. of Pakistan. He was a barrister by profession.

Joachim, Joseph (1831–1907), Hungarian violinist and composer of the classical-romantic school of Mendelssohn, Schumann, and Brahms. He

ranks as the greatest solo violinist the world has ever known.

Joan of Arc, St. (1412–1431), the girl whose heroism inspired the French to drive the English out of Orleans, and enabled Charles to be proclaimed King at Rheims. She was burned as a heretic at Rouen. Canonised at St. Peter's, Rome, 1920.

Joffre, Marshal Joseph Jacques Césaire, G.C.B., Hon. O.M. (1852–1931), Commander-in-Chief of the French Armies 1911–17. His handling of his troops during the war was eminently successful. Entered the Army in 1870, and commanded a battery during the siege of Paris.

John XXIII. (b. 1881), elected Pope in 1958 following the death of Pius XII; formerly Cardinal Angelo Giuseppe Roncalli, patriarch of Venice. In Jan. 1959 convened an Oecumenical Council which opened in Rome in Oct. 1962.

John, St., the Baptist (executed A.D. 28), the forerunner of Christ.

John, St., the Evangelist, the son of Zebedee, retired to Patmos after the Crucifixion, but returned from exile to Ephesus later, and there died at a great age, probably *circa* A.D. 99.

John, surnamed "**Lackland**" (1167–1216), King of England from 1199 to his death at Newark after deposition by the Barons in 1216. One of the most detested of English monarchs, but whose reign stands out large in history because of his having granted, under compulsion, the Magna Carta, England's great bulwark of liberty.

John of Gaunt (1340–1399), Duke of Lancaster, son of Edward III. and father of Henry IV., was one of the most powerful English nobles, and was more or less concerned in the leading events of his time. In Wat Tyler's rebellion he had his palace in the Savoy destroyed and was long held in popular hatred.

John, Augustus Edwin, O.M., R.A. (1878–1961), outstanding British painter, especially notable for his portraits. Among others, he painted Lloyd George, Bernard Shaw, and T. E. Lawrence. His works in the Tate Gallery include *The Smiling Woman* and *Galway*.

Johnson, Amy, C.B.E. (1908–1941), was the first woman aviator to fly solo from England to Australia, when she made a record flight to India (6 days to Karachi). Lost her life when flying as a pilot of the Air Transport Auxiliary over the Thames Estuary.

Johnson, Very Rev. Hewlett, M.A., B.Sc., D.D. (b. 1874), Dean of Canterbury, 1931–63. Publs. *The Socialist Sixth of the World, Soviet Strength, Soviet Success.*

Johnson, Dr. Samuel (1709–1784), the great lexicographer and writer, who for a number of years was the most prominent literary man in England. His *Dictionary* was published in 1755, before which he had attained eminence by several works including the *Vanity of Human Wishes*. His *Rasselas* appeared in 1759, and for two years he published *The Idler*, a collection of essays after the style of the *Spectator*. His *Lives of the Poets* appeared in 1781. He was greatly honoured during his life, enjoyed a pension of £300 a year from 1762, at his death was buried in Westminster Abbey, and had the best biography in the language written upon him by James Boswell.

Johnston, Sir Harry (Hamilton), G.C.M.G., K.C.B. (1858–1927), was a daring and successful explorer, who led scientific expeditions into the interior of Africa. Helped to crush the Arab slave trade in East Africa and to add Nyasaland and a large part of N. Rhodesia to the British empire.

Joliot-Curie, Jean Frédéric (1900–58), French physicist. His wife Irène (1896–1956), daughter of Pierre and Marie Curie, was also a distinguished scientist. Their discovery of artificial radioactivity brought them a Nobel Prize in 1935. Both were dismissed from the French Atomic Energy Commission because of their sympathy for communism.

Jones, Ernest Charles (1819–69), one of the best-known leaders of the Chartist movement, was sentenced in 1848 to two years' imprisonment for his revolutionary speeches. He was also a political writer and the author of several poems.

Jones, Sir Harold Spencer, K.B.E., F.R.S. (1890–1960), Astronomer Royal, 1933–55; H.M. Astronomer Cape of Good Hope, 1923–33. His major research was to determine the mean distance of the earth from the sun, 93,004,000 miles.

Jones, Inigo (1573–1652), a noted architect, who became known as "the English Palladio," and built, among other famous structures, the Banqueting Hall at Whitehall and the gateway of St. Mary's at Oxford. He was a Royalist, and suffered severely in the Civil War.

Jones, John Paul (1747–1792), was a Scotsman, who early in life took to the sea, and during the American War of Independence commanded various ships on behalf of the Colonists, and was most daring in his onslaughts upon British vessels. He died in Paris.

Jonson, Ben (1573–1637), a friend of Shakespeare and one of the great poets and dramatists of his age. Was Poet Laureate from 1619. His best plays are *Every Man in his Humour* and *The Alchemist*. Buried in Westminster Abbey.

Josephine, Empress (1763–1814), was the wife of Napoleon I. until he divorced her in 1809 and married Marie Louise. Josephine had previously been married to Vicomte Alexandre Beauharnais, by whom she had two children.

Josephus, Flavius (A.D. 38–*c.* 100), Jewish historian whose *History of the Jewish War* and *Antiquities of the Jews* contained much valuable historical evidence bearing upon Biblical history.

Joule, James Prescott, F.R.S. (1818–1889), one of the greatest of English physicists, famous for his researches on electro-magnetism and for his determination of the mechanical equivalent of heat.

Jowett, Benjamin (1817–93), English scholar remembered as the greatest Master of Balliol College, winning a great reputation for his sympathy and erudition. His outstanding works include translations of the *Dialogues of Plato* and *History of Thucydides*. His Mastership raised Balliol to a proud pre-eminence among the Colleges.

Jowitt, William Allen, Earl, P.C. (1885–1957), Lord High Chancellor in the Labour Governments, 1945–51. Pub. *The Strange Case of Alger Hiss* (1953).

Joyce, James (1882–1941), Irish author who because of the originality, daring, and range of his work exercised a great influence on the younger school of novelists, critics, and poets. Notable among his works are *Portrait of the Artist as a Young Man, Ulysses*, and *Finnegans Wake*.

Juin, Alphonse, Marshal of France (b. 1888), C.-in-C. of French troops in N. Africa, 1942; Res.-Gen. in Morocco, 1947–51; C.-in-C. Allied Forces, Central Europe (NATO), 1951–56.

Julian the Apostate (Flavius Claudius Julianus) (331–363) was Roman Emperor for the last two years of his life, during which period he was an avowed pagan, though previously he had professedly been a Christian. He was slain by an arrow during an expedition against Persia.

Julius Cæsar. (See **Cæsar Caius Julius.**)

Jung, Carl Gustav (1875–1961), Swiss psychiatrist, founder of the Zür School, and a former pupil of Freud (*q.v.*) until 1911, when he formulated a system of analytical psychology. (See Section **J**.)

Junot, Andoche, Duc d'Abrantès (1771–1813), one of Napoleon's great generals, brilliantly successful until defeated by Wellington at Vimeiro.

Jusserand, Jean Adrien Antoine Jules (1855–1932), French author and diplomat. Ambassador to U.S.A., 1902–25. A well-known authority on English literature, his works include *The English Theatre from the Conquest to Shakespeare* (1878), *The English Novel* (1886), *The Literary History of the English up to the Renaissance* (1894).

Justinian I. (Flavius Anicius Justianianus) (483–565) was the Roman Emperor of the East whose fame rests chiefly on his laws. His *Corpus Juris Civilis* remained the accepted text-book of Roman Law to the end of the 9th century, and is still the most important of all monuments of jurisprudence. He reigned from 527 to 565.

Juvenal (Decimus Junius Juvenalis) (60–140), the famous Roman poet and rhetorician of the age of Trajan. His sixteen celebrated *Satires* are the finest in classical literature.

K

Kafka, Franz (1883–1924), Jewish writer, born in Prague, whose introspective work, the bulk of

which was not published till after his early death from tuberculosis, has been widely acclaimed and discussed, and has had a notable influence on later schools, including the Surrealists.

Kālidāsa (*c* A.D. 400), the most illustrious figure in classic Sanskrit literature and one of the greatest Oriental poets. No facts are known about his life and date, but certain evidence places him in the 5th cent. Seven of his works survive: two lyrics, *Ritu-samhara* (The Seasons), and *Megha-dūta* (Cloud Messenger); two epics, *Raghu-vamśa* (Dynasty of Raghu) and *Kumara-sambhava* (Birth of the War-God), and three dramas, *Śakūntalā*, *Mālavikāgnimitra*, and *Vikramorvaśīya*.

Kant, Immanuel (1724–1804), German scientist and philosopher, whose *Critique of Pure Reason*, published in 1781, was the subject of fierce discussion, and involved him in trouble with the Prussian Government as to his religious belief His speculations and the transcendental theories he worked out revealed a marvellous capacity of mind, and his works were of immense influence in shaping the philosophical thought of the 18th and 19th centuries

Kauffmann, Angelica, R A. (1741–1807), the famous Anglo-Swiss painter, who was one of the foundation members of the Royal Academy, and the first woman R.A.

Kaulbach, Wilhelm von (1805–1874), an eminent German painter who illustrated books by Goethe and Schiller

Kean, Charles John (1811–1868), an English actor-manager, son of the tragedian, Edmund Kean Charles Kean married Ellen Tree, and in the 'fifties played with her in a remarkable series of spectacular revivals at the Princess's Theatre in London

Kean, Edmund (1787–1833), one of the greatest tragic actors in the history of the British stage

Keats, John (1795–1821), the great English poet who, though dying at the early age of twenty-five, produced a number of poems which in richness of imagination and beauty of thought are not excelled by anything in the language His *Odes*, his two poems, *Isabella* and *The Eve of St. Agnes*, are exquisite in form and expression

Keble, John (1792–1866), an English clergyman and poet, whose *Christian Year* is one of the most notable works of its class.

Keene, Charles (1823–1891), one of the most talented of the *Punch* artists

Keith, Sir Arthur, F R S. (1866–1953), an eminent anthropologist. Pres. of British Association, 1927. Author of *The Antiquity of Man*, *Religion of a Darwinist*, *A New Theory of Evolution*.

Kellogg, Frank Billings, LL D (1856–1937), was a Judge of the Permanent Court of International Justice, The Hague, 1930–35. American Ambassador to the Court of St. James, 1923–25 Secretary of State, U S.A., 1925–29; chiefly remembered as the originator of the Kellogg Pact. Awarded Nobel Peace prize, 1929.

Kelly, Sir Gerald Festus, P.R.A (b 1879), a successful English portrait-painter whose State portraits of King George VI and Queen Elizabeth were exhibited at the R A. in 1945. President of the Royal Academy, 1949–54.

Kelvin, William Thomson, Lord, P C, O M, G C V.O., F R.S. (1824–1907), the famous scientist and inventor, introduced the dynamical theory of heat. Shortly afterwards he interested himself in submarine telegraphy, and invented numerous important improvements, also doing splendid work in the direction of electrical invention; he covered a vast field and earned a world-wide reputation.

Kemble, Frances Anne (" Fanny ") (1809–1893), was a noted actress in the early part of the 19th century. She was the daughter of Charles Kemble (1775–1854), who was also a celebrated actor, associated in many appearances with his brother, John Philip Kemble and their talented, sister, Mrs. Siddons (*q.v.*).

Kemble, John Philip (1757–1823) was a famous tragedian, and for many years manager of Drury Lane Theatre in London. He was brother to Mrs. Siddons (*q.v.*), who first played with—and overshadowed—him in 1783.

Kempenfelt, Admiral Richard (1718–1782), an English naval officer who saw distinguished service, and sank with his ship the *Royal George* off Spithead, through a shifting of the guns when refitting which caused the vessel to capsize. Some six hundred of the ship's company perished with their admiral.

Kempis, Thomas à (1380–1471), name by which the German mystic and writer Thomas Hammerken was known, was a monk of the St. Augustine order, whose life was mainly spent at a monastery near Zwolle. He was the author of *The Imitation of Christ*, a work which has been translated into all languages, and forms a devotional course which is highly valued.

Kennedy, John Fitzgerald (b. 1917), succeeded Gen Eisenhower as President of the United States, Jan. 20, 1961. Senator from Massachusetts, 1953–60. Democrat.

Kent, William (1684–1748), a leading figure in British art, 1725 until middle of eighteenth century—architecture, landscape gardening, interior decoration, furniture, and painting. Strong Italianate influence. Surviving works: The Great Hall at Holkham, Norfolk, and lay-out at Rousham, Oxfordshire.

Kepler, Johann (1571–1630), renowned German astronomer, assistant to Tycho Brahe (1546–1601), whose measurements he used in working out his laws of planetary motion, which are 1. The planets describe elliptic orbits, of which the sun is one focus 2. The line joining a planet to the sun sweeps out equal areas in equal times. 3 The square of the period of revolution of a planet is proportional to the cube of its average distance from the sun. The explanation of these laws was given by Newton.

Keyes, Admiral of the Fleet, Lord, G.C.B., K C V O, C M G., D S O (1872–1945). Commodore of the submarine service during war of 1914–18, and commanded operations against Zeebrugge in 1918. Director of Combined Operations, 1940–41.

Keynes, John Maynard, 1st Baron, C.B., M.A., F B A (1883–1946), British economist of international reputation Bursar and Fellow of King's College, Cambridge Editor of *Economic Journal*, 1911–46 Principal British Treasury representative at the Versailles peace conference, resigned in protest against plans for reparations, and published his views in *The Economic Consequences of the Peace* (1919). From 1919 onwards engaged in controversial writing on monetary theory. Against the return to the gold standard in 1925. *Treatise on Money* (1930) and *The General Theory of Employment, Interest and Money* (1936) profoundly influenced economic thought and government policy all over the world. Led the British delegation to Bretton Woods and negotiated the American loan agreement of 1945. Married Lydia Lopokova, formerly of the Russian Imperial Ballet, in 1925

Khrushchev, Nikita Sergeyevich (b. 1894), First Secretary of the Soviet Communist Party since 1953, since 1958, when he succeeded Marshal Bulganin, Chairman of the Council of Ministers (Prime Minister). Under his leadership the cruel restrictions of the Stalinist regime have been relaxed and there has been a great advance in scientific achievement, notably in the field of space research

Kidd, Captain William (*c* 1645–1701), was a famous pirate who, taking advantage of an appointment to the captaincy of a British ship, engaged in numerous piratical expeditions under cover of the English flag. He was hanged at Execution Dock in London after a sensational trial at the Old Bailey.

Kierkegaard, Sören (1813–55), Danish philosopher and religious thinker whose views have had great influence on contemporary existentialism. His main work is *Either—Or*.

King, Rt. Hon. (William Lyon) Mackenzie, O.M., C.M G (1874–1950), Prime Minister of Canada, 1921–25, 1926–30 and 1935–48.

Kingsley Charles (1819–1875), English clergyman and novelist, best known for his historical novels *Hypatia*, *Westward Ho!*, *Hereward the Wake* and children's book *The Water Babies*.

Kipling, Rudyard (1865–1936), poet, novelist, and miscellaneous writer. Made himself celebrated while yet a youth by some exceedingly clever and characteristic sketches of Indian life written for the most part while performing journalistic duties in India. He subsequently settled in London and produced a remarkable succession

of stories, sketches, ballads, and poems, all marked by intense vigour. In 1907 was awarded the Nobel Prize.

Kirchhoff, Gustav Robert (1824–87). German physicist. He did important work in electricity and thermodynamics and put spectrum analysis on a firm basis. Published, among other scientific works, *Researches on the Solar Spectrum.*

Kitchener, of Khartoum, Field Marshal Earl, K.G., K.P., G.C.B., O.M. (1850–1916), British soldier. By his victory at Omdurman in 1898 he crushed the Sudanese dervishes and avenged General Gordon. In the early stages of the South African War he assisted Lord Roberts and took over command himself in 1900. C.-in-C. India, 1902–9; Secretary of War, 1914–16. Drowned while on his way to Russia.

Klee, Paul (1879–1940), Swiss artist, studied at Munich, Paris and Rome and later became Professor at Düsseldorf Academy. He lived in a restless, experimental period. His paintings are small-scale, delicate dream-world fantasies, full of poetical content.

Kneller, Sir Godfrey, Bt. (1646–1723), the most celebrated portrait painter of his day in England, who enjoyed the patronage in succession of Charles II., James II., William III., Anne, and George I. He painted the portraits of the members of the Kit-Cat Club, and was buried in Westminster Abbey.

Knox, John (1505–1572), the famous divine and Reformer, who stirred Scotland to mighty religious impulses in the reign of Mary Queen of Scots.

Knox, Edmund George Valpy ("Evoe") (*b.* 1881), editor of *Punch*, 1932–48.

Knox, Rt. Rev. Mgr. Ronald Arbuthnot (1888–1957), Catholic Chaplain at the University of Oxford, 1926–39, and a well-known author. His works include detective stories, among which are *The Viaduct Murder* and *Footsteps at the Lock.*

Knutsford, 2nd Viscount (1855–1931), was Chairman of the London Hospital for over 30 years.

Koch, Robert (1843–1910), the most noted bacteriologist of the time, whose discoveries in connection with the bacillus of tuberculosis have greatly benefited mankind. He also closely studied the causes of Asiatic cholera and bubonic plague.

Kodály, Zoltán (b. 1882), Hungarian composer and teacher. He worked with Bartok in the collection of folk-tunes and his compositions include chamber music, sonatas, songs, the great choral work *Psalmus Hungaricus*, the orchestral suite *Háry János*, and the symphony in C, written in 1961. Pres. of the International Folk Music Council.

Kokoschka, Oskar (b. 1886), Austrian portrait and landscape painter, ranking as one of the world's great interpretative artists. Taught (1920–24) at the Dresden academy of art, lived for a time in Prague before settling (1938) in England.

Koniev, Marshal of Soviet Union, Ivan Stepanovich (b. 1898), one of Russia's outstanding military leaders in the war against Germany, 1941–45. Recalled from retirement in 1961 to command Soviet forces in Germany.

Kosciuzko, Tadeusz Andrzoj Bonawentura (1746–1817), a Polish general and patriot who achieved great distinction in 1794 by his gallant leading of the Polish revolutionary forces against Russia. From 1776 to 1783 took part in the American War of Independence.

Kossuth, Louis (1802–1894), a Hungarian patriot and leader, who in the struggle for his country's freedom in 1849 was for a time successful, but ultimately had to acknowledge defeat, and fled first to Turkey and afterwards to England, where he lived for some years.

Kotelewela, Col. the Rt. Hon. Sir John Lionel, C.H., K.B.E. (b. 1897), Prime Minister of Ceylon, 1953–56.

Kreisler, Fritz (1875–1962), world-famed Austrian violinist, studied in Paris under Massart. First played in the United States in 1888. He composed numerous violin pieces, a quartet, and some operettas. Became an American citizen in 1943.

Krenek, Ernst (b. 1900), Austrian composer of partly Czech descent. He first composed in a neo-classic or anti-romantic style, later the influence of jazz was prominent in his compositions, which include the jazz opera *Jonny spielt auf* and many instrumental works and songs. In 1938 he emigrated to the United States.

Kropotkin, Peter Alexeivich, Prince (1842–1921), anarchist, geographer and explorer, who, after a distinguished career in Russia, his native country, was imprisoned for favouring the political action of a working men's association, but escaped to England. He wrote many important books on socialistic and geographical subjects. Returned to Russia in 1917.

Krüger, Stephanus Johannes Paulus (1825–1904), the Boer leader, was one of the outstanding figures of South Africa in the last half of the nineteenth century. As a small boy he accompanied his family on the Great Trek. He was active in Transvaal politics for many years, and served as President from 1883 to 1900. His attitude towards the Uitlanders (English and other non-Boer white inhabitants of the Transvaal) produced much of the tension which led to the South African War. During the war he made unsuccessful attempts to secure help for the Boers from various European powers.

Krupp, Alfred (1812–1887), the famous German engineer, founded the great gun factories at Essen, which were the largest in the world. By his introduction of the Bessemer plan of casting steel and the steam hammer into Germany, he brought about an important development in heavy breech-loading guns, and built up factories which employed at the time of his death 20,000 workmen.

Kubelik, Jan (1880–1940), Czech violinist—son of a gardener at Michle, near Prague—who at the age of twelve played in public, and was one of the most renowned instrumentalists of his day. His son Rafael (b. 1914), a conductor of international repute, became musical director of the Royal Opera House, Covent Garden, in 1955.

Kublai Khan (1216–1294), a famous Mogul emperor and grandson of Jenghiz Khan. He greatly extended the Mogul empire by conquest, and lived in unparalleled splendour.

L

Lablache, Luigi (1794–1858), a famous bass singer and actor, especially popular in London. He held the position of singing tutor to Queen Victoria.

La Fayette, Marie Joseph Paul Roch Yves Gilbert du Motier, Marquis de (1757–1834), French soldier and humanitarian politician who fought on the side of the Colonists in the American War of Independence and on returning to France became C.-in-C. of the National Guard of Paris. By signing the demand that the king summon the States-General he became the first leader of the French Revolution, but stood out against its later excesses. In 1830 he was instrumental in setting Louis Philippe on the French throne.

La Fontaine, Jean de (1621–1695), the celebrated French poet and fabulist. His fables have been translated into all languages, and are unique.

Lagerlof, Selma, Ph.D. (1858–1940), the famous Swedish novelist who was awarded in 1909 the Nobel Prize for literature. In 1914 was elected the first woman member of the Swedish Academy.

Lagrange, Joseph Louis, Comte (1736–1813), noted French astronomer and mathematician.

Lalande, Joseph Jerome Lefrançais de (1732–1807), a famous French astronomer and director of the Paris Observatory. He founded the Lalande yearly prize for the best astronomical work or observation and wrote a well-known treatise on astronomy.

Lamarck, Jean Baptiste Pierre Antoine de Monnet, Chevalier de (1744–1829), the prominent French zoologist who occupied important scientific posts in Paris. A precursor of Darwin, his name rests mainly on his theory of the evolution of animals, known as Lamarckism. His chief work was the *Histoire Naturelle des Animaux sans Vertèbres.*

Lamb, Charles (1775–1834), one of the most delightful of our essayists. His *Essays of Elia* are characterised by great felicity of expression, much genial humour and an ardent love both of rural life and London life. He was a clerk in the office of the East India Company for thirty-five years. In some of his writings he was assisted by his sister, Mary Lamb, to whom he was greatly devoted.

Lamb, Sir Horace, F.R.S. (1849–1934), a British scientist, was the leading authority on hydro-

dynamics, and did valuable research work on wave motions and electricity.

Lambert, Constant (1905–51), English composer, conductor and critic, musical director of the Sadler's Wells Ballet. His *Rio Grande* for chorus, piano, and orchestra, shows some jazz influence.

Landor, Walter Savage (1775–1864), a writer and poet of strong genius. He wrote a fine poetic tragedy *Count Julian* in 1812, and in later life published several other volumes of poems. The work by which he is best known, however, is his *Imaginary Conversations*.

Landseer, Sir Edwin Henry, R.A. (1802–1873), the most celebrated English animal painter of his time. He designed the lions for the base of the Nelson Monument in Trafalgar Square.

Lane, Edward William (1801–1876), an English writer to whom we owe the most popular translation of the *Arabian Nights*. He was also the author of a number of books dealing with ancient Egyptian and Arabic subjects, and was one of the most prominent Orientalists of the 19th century.

Lanfranc (c. 1005–89), Italian churchman, b. at Pavia, Archbishop of Canterbury, 1070. Closely associated with Duke William of Normandy (William I of England), carried out Church reforms and preserved its independence.

Lang, Andrew (1844–1912), Scottish scholar and writer of great versatility, his numerous works including poetry, fiction, history, fairy tales, folk-lore, and translations from the classics.

Lang of Lambeth, Most Rev. Cosmo Gordon Lang, 1st Baron, P.C., G.C.V.O., D.D. (1864–1945), Archbishop of Canterbury, 1928–42, and of York, 1908–28; Bishop of Stepney, 1901–08.

Langland, William (c. 1330–1400), author of the alliterative poem *The Vision of Piers the Plowman*.

Langton, Stephen (1151–1228), was Archbishop of Canterbury from 1213, and one of the chief instruments in forcing the Magna Carta from John.

Lansbury, Rt. Hon. George (1859–1940). British Labour politician, Chairman of Parliamentary Labour Party, 1931–35, Leader of the Labour Party, 1932–35. M.P. Bow and Bromley, 1910–12, and 1922–40.

Lao-Tzŭ, one of the ancient philosophers of China, who flourished about 600 B.C. The classic upon which his fame rests, *Tao-tê-ching*, was written many years later. (*See* Taoism. Section J.)

Laplace, Pierre Simon, Marquis de (1749–1827), French mathematician and astronomer whose researches on the motions of the solar system and the theory of probability earned him the title of "the Newton of France."

La Rochefoucauld, François, Duc de (1613–1680), a renowned French statesman and writer of the Louis XIV. period. His *Reflections and Moral Maxims* is a classic.

Lasker, Emanuel, Ph.D. (1868–1941), world's chess champion, 1894–1921—defeated by Capablanca (*q.v.*).

Lassalle, Ferdinand (1825–64), founder of the German Socialist movement, and as such exerted deep influence throughout Europe. His life story forms the basis of George Meredith's novel *The Tragic Comedians*.

Lasso, Orlando di (c. 1532–94), Flemish composer and choirmaster, contemporary of Palestrina, and the writer of over 2,000 compositions, including *chansons*, madrigals, and sacred music.

Laszio de Lombos, Philip Alexius, M.V.O. (1869–1937), the most fashionable portrait painter of modern times. President of Royal Society of British Artists, 1930.

Latimer, Hugh (*circa* 1485–1555), the English Reformer who became Bishop of Worcester under Henry VIII., but when Mary came to the throne was condemned as a heretic and burned at the stake.

Laud, William (1573–1645), an eminent ecclesiastic, who, after filling three minor bishoprics, was made Archbishop of Canterbury in 1633. He did much to direct the policy of Charles I., and when trouble followed, he was impeached by the Long Parliament and committed to the Tower. Was tried for treason and beheaded.

Lauder, Sir Harry (MacLennan) (1870–1950), famous singer of Scottish songs and ballads. Composed own songs and wrote own music. Knighted 1919 for services in raising money for war purposes.

Laval, Pierre (1883–1945), French politician, won notoriety over the Hoare-Laval pact in 1935. During the German occupation he was the arch French collaborator, and was afterwards tried for treason and shot.

Lavery, Sir John, R.A. (1856–1941), an eminent portrait painter; Pres. of the Royal Society of Portrait Painters, 1932–41.

Lavoisier, Antoine Laurent (1743–1794), often called the "father of chemistry," was born in Paris, and was the first to establish the fact that combustion is a form of chemical action.

Law, Rt. Hon. Andrew Bonar (1858–1923), Conservative politician. He became leader of the Opposition in 1911, joined the Coalition in 1915, and served as Prime Minister from 1922 until shortly before his death in 1923.

Lawrence, David Herbert (1885–1930), one of the most powerful and original of modern novelists, and as a poet ranked among the best this century has produced. Author of *The White Peacock*, *Sons and Lovers*, *The Plumed Serpent*, etc.

Lawrence, Sir Thomas, P.R.A. (1769–1830), one of the fashionable portrait painters of his day.

Lawrence, Col. Thomas Edward (1888–1935), known as "Lawrence of Arabia," British soldier, archaeologist and explorer. Organised and led the Arabs against the Turks in the war of 1914–18. Author of *The Seven Pillars of Wisdom* (1926), of which an abbreviated edition, *Revolt in the Desert*, was published in 1927.

Leacock, Stephen Butler (1869–1944), Head of Dept. of Economics, McGill University, Montreal, 1908–36; but best known throughout the world as a humorous writer.

Lecky, Rt. Hon. William Edward Hartpole, O.M. (1838–1903), an eminent historian. His best-known works are *The History of England in the Eighteenth Century* and *The History of European Morals*.

Leclerc (de Hauteclocque), General Jacques Philippe, Marshal of France (1902–1947), French soldier of considerable personal popularity. Was Governor of the Cameroons in 1940, declared for the Free French and later led a Free French force from Lake Chad across the Sahara desert to join the Allied Forces in North Africa. Liberated Paris in 1944, commanded French troops in Indo-China, 1946. Killed in air crash in Algeria.

Le Corbusier, pseudonym of Charles-Édouard Jeanneret-Gris (b. 1887), Swiss-born French architect and town-planner whose works and theories with their emphasis on organic planning have profoundly influenced contemporary architecture. Famous for his *ville radieuse* conception of a city and architect of *L'Unité d'Habitation* at Marseilles and of Chandigarh, the new capital of East Punjab.

Lee of Fareham, Viscount, P.C., G.C.B., G.C.S.I., G.B.E. (1868–1947), First Lord of the Admiralty, 1921–22. Minister of Agriculture, 1919–21. Presented Chequers Court to the nation as a residence for British Premiers, 1917.

Lee, Robert Edward (1807–70), was one of the ablest Confederate generals in the American Civil War, and C.-in-C. when the final surrender was made at Appomattox in 1865.

Lee, Sir Sidney (1859–1926), the great authority on Shakespeare, and joint editor with Sir Leslie Stephen of the *Dictionary of National Biography*, exercising undivided control over the completion of that monumental work during the last ten years of its publication.

Leech, John (1817–1864), perhaps the most popular of all the *Punch* artists, whose sketches and cartoons were the life and soul of the paper for many years.

Lehar, Franz (1870–1948), Hungarian composer, chiefly of light operas, which include *The Merry Widow*, *The Count of Luxembourg*, *Frederica*, *The Land of Smiles*.

Leibnitz, Gottfried Wilhelm, Freiherr von (1646–1716), German writer and philosopher and one of the world's supreme intellects. Invented the infinitesimal calculus which he published in 1684, independently of Newton whose previous work on the same subject was published in 1687.

Leicester, Robert Dudley, Earl of (1531–88), son of John, Duke of Northumberland (*q.v.*), was a favourite of Queen Elizabeth. He commanded

the English troops in the Netherlands, 1585–87, and in England before the Armada. Married to Amy Robsart (*q.v.*).

Leighton, Frederick, Baron, P.R.A. (1830–96), English painter whose popular pictures dealt with classical subjects, characterised by delicacy of finish and splendour of colour. Among his more famous paintings are *Venus Disrobing*, *Clytemnestra*, and *The Garden of the Hesperides*. He was also a sculptor.

Lely, Sir Peter (1618–80), the famous painter to whom we owe so many of the portraits of the beauties of the Court of Charles II. He was born at Soest and his proper name was Van der Faes.

Lemnitzer, Gen. Lyman L. (b. 1899), American army officer who succeeded Gen. Norstad as Supreme Allied Commander, Europe, in Jan. 1963.

Lenin, Vladimir Ilyich Ulyanov (1870–1924). Russian revolutionary and statesman, architect of the Russian revolution for which cause he worked both "underground" in Russia and abroad during the years 1893–1917. It was in this period that the revolutionary Social-Democratic party was formed. An uncompromising revolutionary group, known as the Bolsheviks, developed within this party and Lenin was its leading spirit. In April 1917 Lenin and his fellow exiles returned to Russia. After the 1917 November revolution Lenin headed the new government and with intense energy consolidated the revolution, applying Marxist principles without dogmatism to the planning of Soviet social and industrial development.

Leonardo da Vinci (1452–1519), Italian painter, sculptor, architect, scientist, engineer, and musician. His creative power as an artist and scientist mark him as a supreme example of Renaissance genius. He went to Milan *c* 1482 and worked for 16 years in the service of the powerful prince Ludovico Sforza. He was for a time with Cesare Borgia on his campaigns and died in exile as a pensioner of Francis I of France. Among his works are the famous *Last Supper*, *Mona Lisa*, *Madonna of the Rocks*, and *St John the Baptist*.

Leoncavallo, Ruggiero (1858–1919), Italian composer of opera whose *Pagliacci* was his one outstanding success.

Leonidas was king of Sparta at the time of the invasion of Greece by Xerxes, 480 B.C., and led the defence of the Pass of Thermopylæ, where he fell.

Lermontov, Mikhail Yurevich (1814–41), great Russian poet and novelist, exiled to the Caucasus for the passionate, revolutionary poem addressed to Czar Nicholas I. written on the death of Pushkin. He has often been called the poet of the Caucasus, for the stern, mountainous country of his youth and exile had a great influence on his poetry. His novel *A Hero of Our Time* was written while he was at St. Petersburg in 1839. Lost his life in a duel.

Le Sage, Alain René (1668–1747), author of the famous stories *Gil Blas* and *Le Diable Boiteux*, also a dramatist of note.

Lesseps, Vicomte Ferdinand de (1805–94), an engineer of large ideas who, while Vice-Consul at Alexandria, conceived the plan of the Suez Canal, which work was completed in 1869. He afterwards projected the original Panama Canal, which failed.

Lessing, Gotthold Ephraim (1729–81), a noted German critic and dramatic poet, whose most celebrated work was his *Laokoon*.

Leverhulme of the Western Isles, 1st Viscount (1851–1925). Chairman and founder of the soapmaking firm of Lever Brothers, Port Sunlight, which later, by purchase and amalgamation, increased in size and importance to become Unilever Ltd. He was for many years prominent as a business pioneer and man of affairs and one of the most practical exponents of the industrial partnership movement. Presented Lancaster House to the nation, the home of the London Museum.

Leverrier, Urbain Jean Joseph (1811–77), the French astronomer, co-discoverer with John Couch Adams of the planet Neptune.

Lewis, Cecil Day, C.B.E., M.A. (b. 1904), poet and critic. Prof. of Poetry, Oxford Univ., 1951–6. Besides various poetical works has published translations of *The Georgics* and *The Aeneid* of Virgil; also detective novels under pseudonym of Nicholas Blake.

Lewis, Sinclair (1885–1951), an American author who secured his first great success in 1920 with his novel of provincial American life, *Main Street*. *Babbitt*, published two years later, ruthlessly satirised the 100 per cent. disciple of American *Big Business*, and added a new term, "Babbitry," to the American language. Awarded the Nobel Prize for literature, 1930.

Liaquat Ali Khan (1895–1951), leader of the Moslem League (1946) and first Prime Minister of Pakistan after independence in 1947. Assassinated at Rawalpindi.

Lidgett, Rev. Dr. John Scott, C.H., M.A., D.D. (1854–1953), founder of the Bermondsey Settlement (1891); joint editor of the *Contemporary Review*; leader of Progressive Party on L.C.C., 1918–28; a former President of the National Free Church Council.

Lie, Trygve (b. 1896), Sec.-Gen. of the United Nations 1946–52. Formerly a leading Norwegian politician and Foreign Minister, 1941–46.

Liebermann, Max (1847–1935), German impressionist painter. Among his finest pictures are *The Flax Spinner*, *The Woman with Goats*, and *The Net-Menders*.

Li Hung Chang (1823–1901), an enlightened Chinese statesman and general, who by sheer ability rose from a humble position to be Chief Minister, and exercised almost supreme control for a number of years.

Lilburne, John (1614–57), an English political agitator and pamphleteer, who became the leader of the Levellers, the democratic party in the English Revolution.

Linacre, Thomas (*c* 1460–1524), humanist scholar and physician, founder of the College of Physicians. Published translations of Galen's works.

Lincoln, Abraham (1809–65), was a native of Kentucky; in early life he became a lawyer, and was returned to Congress in 1846 from Springfield, Illinois, and in 1861 was elected 16th President of the United States, when he delivered his famous anti-slavery pronouncement, which led to the Civil War of 1861–65. In 1864 he was re-elected, and in the following year was assassinated by John Wilkes Booth.

Lind, Jenny (1820–87), a famous prima donna, "the Swedish nightingale" as she was called, who made a great sensation by her wonderful voice for some seasons in Europe, London and in America, from 1837 onward.

Linnæus, Carl von Linné (1707–78), a tireless Swedish doctor and scientist who became one of the most distinguished of naturalists, and the founder of modern botany. His *Systema Naturae* was published in 1735, and other monumental works followed. First to expound the true principles for defining genera and species.

Lippi, Fra Filippo (1406–69), one of the great artists of the Italian quatrocento, whose frescoes can be seen in Prato Cathedral. His son Filippino (1457–1504) was equally gifted and executed many great works, including frescoes in the Carmine, Florence, and the altar-piece *Virgin and Saints* in the Uffizi Gallery.

Lippmann, Gabriel (1845–1921) French physicist, whose more important work was in the field of colour photography. His numerous inventions include the capillary-electrometer, which bears his name, and many other delicate instruments. Awarded the Nobel Prize for Physics, 1908.

Lippmann, Walter (b. 1889), American journalist, whose column in the New York *Herald Tribune* has a wide influence.

Lipton, Sir Thomas Johnstone, Bt., K.C.V.O. (1850–1931), after an adventurous early career in America, started shopkeeping in his native Glasgow, and in course of a few years became the largest shopkeeper in the world. Was renowned for his charities, and his attempts to win the America's Yachting Cup.

Lister, Lord, P.C., O.M., F.R.S. (1827–1912), achieved renown for his discovery of the antiseptic treatment which has accomplished so much on behalf of surgery. Pres. of Royal Socy. 1895–1900; and of British Assn. 1896.

Liszt, Franz (1811–86). Hungarian pianist and composer, whose brilliant playing astonished

and delighted Europe and rather overshadowed his importance as a composer. He originated the symphonic poem. His daughter Cosima married Wagner.

Litvinov, Maxim Maximovich (1876–1952), Russian diplomat and statesman; Soviet Diplomatic Agent to Great Britain, 1917, Commissar for Foreign Affairs, 1929–39; Soviet Ambassador to United States, 1941–43.

Livingstone, Dr. David (1813–73), the great Scottish explorer and missionary, whose discoveries in Africa included the course of the Zambesi, the Victoria Falls, and Lake Nyasa. He opened up Central Africa to the influences of Christianity, and stirred the public conscience to the horrors of the Slave Trade In 1871 considerable apprehension was felt in regard to his fate, but he was discovered by H. M. Stanley at Ujiji near Lake Tanganyika

Lloyd, Marie (1870–1922), English music-hall artist and genius of Cockney comedy.

Lloyd George of Dwyfor, Earl, O.M. (1863–1945). Chairman of the Liberal Party, 1924–31. Prime Minister, 1916–22 M.P for Caernarvon, 1890–1944. As a War Premier he displayed activity, resourcefulness, and driving power, which proved a tremendous influence in bringing about the defeat of Germany; and at the Peace Conference, in conjunction with Clemenceau and President Wilson, he was a master spirit. His daughter **Lady Megan Lloyd George** who was Liberal M.P. for Anglesey from 1929 to 1951 joined the Labour Party in 1955.

Locke, John (1632–1704), one of the great English liberal philosophers and founder of empiricism the doctrine that all knowledge is derived from experience. His chief work in theoretical philosophy, *Essay Concerning Human Understanding*, was written just before the revolution of 1688 and published in 1690 Other writings include: *Letters on Toleration*, *Treatises on Government*, and *Education*.

Lombroso, Cesare, M.D. (1836–1909), famous Italian criminologist; in 1889 published his monumental work *L'uomo delinquente*, in which he put forward the theory that there was a definite criminal type which could be distinguished from the normal type, both anatomically and psychologically. He did much by his writings to hasten prison reform.

Lomonosov, Mikhail Vasiliyevich (1711–65), Russian poet, philosopher, and scientist, closely associated with the foundation of Moscow University in the reign of the Empress Elizabeth.

London, John Griffith ("Jack") (1876–1916), an American novelist who led an adventurous life and wrote many popular novels and stirring books of adventure.

Longfellow, Henry Wadsworth (1807–82), an American poet who produced a number of volumes of poetry of great purity of thought and beauty of language. Author of *Hiawatha*

Lonsdale, Dame Kathleen, D B E, F.R S. (b 1903), Professor of Chemistry and head of the Dept. of Crystallography, Univ. College, Univ of London. Her publications include *X-Rays and Crystals*, *International Tables for X-Ray Crystallography*, and *Removing the Causes of War*.

Lonsdale, 5th Earl of, K G., G C V.O (1857–1944), was a well-known sportsman whose special interests were horse-racing, hunting and boxing, the Lonsdale belts having been founded by him

Lope de Vega Carpio, Félix (1562–1635), founder of the Spanish drama, and one of the great figures of Spanish literature. He was one of the most prolific of writers, his dramatic productions alone numbering 1500 plays, of which some 450 survive.

Louis IX. (1214–70), St. Louis, king of France, crusader, and peace-maker, fulfilled the medieval ideal of the knightly king. Memoirs by the Sire de Joinville.

Louis XIV. (1638–1715), ruled France as absolute monarch after Mazarin's death in 1661, having come to the throne at the age of 5. Asserted French supremacy but had to face coalition of European powers (League of Augsburg and the Grand Alliance). The war of the Spanish succession and his own extravagance exhausted France. Revoked Edict of Nantes (1685). The magnificent palace at Versailles is a fitting monument to one who considered himself the most powerful monarch in Christendom.

Louis XV (1710–74), French king during whose reign France was involved in the war of the Austrian succession, and the Seven Years war which resulted in the loss of Canada, India, and Senegal to England. Among his mistresses were the celebrated Mme de Pompadour and Mme du Barry

Louis XVI. (1754–93), king of France whose history is the history of the French Revolution. Dominated by his queen, Marie Antoinette, faced with court intrigue, the cost of French intervention in the war of American Independence and the ruin of France's credit, the French Revolution began with the calling of the States-General in 1789 Executed 21 January 1793

Louis, Joe (b. 1914), world's heavyweight boxing champion. Established a record by successfully defending his title twenty-four times in the years 1937–48. Retired from the ring in 1949.

Low, Archibald Montgomery, D.Sc (1888–1956), a distinguished British scientist who had many inventions to his credit connected with wireless, television, coal and petrol engines, anti-aircraft and anti-tank rocket apparatus.

Low, David Alexander Cecil (b. 1891), the well-known cartoonist, creator of Colonel Blimp. Joined the *Manchester Guardian* in 1953, having previously been on the staffs of the *Daily Herald* and *Evening Standard*

Lowell, James Russell (1819–91), an American writer and poet of singular power and humour.

Loyola, St. Ignatius (1491–1556), was the founder of the order of Jesuits.

Lucretius (Titus Lucretius Carus) (99–55 B C.), great Roman poet of antiquity, whose life-work was the poem *On Nature* (*De rerum natura*) in six books, the first two of which set out the atomic theory of matter as understood by Epicurus.

Ludendorf, General Erich von (1865–1937), was Chief of Staff, and shared with Hindenburg the military leadership of Germany during the Great War Largely responsible for the victory of Tannenberg and the successes of 1915.

Lugard, Frederick, Lord (1858–1945), British colonial administrator, a man of abounding energy, initiative, tact and firmness, and possessing considerable military abilities. Helped to build up the British dominions in tropical Africa (Nyasaland, Uganda, Nigeria) and to establish the principles of British African administration, notably the system of " indirect rule " through native rulers. In 1922 published the *Dual Mandate in Tropical Africa*, which set out the thesis that Europe is in Africa for the reciprocal benefit of her own industrial classes and the native races

Luther, Martin (1483–1546), leader of the Protestant Reformation in Germany, entered the order of Austin Friars in 1505, ordained priest in 1507, taught at Wittenburg university and preached in the town church Until 1517 he was an orthodox Roman Catholic His first idea of revolt occurred when he saw indulgences being sold, a practice which he openly condemned. For this he was excommunicated, and summoned before the Diet at Worms, where he made a memorable defence. He then separated himself from the Roman Catholics, and began to preach the Reformed Religion, his doctrine being formulated in the confession of Augsburg. He lived to see the principles of the Reformation widely established. (*See* **Lutheranism, Section J.**)

Luthuli, Albert (b 1899), ex-Zulu chief, former Pres. of the now banned African National Congress, who has upheld non-violence in face of cruel laws against his people in S. Africa. Nobel Peace Prize, 1960; Rector Glasgow Univ., 1962.

Lutyens, Sir Edwin Landseer, O.M. (1869–1944), English architect; designed and restored many country houses and castles (e g., Lindisfarne), architect Hampstead garden suburb, 1908. Other works include the Cenotaph in London, city plan and viceroy's house, New Delhi, British Embassy, Washington, Liverpool R C. cathedral. Pres. Royal Academy, 1938–43

Lysenko, Trofim (b. 1898), Russian biologist whose concept of genetics, that environmental experiences can change heredity, though discredited in scientific circles outside the U.S.S.R.,

was accepted there as an official dogma until 1953.

Lytton, Edward George Earle Bulwer, 1st Baron, P.C., G.C.M.G. (1803–73), a prolific novelist and dramatist, whose romantic stories made him famous, and included *Pelham*, *The Last Days of Pompeii*, and *The Caxtons*.

Lytton, Sir Henry Alfred (1867–1936), was a noted British actor who scored many successes, chiefly playing Gilbert and Sullivan roles

M

Macadam, John Loudon (1756–1836), Scottish engineer who invented the process of road-repairing which bears his name.

MacArthur, General Douglas, Hon. G.C.B., D.S.C., D.C.M. (b. 1880), American soldier famous for his gallant defence of the Philippines against the Japanese in 1941–42. Relieved of his commands in the Far East during the Korean campaign by President Truman in April 1951.

Macaulay, Rose, D.B.E. (1881–1958), an English authoress and literary critic. Among her literary successes are *Potterism*, *Dangerous Ages*, *Told by an Idiot*, *Orphan Island* and other novels noted for their keen satirical wit and devastating exposure of the follies of her time.

Macaulay, Thomas Babington, Lord (1800–59), the most brilliant historian of the Victorian era. His fame was assured by his *Essays* and *Lays of Ancient Rome*, and his *History* did more than confirm it. He was a son of Zachary Macaulay (1768–1838), the anti-slavery agitator, and sat in Parliament as member for Calne for some years, also serving for five years as a member of the Supreme Council of Calcutta On his home-coming, he again entered Parliament as member for Edinburgh, and gained a new celebrity by his speeches. He at different times filled the offices of Paymaster-General and Secretary for War. Both Lord Macaulay and his father lie buried in Westminster Abbey.

Macbeth, according to Holinshed's *Chronicle*, was the usurping Scottish king who succeeded Duncan, whom he murdered. Macbeth was slain by Duncan's son Malcolm in 1056, after a reign of seventeen years. His history forms the subject of Shakespeare's celebrated tragedy.

MacCarthy, Sir Desmond, F.R.S.I., Hon. D.Litt., Hon. LL.D. (1877–1952), journalist and critic who became dramatic critic to *The Speaker*, 1904, and *The New Statesman*, 1913, where he soon made a reputation both for the substance and style of his writings. He edited *The New Quarterly*, 1907–10 and later *Life and Letters*. Latterly was literary critic to *The Sunday Times*.

Malvern, 1st Viscount, Godfrey Martin Huggins, C.H., K.C.M.G., F.R.C.S. (b. 1893), Prime Min. of S. Rhodesia, 1933–53 and of the Federation of Rhodesia and Nyasaland, 1953–56.

Manet, Edouard (1832–83), French Impressionist painter, whose pictures *Olympia* and *Lola de Valence* have been acclaimed masterpieces.

Mann, Thomas (1875–1955), German writer who won immediate world recognition at the age of 25 with his novel *Buddenbrooks*. His liberal

humanistic outlook had developed sufficiently by 1930 for him unerringly to expose the nature of National Socialism. He left Germany in 1933 to live in Switzerland and then settled in the United States. Awarded the Nobel Prize for Literature in 1929; E. and W. Germany combined to honour him with the Goethe Prize in 1948. His best-known works, apart from many volumes of essays, stories, and shorter novels, are *The Magic Mountain* (1924), the *Joseph* tetralogy (1935–43), *Dr. Faustus* (1947) and *Felix Krull* (1954).

Mann, Tom (1856–1941), was a prominent British Labour leader for more than 50 years.

Manning, Henry Edward, Cardinal (1808–92), Cardinal Archbishop of Westminster 1875–92, was a prominent Anglican Churchman up to 1851, when he joined the Church of Rome.

Mansfield, Katherine (1890–1923), short-story writer, born in Wellington, New Zealand, whose work was strongly influenced by the short stories of Chekov. Her second husband was John Middleton Murry, author and literary critic.

Manson, Sir Patrick, G.C.M.G., M.D., F.R.S. (1844–1922), an eminent physician who specialised in parasitology and became physician and medical adviser to the Colonial Office. He was the first to formulate the hypothesis that the malarial parasite was transmitted by the mosquito. The joint work of Sir Patrick Manson and Sir Ronald Ross rendered habitable vast areas of the earth hitherto closed.

Manuzio, Aldo Pio (1450?–1515), Italian printer, founder of the Aldine press in Venice, which for just over a century issued books famed for their beautiful type and bindings.

Manzoni, Alessandro Francesco Tomaso Antonio (1785–1873), Italian writer, whose romantic novel *I Promessi Sposi* ("The Betrothed") is generally regarded as the most important work in Italian literature after "The Divine Comedy."

Mao Tse-tung (b. 1893), great leader of the Chinese people. Chairman of the Central Committee of the Chinese Communist Party since 1936 and Chairman (equivalent to President) of the People's Republic of China from 1949 (when it was first established following the military defeat of the Nationalist forces) until the end of 1958 when the duties of President were relinquished.

Marat, Jean Paul (1743–93), one of the leading actors in the French Reign of Terror. Killed by Charlotte Corday.

Marconi, Guglielmo Marchese (1874–1937), Italian electrical engineer celebrated for his development of wireless telegraphy. With a home-made apparatus he sent long-wave signals over a distance of 1 mile in 1895. He came to England in 1896 and established the Marconi Company in 1897. Succeeded on Dec. 12, 1901 in transmitting and receiving transatlantic signals. Awarded Nobel Prize for Physics, 1909. The King of Italy made him a marquis in 1929.

Marco Polo. (*See* **Polo, Marco.**)

Marcus Aurelius Antoninus (121–180), the greatest of Roman emperors and a disciple of the stoics.

Maria Theresa (1717–80), Archduchess of Austria, Queen of Bohemia and Hungary, a woman of remarkable strength of character and ability, succeeded her father Charles VI., as monarch of the Hapsburg dominions. She was an enlightened ruler and has been called a "benevolent despot."

Marie Antoinette Josephe Jeanne (1755–93) was daughter of the Empress Maria Theresa and the Emperor Francis I. of Austria, and became wife of Louis XVI. of France. She entered with spirit into the gaiety of French Court life, and drew down upon herself much popular hatred in consequence. In the terrible events which followed the outbreak of the Revolution she was one of the chief sufferers, but bore her fate with dignity and resignation, and met her death on the scaffold with unflinching courage.

Marie Louise (1791–1847), daughter of Francis I. of Austria, became wife of Napoleon in 1810, and bore him a son. (*See* **Napoleon II.**)

Marius, Caius (*c.* 155–86 B.C.), the famous Roman general of humble birth who became tribune (119 B.C.), praetor (115 B.C.), propraetor in Spain (114 B.C.) and was seven times consul. Married an aunt of Julius Caesar.

Mark Antony. (*See* **Antonius, Marcus.**)

Marlborough, John Churchill, 1st Duke of (1650–1722), brilliant soldier, the victor of Blenheim, Ramillies, Oudenarde, and Malplaquet. Married to Queen Anne's favourite, Sarah Jennings.

Marlowe, Christopher (1564–93), one of the greatest of the Elizabethan dramatists. His principal plays are *Dr. Faustus*, *Tamburlaine the Great*, *Edward II.*, and *The Jew of Malta*. He was killed in a tavern brawl at Deptford.

Marryat, Captain Frederick (1792–1848), an exceedingly popular writer of sea stories. Author of *Peter Simple*, *The King's Own*, *Jacob Faithful*, and *The Children of the New Forest*.

Marshall, General George Catlett (1880–1959), American soldier and statesman; Chief of Staff of U.S. Army, 1939–45. Initiated the American offer of aid to Europe, which led to the European Recovery Programme. Awarded Nobel Peace Prize, 1953.

Martial (Marcus Valerius Martialis) (A.D. *c.* 40–A.D. *c.* 104) was born at Bilbilis in Spain, but spent the greater part of his life in Rome, where he acquired much fame as a poet and epigrammatist.

Marvell, Andrew (1620–78), English poet, satirist and diplomatist, friend of Milton, who was best known for his many prose satires and lampoons.

Marx, Heinrich Karl (1818–83), German philosopher and socialist and lifelong partner and friend of Engels with whom he collaborated in writing many important works on socialism and in developing his theories of dialectical materialism. After being expelled from the continent he settled in London where he wrote his monumental work *Das Kapital*. Communism is based on the teachings of Marx.

Mary I. (1516–58), daughter of Henry VIII. and Catherine of Aragon. Was Queen of England from 1553 to her death. She was a strenuous Roman Catholic, and entirely reversed the religious order of things during her brief reign, persecuting, imprisoning, and burning at the stake many of the Protestant reformers, nearly three hundred persons being put to death as heretics. She married Philip of Spain in 1554.

Mary II. (1662–94), daughter of James II. Came to the English throne in 1689, having been married to her cousin, William of Orange, eleven years previously. After assenting to the "Declaration of Rights," they reigned jointly until her demise.

Mary, H.M. Queen, K.G., K.T., G.C.V.O. (1867–1953), Queen Consort of George V.

Mary, Queen of Scots (1542–87), daughter of James V. of Scotland, married to the Dauphin of France at sixteen years of age. On the death of her husband in 1560 she returned to Scotland, and for a time was the acknowledged Queen of the Scots. In 1565 she married Lord Darnley, who a year later was murdered and Mary married Bothwell. The Scottish nobles rebelled against Mary, and she was made prisoner and confined in Loch Leven Castle, compelled to abandon Bothwell and to sign an Act of Abdication in favour of her son. She escaped to England, sought the protection of Elizabeth, and was imprisoned for nineteen years in various castles, and ultimately beheaded on a charge of conspiracy. She was buried in Peterborough Cathedral but after her son James I. of England ascended the throne her remains were removed to Westminster Abbey.

Masaryk, Jan Garrigue (1886–1948), son of Thomas Masaryk. Served as Czech Minister in London, 1925–38 and as Foreign Secretary, 1940–48. His sudden and tragic death removed a cultured and lovable citizen of the world.

Masaryk, Thomas Garrigue (1850–1937), Czech philosopher and statesman; founder and first President of Czechoslovakia, 1918–35.

Mascagni, Pietro (1863–1945), Italian composer, whose brilliant one-act opera *Cavalleria Rusticana* produced in 1890 brought him sudden celebrity. None of his later operas was as successful.

Masefield, John Edward, O.M., C.L. (b. 1878), English poet laureate (since 1930), playwright, and novelist. Most popular among his poems are the *Salt-Water Ballads*, *Reynard the Fox*, and *Right Royal*.

Maskelyne, John Nevil (1839–1917), famous illusionist who exposed the mysteries of the Davenport spiritualistic quacks.

Mason, Alfred Edward Woodley (1865–1948), an English novelist, author of many popular

stories of adventure including *The Four Feathers* and *Fire Over England*.

Massenet, Jules Emile Frédéric (1842–1912), French composer whose melodious compositions include songs, orchestral suites, oratorios, and 23 operas, among them *Manon* and *Thaïs*.

Massine, Léonide (b. 1896), a famous Russian dancer who was for some years Ballet Master at the Roxy Theatre, New York. Among his more famous ballets are *The Good Humoured Ladies*, *Boutique Fantasque*, *Pas d'Acier*, *Les Matelots*, *Le Beau Danube* and *Les Présages*.

Masters, Edgar Lee (1869–1950), American poet who occupies a permanent place in American literature by the publication in 1915 of his *Silver Spoon Anthology*, a hundred poems relating the real character as opposed to the eulogistic inscriptions on their tombstones of the dead in a typical American township.

Matisse, Henri (1869–1954), French painter, the foremost member of a group known as *les Fauves*. His work is remarkable for its use of pure and brilliant colour and its reliance on colour variations to express form and relief.

Matsys or **Metzys, Quintin** (1466–1530), a distinguished Flemish painter, who was originally a blacksmith He excelled in Scriptural subjects.

Maugham, (William) Somerset, C.H , C L. (b. 1874), British novelist, playwright, and short-story writer. Born in Paris, he qualified as a doctor, but soon abandoned medicine for literature, achieving a great success with his first novel in 1897, *Liza of Lambeth*, a study of slum life. He has travelled widely which has given him a deep insight into human nature As a playwright he has been equally successful. His last work *Points of View* was published in 1958.

Maupassant, Henri René Albert Guy de (1850–93), the famous French author and writer of short stories, was a friend of Flaubert, Zola, and Daudet. He was the greatest of all European short-story writers, standing alone in grace, wit and epigram.

Mauriac, François (b. 1885), French novelist whose works are regarded as among the chief literary productions of to-day. In addition to a long series of novels he has written many critical works and essays. Leader-writer for *Figaro*; Nobel Prizewinner, 1952.

Maurois, André, K.B.E. (b. 1885), French biographer, novelist and essayist who has written lives of Shelley, Disraeli, Byron, Voltaire, Fleming, and others

Maxim, Sir Hiram Stevens (1840–1916), the inventor of the famous automatic quick-firing gun.

Maxton, James (1885–1946), was a prominent Socialist politician; M.P. for the Bridgeton Divn. of Glasgow, 1926–46. Chairman of I.L.P. 1926–31 and 1934–39.

Maxwell, James Clerk (1831–79), Scottish physicist who wrote his first scientific paper at the age of 15. Was Professor of Natural Philosophy at Aberdeen, 1856, and for eight years held the same post at King's College, London, 1860–68. In 1871 he became the first holder of the new Professorship of Experimental Physics at Cambridge University His best-known work is his treatise on electricity and magnetism, published in 1873. He made the discovery that founded the electro-magnetic theory of light, and to his electrical researches the advent of wireless is due.

Mazarin, Jules (1602–61), an Italian Cardinal who became chief Minister of State under Louis XIV., and was for a number of years the practical ruler of France He succeeded Richelieu

Mazeppa-Koledinsky, Ivan Stepanovich (1644–1709), the hero of Byron's poem, was a real personage, and a Pole, and was tied naked on the back of a wild horse, and so sent out across the Russian desert, for an intrigue with a noble's wife. He was liberated by Cossacks and afterwards attained an honourable position.

Mazzini, Giuseppe (1805–72), an Italian patriot, who, in his endeavours to secure the independence of Italy, incurred the disfavour of the authorities, and was compelled to leave the country. He started a newspaper called *Young Italy* at Marseilles, and in 1837 came to London, and kept up his attacks upon existing governments. In 1848 he was back in Rome and was elected dictator of the Roman Republic. He was not allowed to hold this position long, however, for the French occupied Rome and Mazzini was driven to England again. The unification of Italy was accomplished in other ways than those advocated by Mazzini, but he lived to see Victor Emmanuel King of United Italy

Medici, the famous Florentine family who combined the career of merchants and bankers with the exercise of political power and patronage of the arts. Cosimo the Elder (1389–1464) was for over thirty years the virtual ruler of Florence. He was wealthy, cultivated, liberal, and a consummate statesman. His illustrious grandson, Lorenzo the Magnificent (1449–92), poet, friend of artists and scholars, governed the state in great munificence. His grandson, Lorenzo, was the father of Catherine de' Medici, Queen of France (*q.v.*). Then the family had some reverses until Cosimo (1519–74), one of the most able rulers of the 16th cent., became Duke of Florence and then Grand-Duke of Tuscany, which title the Medicis held until 1737.

Mehul, Etienne Nicolas (1763–1817), French operatic composer, *Joseph* being considered his masterpiece. In his early years much influenced by Gluck

Melanchthon, Philip (1497–1560), German scholar and humanist who assisted Luther and wrote *Loci communes*, the first great Protestant work on the principles of the Reformation.

Melba, Dame Nellie, G.B E. (1861–1931), the celebrated Australian soprano, b. in Richmond (Victoria), who made her operatic début in Brussels in 1887.

Melbourne, 2nd Viscount (1779–1848), Queen Victoria's first premier, holding office over six years, and identified with many important Liberal measures

Mendel, Gregor Johann (1822–84), Austrian botanist. After joining the Augustinian order, he moved to the monastery at Brünn where he afterwards became Abbot and taught natural history in the school there. His main interest, however, was the study of inheritance, and his elaborate observations of the common garden pea resulted in the famous law of heredity which to-day bears his name. His hypothesis was published in 1866 but no attention was given to it until 1900.

Mendeleyev, Dmitry Ivanovich (1834–1907), Russian chemist who made important contributions to physical chemistry and general chemical theory. First to discover the critical temperatures and formulated the Periodic Law of atomic weights Element 101 is named after him

Mendelssohn-Bartholdy, (Jacob Ludwig) Felix (1809–47), German composer, grandson of Moses Mendelssohn, the philosopher. He belongs with Chopin and Schumann to the early 19th century classic-romantic school, and his music has a delightful delicacy and melodic beauty He was conductor of the famous Gewandhaus concerts at Leipzig for a time and often visited England. Frequently performed are his overtures *A Midsummer Night's Dream* and *The Hebrides* (or *Fingal's Cave*), written in his youth, two oratorios *St. Paul* and *Elijah*, the violin concerto in E minor, the piano works *Variations Sérieuses* and *Songs without Words*, and the *Scotch* and *Italian* symphonies. The name Bartholdy was added to the surname when his father abandoned Jewry.

Mendès-France, Pierre, LL.D (b 1907), French statesman. His skilful diplomacy and energy helped to solve the many problems that faced his country when he took office as Prime Minister in June 1954. His government was overthrown on his Algerian policy in Feb. 1955. Leader of the Radical Party minority which did not support the de Gaulle constitution. Defeated in General Election Nov. 1958.

Menuhin, Yehudi (b 1916), violin virtuoso, one of the greatest musical prodigies of the 20th century. Born in New York of Jewish parentage; made his first London appearance in the San Francisco Orchestra, 1929.

Menzies, Rt. Hon. Sir Robert Gordon, K.T., C.H., Q.C. (b. 1894), Australian Liberal leader; Prime Minister, 1939–41 and since 1949.

Mercator, Gerhardus (1512–94), the Flemish geographer who invented a celestial and a terrestrial globe, by which he introduced his famous projection, in which meridians and parallels of latitude cross each other at right angles, both

being indicated by straight lines. This greatly simplified navigation.

Meredith, George, O.M. (1828–1909), novelist and poet, "the Grand old Man of English letters." His works are rich in imagery, poetry, wit, and characterisation, and as a delineator of womanhood he is unsurpassed. Among his great novels are *Ordeal of Richard Feverel*, *Evan Harrington*, *Rhoda Fleming*, *The Egoist*, *Diana of the Crossways*, and *The Amazing Marriage*.

Mesmer, Friedrich Anton (1733–1815), was a German doctor who founded the system of mesmerism or animal magnetism.

Mestrovic, Ivan (1883–1962), a Dalmatian sculptor, recognised as one of the leading European sculptors of his day. The Tate Gallery and the Victoria and Albert Museum have examples of his work.

Metastasio, Pietro (1698–1782), the celebrated Italian librettist who provided texts for such composers as Gluck, Handel, Haydn, and Mozart. He lived in Vienna as court poet and his real name was Pietro Bonaventura Trapassi.

Metchnikov, Ilya (1845–1916), an eminent Russian biologist; Nobel Prize for Medicine, 1908.

Meyerbeer, Giacomo (1791–1864), was born in Germany, but spent most of his life in Paris, where he produced all his great operas, which include *Robert le Diable*, *Les Huguenots*, and *L'Africaine*.

Meynell, Alice (1849–1922), English poet and essayist, wife of **Wilfred Meynell** (1852–1948), editor of the Catholic paper *Merry England*

Michelangelo (Michelagniolo Buonarroti) (1475–1564), the renowned Italian painter, sculptor, architect and poet, whose genius was such a power in beautifying the churches of Rome and Florence Was the last and in some respects the greatest of the Italian sculptors, while his large paintings, particularly *The Last Judgment*, in the Sistine Chapel, are no less famous

Michelet, Jules (1798–1874), a noted French historian and author.

Michelson, Albert Abraham (1852–1931), American physicist, born in Poland. Designer of an interferometer for estimating the diameters of stars. Collaborated with E W Morley in the *Michelson-Morley* experiment to measure the velocity of the earth through the "ether" which led to the conclusion that the ether is non-existent and had great value for Einstein's theory of relativity Was the first American scientist to win the Nobel prize for Physics, 1907, in which year he was also awarded the Copley Medal.

Mickiewicz, Adam (1798–1855), greatest Polish poet and revolutionary. Chief works *The Ancestors*, *Pan Tadeusz*.

Mill, John Stuart (1806–73), achieved high reputation by his numerous works on philosophical questions. He was an ardent liberal and leader of the utilitarian school of philosophy. Radical M.P for Westminster, 1865–68, died in Avignon. His chief works are *Principles of Political Economy*, *System of Logic*, *On Liberty*.

Millais, Sir John Everett, Bt., P R.A (1829–96), was at one time the most prominent of the English Pre-Raphaelites, but soon cast himself free from their mannerisms, and began the production of a long series of famous pictures Among his numerous works we have room to mention only *The Eve of St. Agnes*, *Autumn Leaves*, *The Order of Release*, *Effie Deans*, *Chill October*, and *Bubbles*.

Millet, Jean François (1814–75), one of the greatest of French painters of pastoral subjects, his celebrated work *The Angelus* is universally known by its numerous reproductions

Millikan, Robert Andrews (1868–1953), American physicist who is world famous for his researches on electrons, and for discovering the cosmic rays. Professor of Physics at Chicago University 1910–21, and Director of the Norman Bridge Laboratory of Physics at Pasadena, California 1921–45. Awarded Nobel Prize for Physics, 1923.

Milne, Alan Alexander (b. 1882), English humorist, poet, and playwright who has written much delightful verse and stories for children.

Milner, Alfred, Viscount (1854–1925), imperial statesman, who served in South Africa from 1897 to 1905 and had great influence on the history of that country. Was Secretary for War in 1918 and for the Colonies, 1919–21.

Miltiades (d. 489 B C.), one of the leaders of the Athenian army against the Persians at Marathon.

Milton, John (1608–74), England's greatest epic poet, whose *Paradise Lost* is the greatest poem of the kind in the language. The best known of his other poems are probably the *Ode on the Morning of Christ's Nativity*, *L'Allegro*, *Il Penseroso*, *Lycidas*, and the sonnet *On his Blindness*. In 1652 he became totally blind, and at his death was buried in St. Giles's Church, Cripplegate, London, a monument being erected to his memory in Westminster Abbey.

Minot, George Richards, M.D. (1885–1950), an eminent American doctor who became Prof. of Medicine at Harvard in 1928, and famous for his researches in the pathology of the blood, and for his discovery of the curative properties of liver in pernicious anæmia. Shared the Nobel Prize for Medicine, 1934

Mirabeau, Gabriel, Comte de (1749–91), one of the prominent figures of the French Revolution, and a famous orator

Mistral, Frédéric (1830–1914), French poet who spent his whole life in Provence and wrote many works of great lyrical beauty; founded the Félibrige society (*q.v.* Gen. Inf), completed *Lou Trésor dóu Félibrige* in 1886, a Provençal dictionary and encyclopædia of Provence. Awarded Nobel Prize for literature in 1904.

Mithridates (*circa* 132–63 B.C), was King of Pontus from 120–63 B C , and showed great capacity as a commander conquering a great part of Asia Minor and Greece

Moffat, James (1870–1944), Scottish divine who translated the Bible into modern English.

Mohammed (570–632), the founder of Islam, the religion of the Moslems, fled from Mecca to Medina in 622, from which date the Mohammedan era opens By his constant preaching and proclaiming of the one and only Deity Allah he gathered round him a small and loyal, hard-fighting band of followers and was able to return to Mecca eight years later, an acknowledged conqueror. The Sacred Book of Islam, the *Koran*—though presented by him as an original revelation from the Angel Gabriel—may in the main be traced to Biblical and Rabbinical sources (*See* **Islam, Section J.**)

Moiseiwitsch, Benno, C B E (1890–1963), Russian-born, naturalised British pianist, especially well known for his rendering of the works of the Romantics.

Molière (Jean Baptiste Poquelin) (1622–73), the greatest of French comic dramatists, who, from being a poor strolling player, became the leading dramatist of his time. His greatest comedies were *Le Tartufe*, *Le Misanthrope*, *Le Malade imaginaire* and *Le Médecin malgré lui*.

Molotov, Vyacheslav Mikhailovitch (Skryabin) (b. 1890), Russian diplomat, succeeded Litvinov as Commissar for Foreign Affairs, 1939–49. Chief representative of the Soviet Union at numerous post-war conferences. For. Min., 1953–56. Since 1956 has served as Min. of State Control, Ambassador to Outer Mongolia, and Perm. representative of Soviet Union at U N. Int Atomic Energy Agency in Vienna

Moltke, Field-Marshal Count Helmuth von (1800–91), was responsible for the Prussian strategy in the Danish, Austrian, and Franco-Prussian wars, in all of which he was outstandingly successful.

Mond, Ludwig, Ph D , F.R.S. (1839–1909), German chemist who in 1867 settled in England as an alkali manufacturer and in partnership with John Brunner successfully manufactured soda by the Solvay process.

Monet, Claude (1840–1926), the most representative of the French Impressionists. Exhibited in 1874 his landscape *Impression Soleil levant*, from which the word *Impressionism* was derived.

Monier-Williams, Sir Monier, K.C.I E., LL.D., Ph.D. (1819–99), a great Sanskrit scholar who laboured with distinction in bringing westward the wisdom of the Orient.

Monk, George, 1st Duke of Albemarle (1608–69), served with distinction as general and admiral, particularly in the Anglo-Dutch wars, and in 1660 effected the Restoration of Charles II.

Monroe, James (1758–1831), Fifth President of the U S. Was appointed Governor of Virginia in 1799, and in 1803 went to France and carried through the purchase of Louisiana. Best known

as the author of the Monroe Doctrine, which he outlined in his Presidential message of 1823.

Montaigne, Michel de (1533–92), a French essayist of world-wide celebrity, who may be regarded as the inventor of the essay form, and had a great influence on English writers.

Montcalm, General Louis Joseph, Marquis de (1712–59), commander of the French Army against the British in Canada in the final struggle for possession. Defeated by Wolfe in 1759 and mortally wounded.

Montesquieu, Charles Louis de Secondat, Baron de La Brède et de (1689–1755), French philosopher and author. His works include *Les Lettres Persanes*, a witty satire on contemporary life, and his great work *L'Esprit des Lois*, setting out his ideas on politics and law. Showed a genius for generalisation and gave to history a philosophy. Greatly admired England and her constitution, which he misunderstood, and his influence on the authors of the American constitution consequently led to the impractical separation of the executive (the President) from the law-making power (Congress).

Montessori, Maria (1869–1952), educationist, whose methods for infant teaching have wide recognition *See* **J14**(2)

Monteverdi, Claudio (1567–1643), an Italian composer of importance by reason of his pioneer work in the operatic form. His most important dramatic work was *Orfeo* (1608).

Montezuma II. (1466–1520) was Emperor of Mexico when Cortes invaded that country, and the last Aztec ruler of Mexico

Montfort, Simon de, Earl of Leicester (1206–65), was a powerful baron, with liberal views, and a hatred of kingly tyranny. It was his bold action that forced Henry III., his brother-in-law, to grant the first English Parliament. He met his death at the Battle of Evesham.

Montgolfier, Joseph Michel (1740–1810) and **Jacques Etienne** (1745–1799), two French brothers who, during the last twenty years of the 18th century, demonstrated the practicability of a balloon inflated by heated air, making many ascents, and may be said to be the father of modern aeronautics.

Montgomery, Field-Marshal Viscount, K.G., G.C.B., D S.O (b. 1887), rose to military fame as Commander of the 8th Army in the North African and Italian campaigns, 1942–44. C.-in-C. British Forces in France and Germany, 1944–46; C.I G S., 1946–48 Permanent Military Chairman of the Western Union Defence Committee, 1948–51; Deputy Supreme Allied Commander Europe (NATO), 1951–58. Retired 1958. His *Memoirs* were published in 1958

Montrose, James Graham, Marquess of (1612–50), brave and inspiring Scottish general who raised the Highland clansmen for Charles I. and again for Charles II. His lyric poetry included *My dear and only love.*

Moody, Dwight Lyman (1837–99), the American revivalist preacher, associated for many years in mission work on both sides of the Atlantic with Ira D. Sankey, the "American Singing Pilgrim."

Moore, George (1852–1933), a well-known Irish novelist; author of *Confessions of a Young Man*, *Esther Waters*, *Evelyn Innes*, etc.

Moore, Henry, C H. (b. 1898), English sculptor, examples of whose work are to be seen in the Tate Gallery, the V. and A. Museum, and St. Matthew's Church, Northampton.

Moore, Sir John (1761–1809), British general, who trained the infantry for the Spanish Peninsular campaigns and conducted a brilliant retreat to Corunna, where he was mortally wounded after defeating the French under Soult

Moore, Thomas (1779–1852), Ireland's greatest poet, the author of *Irish Melodies*, *Lalla Rookh*, *The Epicurean*, and many other works. He enjoyed immense popularity both in England and Ireland. Friend and biographer of Byron.

More, Sir Thomas (1478–1535), succeeded Wolsey as Lord Chancellor under Henry VIII., but fell into disgrace by refusing to take the oath of Supremacy, and was ultimately executed. His *Utopia* (*see* **J43**) is one of the world's most noted books. Canonised in 1935 along with John Fisher, Bishop of Rochester, who was similarly martyred by Henry VIII.

Morgan, Sir Henry (*c.* 1635–88), Welsh buccaneer of great skill and daring; operated in the Caribbean against the Spaniards, capturing and plundering Panama in 1671. Knighted by Charles II. and made Deputy-governor of Jamaica.

Morgan, John Pierpont (1837–1913), one of the great financiers of his time who built the family fortunes into a vast industrial empire.

Morland, George (1763–1804), a painter of English rural life.

Morley, John, Viscount, O.M. (1838–1923), Liberal statesman and author, served as Secretary for Ireland in 1886 and 1892–95, and for India, 1905–10. Biographer of Gladstone, Voltaire, Rousseau, Burke, Walpole, Cromwell, and Cobden.

Morley, Thomas (*c.* 1557–1603), English Elizabethan composer of madrigals, noted also for his settings of some of Shakespeare's songs He was a pupil of Byrd, organist of St Paul's Cathedral, and wrote an important theoretical work *Plaine and Easie Introduction to Practicall Music* (1597).

Morris, William (1834–96), poet and craftsman. His hatred of 19th-cent. ugliness, his belief in human equality, and in freedom and happiness for all, conspired to make him a socialist, and he accomplished much for the improvement of domestic decoration He was a popular lecturer, founded the Socialist League and the Kelmscott Press. *See* **Arts and Crafts Movement, L9**

Morrison of Lambeth, Herbert Stanley, Baron, P.C., C H. (b. 1888), entered Parliament as Labour M P. for South Hackney in 1923. Leader of the L.C C. 1933–40. Dep. Prime Min. and Leader of the House of Commons in the Labour administration, 1945–51. Life peerage conferred, 1959.

Morse, Samuel Finley Breese (1791–1872), an American artist and designer, who became the inventor of the Morse system of electric telegraphs, and of the Morse code of signals

Moseley, Henry Gwyn-Jeffreys (1887–1915), lecturer in physics under Rutherford at Manchester Univ., 1910–12 Made great contributions to the theory of the structure of the atom. Killed at Gallipoli.

Mountbatten of Burma, 1st Earl, Admiral of the Fleet, P C , K G , G C.B , G C V O , D S O. (b 1900), naval officer and statesman. Chief of Combined Operations, 1942–43, Supreme Allied Commdr S E Asia, 1943–46, Viceroy of India, Mar–Aug. 1947 and first Gov. Gen of Dominion of India, Aug 1947–June 1948 Resuming his naval career in 1948 he has served successively as Flag Officer Commanding the 1st Cruiser Squadron, Mediterranean, Fourth Sea Lord, C.-in-C Mediterranean, C.-in-C. Allied Forces, Mediterranean, and First Sea Lord and Chief of Naval Staff, 1955–59, Chief of the Defence Staff, 1959

Mountevans, Admiral Lord, K C B , D S O (1881–1957), "Evans of the Broke," British sailor and explorer. Author of *South with Scott*

Mussorgsky, Modest Petrovich (1839–81), Russian composer whose masterpiece is the opera *Boris Godunov* after the play by Pushkin. His piano suite *Pictures at an Exhibition* was orchestrated by Ravel

Mozart, Wolfgang Amadeus (1756–91). The composer who bears this immortal name is universally acknowledged as the world's greatest musical genius. He was born at Salzburg, began his musical career at the age of four, toured the European courts as an infant prodigy, left the service of the Archbishop of Salzburg in his twenty-sixth year to live in Vienna, where his friendship with Haydn began and where his greatest music was written. Mozart's genius lies in the effortless outpouring of all forms of music, in the ever-flowing melodies, in the consistent beauty and symmetry of his compositions, and in the exactness of his method. Among the loveliest and grandest works in instrumental music are his three great symphonies in E flat, in G minor, and in C (called the "Jupiter"), all written in six weeks in 1788. Three of the greatest operas in musical history are his *Marriage of Figaro* (1786), *Don Giovanni* (1787), and *The Magic Flute* (1791). His last composition, written under the shadow of death, was the Requiem Mass, a work of tragic beauty.

Müller, Ferdinand von, Baron (1825–96), German botanist and explorer. Director of the Botanical Gardens at Melbourne, 1857–73. Intro-

duced the eucalyptus into the south of Europe and other regions, and took leading part in promoting Australian exploration.

Mumford, Lewis (b 1895), American social historian and authority on town planning and urban culture. His major work is the trilogy *Techniques and Civilization* (1934), *The Culture of Cities* (1938), *The Condition of Man* (1944)

Munkacsy, Michael von (1844–1900), a celebrated Hungarian painter of historical subjects.

Munnings, Sir Alfred James, K.C.V.O. (1878–1959). British painter whose country scenes and pictures of horses have gained him worldwide fame. P.R.A., 1944–49.

Murdock, William (1754–1839), engineer and inventor, one of the first to introduce gas lighting

Murillo, Bartolomé Esteban (1617–82), one of the greatest Spanish painters. His chief works are altar-pieces and religious subjects.

Murray, (George) Gilbert (Aime), O M , D Litt., D C L., LL.D. (1866–1957), classical scholar and humanist whose verse translations of Euripides are known throughout the world Became Professor of Greek at Glasgow at early age of 23; Regius Professor of Greek at Oxford, 1908–36; Chair. League of Nations Union, 1923–38; Pres. U.N. Ass. until his death.

Mussolini, Benito (1883–1945), Fascist dictator of Italy, 1922–43 From 1935 an aggressive foreign policy in Abyssinia, Spain, etc , was at first successful, and in June 1940, he entered the second world war on the side of Germany. The defeat of Italian arms in North Africa and the invasion of Sicily caused the collapse of his Government, but he was rescued from imprisonment by parachutists. Executed two years later by partisans.

N

Nansen, Fridtjof, G C V O., D Sc , F R G S (1861–1930), the Norwegian explorer who, after two or three expeditions across Greenland, in 1893 started out on his famous North Polar expedition when he reached the highest latitude until then attained—86° 14′—a feat later eclipsed by the Duke of the Abruzzi and by Peary, as well as by airship or aeroplane. He published a fascinating narrative of his exploration under the title of *Farthest North*. Active in Russian famine relief, 1921. Awarded Nobel Prize for Peace, 1922

Napier, John (1550–1617), mathematician, who made important contribution to the advance of astronomy and other branches of science by his invention of logarithms (published 1614)

Napoleon I. (Bonaparte) (1769–1821) was born at Ajaccio in Corsica Sent to France to receive a military education and was a captain at the age of twenty. In 1794 served in Italy with such distinction that he won a generalship, and next year was appointed Commander-in-Chief. A series of most brilliant successes followed. He defeated the Austrian forces in 1797, conducted an expedition to Syria and Egypt in 1798, returned in 1799 to find himself the most popular man in France, and in November of that year he proclaimed himself First Consul In 1800 he was again in Italy and once more victorious. In 1804 he was made Emperor, and the following year was in the field against England, Russia, and Austria, achieving a splendid series of victories at Austerlitz and elsewhere, and practically became Dictator of Europe, distributing kingships amongst his brothers in the most profuse manner, Joseph becoming King of Naples, Louis King of Holland, and Jerome King of Westphalia His invasion of Russia was disastrous, the Peninsular War went against him, and in 1814 the Allies entered Paris and forced him to abdicate. He was sent to Elba, but made his escape in the following year, gathered his old army about him and went forth to meet the English and Prussian armies. He was finally defeated at Waterloo on 18 June 1815, and held in captivity on the lonely island of St. Helena, where he died His remains were removed to Paris in 1840, and rest in a magnificent tomb. Recent evidence suggests that he may have been murdered by arsenic poisoning

Napoleon II. (1811–32) was the son of Napoleon I. and Maria Louisa. Was born in Paris and proclaimed King of Rome, but died of consumption when only twenty-one, being known at the time of his demise as the Duke of Reichstadt.

Napoleon III. (1808–73) was the son of Louis Bonaparte, King of Holland, and of Hortense, daughter of the Empress Josephine. After unsuccessful attempts to secure the French throne and years of imprisonment he took advantage of the revolution of 1848 to return to France and, following the famous *coup d'état* of December 2, 1851, emerged as master of France and was proclaimed Emperor the following year Married Eugénie de Montijo in 1853. Dictatorial and discredited at home, unsuccessful in his foreign adventures, his surrender at Sedan in the Franco-Prussian war of 1870 brought ruin to the Second Empire, and France once again became a republic Louis Napoleon took refuge in England and died at Chislehurst in Kent.

Nash, John (1752–1835), architect. Planned Regent Street, laid out Regent's Park, enlarged Buckingham Palace, and designed Marble Arch and the Brighton Pavilion

Nash, Paul (1889–1946), distinguished English painter and designer Official war artist in both world wars Best known pictures *The Menin Road* of 1918 and *Totes Meer* of 1941

Nash Rt Hon Walter (b 1882), New Zealand Labour politician, Prime Min , 1957–60. Resigned party leadership 1963.

Nasmyth, James (1808 90), the inventor of the steam-hammer, which became indispensable in all large iron and engineering works.

Nasir (Nasser) Col. Gamal Abd al- (b. 1918), first President of the first Egyptian Republic and influential leader of the Arab world Fought in Palestine War of 1948–49 and organised the military *coup* of July 23, 1952, which brought the abdication of King Farouk. His two most important actions have been the nationalisation of the Suez Canal and the building, with Russian help and finance, of the Aswan High Dam.

Nehru, Pandit Jawaharlal (b 1889), Indian statesman and one of the world's great leaders; Prime Min and Min of Foreign Affairs since 1947. Educated at Harrow and Cambridge where he studied science and law A leading member of the Congress Party for many years, during which he was frequently imprisoned for his political activities Played distinguished part in the final negotiations for the independence of India Since 1947 under his inspiring leadership India has made dramatic technical, industrial, and social advances.

Papin, Denis (1647–1714), a French mathematician and scientist who settled in England. He invented the condensing pump, and was a pioneer in the development of the steam engine. Not being a mechanic, he made all his experiments by means of models.

Paracelsus, Philippus Aureolus (1493–1541), a famous Swiss mystic and alchemist. He made numerous important discoveries, being the first to employ laudanum and antimony in pharmacy. The English translation of his *One Hundred and Fourteen Experiments and Cures* appeared in 1596. His real name was Theophrastus Bombastus von Hohenheim.

Park Mungo (1771–1806), famous British traveller who in 1799 published an arresting account of his *Travels in the Interior of Africa.*

Parker, Rev. Joseph (1830–1902), a popular Nonconformist preacher and author who built the City Temple, and ministered there up to the time of his death.

Parnell, Charles Stewart (1846–91), the Irish politician, who as leader of the Nationalist Party made it more powerful than it had ever been and successfully enlisted the support of Gladstone for the policy of Home Rule Accused by *The Times* of complicity in the crimes of the Land League on the basis of letters forged by Richard Pigott, he was completely vindicated by a Royal Commission and awarded heavy damages. Was dropped from the leadership of his party following the O'Shea divorce proceedings and died soon afterwards

Parry, Rear-Admiral Sir William Edward (1790–1855), an Arctic explorer and naval commander of great distinction, who undertook several expeditions to the Polar regions and made numerous important discoveries.

Parsons, Hon. Sir Charles Algernon, O.M., K.C.B., F.R.S. (1854–1931), was head of the electrical and engineering works of C. A. Parsons and Co., and of the Parsons Marine Steam Turbine Co., Ltd., Newcastle-on-Tyne, and inventor of the steam turbine which has effected a remarkable improvement in the propulsion of war and mercantile vessels.

Partridge, Sir Bernard (1861–1945), began life as a stained glass designer, afterwards worked at book illustrations, and for a time was on the stage. Joined *Punch* staff 1891, and for many years was its principal cartoonist.

Pascal, Blaise (1623–62), celebrated French mathematical genius and religious philosopher whose *Provincial Letters* are one of the world's literary masterpieces. At the age of nineteen he invented an ingenious adding machine and was the first to demonstrate the barometric effects of altitude.

Pasternak, Boris Leonidovich (1890–1960), Russian poet and writer. Translations of his great novel *Dr. Zhivago* appeared in 1958, though it was forbidden in the Soviet Union. In that year he was awarded—though he declined it—the Nobel Prize for Literature "for his important contributions both to contemporary lyric poetry and to the great Russian narrative tradition."

Pasteur, Louis (1822–95), French chemist, whose work was inspired by an interest in the chemistry of life which abided with him until his death. His researches on fermentation led to the science of bacteriology and his investigations into infectious diseases and their prevention to the science of immunology. The pathological bacteriological import of Pasteur's researches came about mainly through his disciples (Lister, Roux, and others) and not directly, though all founded on his early non-medical investigations on organisms of fermentation, etc., which were of great importance in industry, and fundamentally. He spent most of his life as administrator and director of scientific studies at the Ecole Normale at Paris, where he was appointed in 1857. The Institut Pasteur was founded in 1888.

Patmore, Coventry (1823–96), poet of the Victorian era, and author of *The Angel in the House*

Paton, Sir (Joseph) Noel, R S A., LL D. (1821–1901), sculptor, historical artist, archæologist, and poet.

Patrick, St. (*c.* 387–*c.* 463), the patron saint and Apostle of Ireland, was for many years a great and successful Christian missionary in that country. Few authentic facts about his life are known, but many miraculous stories, such as his alleged extermination of serpents in the island, have been associated with him.

Patti, Adelina Juana Maria (Baroness Cederström) (1843–1919), Italian soprano singer, was born in Madrid Her marvellous voice and brilliant execution made her immediately famous.

Pattison, Dorothy Wyndlow (1832–78), a sister of Mark Pattison, who devoted a great part of her life to hospital work in Walsall, where, as "Sister Dora," she is revered for her saintly life and devotion to the sick poor

Pattison, Mark (1813–84), scholar and critic, rector of Lincoln College, Oxford. His wife was **Emilia Francis Strong** (afterwards Lady Dilke), well known as a French art historian and for her work in promoting trade unionism among women workers.

Pavlov, Prof. Ivan Petrovich (1849–1936), an eminent Russian physiologist· Director of the Physiological Institute. Foreign member of the Royal Society and Nobel Prize-winner.

Pavlova, Anna (1885–1931), one of the greatest exponents of the Russian school of dancing.

Peabody, George (1795–1869), an American merchant who lived for the greater part of his life in London, and, acquiring a large fortune, bequeathed immense sums for philanthropic purposes in England and the United States

Peacock, Thomas Love (1785–1866), English satirist, whose novels include *Headlong Hall* and *Nightmare Abbey*, and who ranks high in English literature for the wit and grace of his style.

Pearson, Sir Cyril Arthur, Bt. (1866–1921), journalist and newspaper proprietor, who founded *Pearson's Weekly*, *The Daily Express*, and other publications. Later retired from business because of blindness and devoted himself to the welfare of other blind people, particularly ex-servicemen, being the founder of St. Dunstan's.

Pearson, Lester Bowles, O.B E., M A. (b. 1897), Canadian Minister for External Affairs, 1948–57. Awarded 1957 Nobel Peace Prize.

Peary, Rear-Admiral Robert Edwin (1856–1920), an American Arctic explorer who, in 1891–92, conducted a sledging expedition towards the Pole. In 1893, 1895, and 1898 was again in the Arctic regions, and in 1900–02 reached the highest latitude hitherto attained. In the spring of 1906 he touched 87 degs 6 min. N latitude. On April 6, 1909, making the journey by sledge over sea-ice and accompanied by only his native servant, he succeeded in reaching the Pole.

Peel, Rt. Hon. Sir Robert, 2nd Bt. (1788–1850), a prominent British statesman who entered Parliament at twenty-one years of age, and immediately exhibited great capacity, being appointed Under-Secretary for the Colonies in the following year. From 1812 to 1818 he was Secretary for Ireland; and in 1822 he became Home Secretary, introducing, whilst fulfilling that office, the new police service associated with his name. In 1834, Peel was for four months Prime Minister,

and in 1841 formed a second ministry. It was then that the Anti-Corn Law agitation became formidable, and Peel abandoned his former Protectionist attitude, and carried his Repeal measure eventually in 1846. He was thrown from his horse in Hyde Park on June 25th, 1850, and died from injuries.

Penfield, Wilder Graves, O.M., M.D., M.A., D.Sc., F.R.S. (b 1891), Canadian brain surgeon; Dir. Montreal Neurological Institute; Prof. of Neurosurgery McGill Univ; Pub. *The Cerebral Cortex of Man* (1950), *Epilepsy and the Functional Anatomy of the Human Brain* (1954).

Penn, William (1644–1718), became a Quaker, and wrote some powerful pamphlets supporting his new faith. He devoted himself to good works, and in 1682, having obtained a special grant from King Charles II., went to America and founded Pennsylvania.

Penney, Sir William George, K.B.E., M.A., Ph.D., D.Sc., F.R.S. (b. 1909), British scientist; Dep. Chair. U.K. Atomic Energy Authority, 1961– , succeeded Sir John Cockroft as Member (Scientific Research) in 1959, formerly Dir Weapons Group, Atomic Weapons Research Estab., Aldermaston.

Pepys, Samuel, F.R.S. (1633–1703), naval administrator, sometimes called the "Father of the British Civil Service." The *Diary* was written while he was a comparatively young man and is a unique revelation of a man and his age, besides including eye-witness descriptions of the Great Plague and Fire of London.

Pergolesi, Giovanni Battista (1710–36), Italian composer, best known for his humorous opera *La Serva Padrona* and his *Stabat Mater*

Pericles (*c* 490–429 B.C.), the distinguished Athenian statesman, general, and orator, who raised Athens to the point of its fullest prosperity

Perkin, Sir William Henry, F.R.S., D.Sc. (1838–1907), great organic chemist and famous for his discovery of mauve, the first synthetic dye.

Perkin, William Henry (junior) (1860–1929), foremost organic chemist of his day; Professor of Organic Chemistry at Manchester University, 1892–1912 and later at Oxford His researches led to important industrial results.

Perrin, Francis (b 1901), French scientist and socialist, succeeded Joliot-Curie as High Commr for Atomic Energy in 1951 Prof Atomic Physics, Collège de France, 1946–

Persius Flaccus, Aulus (A.D. 34–62), a famous Stoic philosopher

Perugino, Pietro (1446–1524), Italian artist who excelled in religious subjects and painted many fine frescoes including some in the Sistine Chapel at Rome Raphael was his pupil

Pestalozzi, Johann Heinrich (1746–1827), Swiss educational reformer whose theories laid the foundation of modern primary education His teaching methods were far in advance of his time, but are now employed with outstanding success in schools in many parts of the world

Pétain, Marshal Henri Phillipe (1856–1951), became a French national hero after the successful defence of Verdun in 1916 and was made C.-in-C. of all the French armies. In 1940 he became Prime Minister, signed an armistice with Germany, and set up a quasi-independent administration at Vichy. In 1945 he was sentenced to death for treason, the sentence being commuted to life imprisonment.

Peter I, called **The Great** (1672–1725). Czar of Russia, showed great ability and energy of character, devoting himself largely to the reorganisation of his army and navy He spent some months at Deptford studying shipbuilding He founded St. Petersburg (1703), which was his "window on to Europe," and gained control in the war with Sweden of Karelia, Ingermanland, and Livonia. Among the prisoners taken by him at the Battle of Poltava (1709) was Catherine Skavronsky, daughter of a Lithuanian peasant, whom he later married. By her care and understanding she did much to strengthen his power. Peter died without naming an heir, and Catherine became Empress of Russia (1725–27).

Peter, the Hermit (*c.* 1050–1115), was the main instrument of the agitation which brought about the first Crusade. He was a French monk, of great eloquence and earnestness, and lived to see Jerusalem in the hands of the Christians.

Petrarch, Francesco (1304–74), Italian poet and scholar, whose odes and sonnets *To Laura* are unmatched for their lyrical beauty and passion.

Petrie, Sir (William Matthew) Flinders, F.R.S. (1853–1942), British egyptologist; carried out excavations in Britain (1875–90), Egypt (1880–1924), and Palestine (1927–38); Prof of Egyptology at University College, London, 1893–1935.

Phidias, the greatest of Greek sculptors, flourished from about 500 to 432 B.C., was specially famous for his work in gold, ivory and bronze. Nothing now remains to attest his genius although the sculptures in the British Museum, widely known as the Elgin Marbles, may have been from his designs

Philip II. of France (1180–1223), was a prominent figure in the third Crusade, in which for a time he associated himself with our Richard I. Victor over a strong coalition at the momentous battle of Bouvines in 1214.

Philip II. of Macedonia (382–336 B.C.), trained in military arts in Greece, when he came to the throne instilled martial ideas into his subjects, and entered upon a career of conquest that did not end until he had become master of Greece. Father of Alexander the Great.

Philip II. of Spain (1527–98), succeeded his father the Emperor Charles V. in half his dominions. The Revolt of the Netherlands, the annexation of Portugal in 1580, and the unsuccessful attempt to subdue England by the Armada, were outstanding events of his troubled reign. He was a devout Roman Catholic, strongly supported the Counter-Reformation, built the strange Escorial and was four times married, his second wife being Mary Tudor

Philip V. of Spain (1683–1746), founded the Bourbon dynasty in Spain, and was the son of the Dauphin of Louis XIV. and Maria Theresa of Spain His uncle, Charles II. of Spain, bequeathed the kingdom to him, and this led to the war of the Spanish Succession, which ultimately confirmed him in his kingship.

Phillip, Arthur (1738–1814), first governor of New South Wales. Under his command the first fleet of 717 convicts set sail from Britain to Australia, and with the founding of Sydney in 1788 colonisation of the whole country began.

Phillips, Stephen (1868–1915), dramatist and poet of distinction. Wrote popular verse dramas, including *Paolo and Francesca*, *Herod*, and *Ulysses*

Piasts, first Polish dynasty in Poland until 14th century and until 17th century in Silesia.

Piazzi, Giuseppe (1746–1826), an Italian astronomer. He was the discoverer of the planet Ceres, the first known of the asteroids.

Picasso, Pablo Ruiz (b 1881), Spanish painter who received his early training in Catalonia and settled in Paris in 1903. His influence over contemporary art is comparable with that exercised by Cézanne (*q v*) over the artists of his time. His work is to be found in public galleries and private collections all over the world and is represented by *Femme Nue dans un Fauteuil Rouge* in the Tate Gallery. His genius has also found scope in sculpture and etchings and he has designed décor costumes for the ballet.

Piccard, Auguste (1884–1962), Swiss physicist, noted for his stratosphere ascents in a specially constructed balloon, 1931–32, and for his submarine research In Jan 1960 his son, Dr Jacques Piccard, made a descent of over 7 miles in the Marianas trench in the western Pacific in a bathyscaphe designed and built by him.

Pickford, Mary (b 1893), was the leading film actress of the silent days and affectionately known as "the world's sweetheart."

Pilsudski, Joseph (1867–1935), Polish soldier and statesman. Led unsuccessful Polish attack on Russia in 1920 seeking the restoration of the 1772 frontiers. Exercised military dictatorship from 1926 until his death.

Pindar (522–443 B.C.), the eminent lyric poet of ancient Greece

Pinero, Sir Arthur Wing (1855–1934), was an able English dramatist and former actor, of Portuguese descent. *Dandy Dick*, *The Second Mrs. Tanqueray* and *Mid-Channel* are among his plays.

Pirandello, Luigi (1867–1936), was a prominent Italian dramatist and novelist, many of whose works have been translated into English. Awarded Nobel Prize for Literature, 1934.

Pissarro, Camille (1830–1903), French Impressionist painter of landscapes; studied under Corot.

Pitman, Sir Isaac (1813–97), founded the Pitman system of phonographic shorthand.

Pitt, William (1759–1806), was the second son of the Earl of Chatham. Entered Parliament at twenty-one, and by his brilliant oratory captivated the House of Commons. In 1782, when only twenty-three, he became Chancellor of the Exchequer, and in the following year was made Premier, and held that office for seventeen years, through the trying period of the French Revolution, when war with France was almost continuous. He was undoubtedly one of the most brilliant statesmen that England has produced, and his death at the early age of forty-six was a great loss to the country. He was buried in Westminster Abbey.

Pius XII. (1876–1958), elected Pope, March 2, 1939. As Cardinal Eugenio Pacelli, he was Papal Secretary of State, 1930–39, and was outspoken in his condemnation of those aspects of the policy of the totalitarian states which he considered anti-Christian Before he became a Cardinal he was for many years Papal Nuncic in Germany.

Pizarro, Francisco (*c.* 1478–1541), was an adventurous Spaniard who, after Columbus's discoveries in the New World, set out for South America, overthrowing the Inca empire and conquering Peru for the Emperor Charles V.

Planck, Prof. Dr. Max (1858–1947), German physicist, whose investigations into radiation of energy culminated in 1901 in his law of radiation, which laid the foundation of the quantum theory. Awarded Nobel Prize for Physics, 1918.

Plato (427–347 B.C), great Athenian philosopher, pupil of Socrates, teacher of Aristotle He founded a school at Athens under the name of the Academy, where he taught philosophy and mathematics. His great work is his *Dialogues*, which includes the *Republic*, the longest and most celebrated of them all. All Plato's known writings have come down to us, and they constitute one of the most influential bodies of work in history.

Plimsoll, Samuel (1824–98), was a native of Bristol, and while M.P for Derby got up an agitation on behalf of merchant sailors, procuring the passing of the Merchant Shipping Act of 1876, which by defining a line above which no ship must sink in the water when loaded has ever since made the overloading of ships illegal. The line is known as the Plimsoll Mark

Pliny: Pliny the elder was a naturalist of high reputation; Pliny the younger, his nephew, achieved renown by a series of historical *Letters* and died A.D. 113.

Plotinus (*c.* 204–270), Greek philosopher, was the founder of Neoplatonism, which had considerable influence on early Christian thought

Plutarch (*c.* 46–120), a pagan Hellenic writer, a contemporary of the authors of the two gospels according to St. Matthew and St. Luke. His *Lives of Agis and Cleomenes* form one of the world's most famous literary productions.

Poe, Edgar Allan (1809–49), was an American poet of unique genius, author of " The Raven," " The Bells," " Annabel Lee," and other poems of haunting melody and dainty fancy. Poe's *Tales of Mystery* are thrilling examples of their class

Poincaré, Raymond Nicolas Landry (1860–1934), was President of France from 1913 to 1920 and won the confidence and admiration of the French people and their Allies by his services during the first world war. He was Prime Minister in 1912, 1922–24, and 1926–29

Pole, Reginald (1550–58), archbishop of Canterbury (1556–58), cardinal of the Roman Church, antagonist of the English reformation, whose mother was Margaret Plantagenet, half-sister of Henry VII's mother His difference with Henry VIII over the divorce of Catherine evoked his famous treatise *De Unitate Ecclesiastica*, a defence of papal supremacy and a denunciation of the king. His activity brought about his own attainder, and the execution of his brother and mother as participators in his treasonable designs.

Pollard, Professor Albert Frederick, F.B.A. (1869–1948), English historian and first director of the Institute of Historical Research; author of many authoritative works on the Tudor period.

Polo, Marco (1256–1323), the famous Venetian traveller and explorer, who made journeys through China, India, and other eastern countries, and published the record of his various wanderings, recounting the many wonders and marvels he had seen—a record which seemed for the most part beyond credence to his contemporaries, but now largely confirmed

Pompadour, Jeanne Antoine Poisson, Marquise de, otherwise known as Madame de Pompadour (1721–64), was for a long time the favourite of Louis XV. of France, over whom she exercised great influence.

Pompey the Great (106–48 B.C.), distinguished himself as a general while young, clearing the Mediterranean of pirates, and ultimately became, with Caesar and Crassus, triumvir.

Pope, Alexander (1688–1744), the celebrated 18th century poet and translator of *Homer*. Author of *The Rape of the Lock*, *Essay on Criticism*, and *Essay on Man*.

Pound, Ezra Loomis (b. 1885). American poet and scholar, famous both for the beauty of his individual verse and for his excellent translations of Provencal, Latin, Chinese, French and Italian poets. Treason charges brought in 1945 against the poet were quashed in 1958 when he was released from the Federal mental hospital where he had been kept He returned to Italy to live.

Poussin, Nicolas (1593–1665), an eminent French painter patronised by Louis XIII.

Prasad, Dr. Rajendra (1884–1963), first President of the Indian Union, 1950; re-elected in 1952 and 1957, retired 1962, succeeded by Dr. Radhakrishnan

Praxiteles, a great Greek sculptor who lived in the 4th century B.C.

Preece, Sir William Henry, K.C.B , F R S (1834–1913), a Welsh electrician, connected with the Electric Telegraph Service from 1853, and conspicuously successful in his experiments which led to the later developments in telegraphy. He was associated with Marconi in his wireless-telegraphic schemes and introduced the block system into England.

Prescott, William Hickling (1796–1859), one of the best known of American historians

Prichard, James Cowles, M.D , F.R S (1786–1848) British ethnologist and physician, whose knowledge of anatomy, psychology, and of languages enabled him to grasp the principle that people should be studied as a whole. He paved the way for future anthropological research

Priestley, John Boynton, M A (b 1894), novelist, playwright and broadcaster, whose work has received great praise and includes the novels *The Good Companions*, *Angel Pavement*, the plays *Dangerous Corner*, *Time and the Conways*, *The Linden Tree*, and a literary history, *Literature and Western Man* (1960)

Priestley, Joseph, F.R S (1733–1804), was the discoverer of oxygen and other gases, and wrote *A History of Electricity* He was also a great advocate of freedom and progress.

Priestley, Sir Raymond, M A , D.Sc. (b 1886), geologist. Took part in the Shackleton Antarctic Expedition of 1907–9 and Scott's Antarctic Expedition 1910–13. President of the British Association, 1956

Prior, Matthew (1664–1721), a well-known poet and wit who acquired celebrity by writing *The City Mouse and Country Mouse.*

Prokofiev, Serge Sergeyevich (1891–1953), celebrated Russian composer, whose music has a strong folk-song element, rich in melody and invention. He has written operas: *The Love of Three Oranges*, *The Betrothal in a Nunnery*, *War and Peace*, ballets: *Romeo and Juliet*, *Cinderella*, symphonies, chamber music and the music for Eisenstein's films *Alexander Nevsky*, *Ivan the Terrible*, etc.

Protagoras (*c.* 480–411 B.C.), a Greek philosopher, chief of the Sophists, famous for his scepticism and disbelief in objective truth.

Proudhon, Pierre Joseph (1809–65), a French political economist.

Proust, Marcel (1871–1922), French psychological novelist; author of a series of 15 novels known under the title of *A la Recherche du Temps Perdu*. Proust's works have been admirably translated into English by C. K. Scott Moncrieff.

Ptolemy, Claudius Ptolemaeus, a famous astro-

nomer and geographer of Alexandria, who flourished from c. A.D. 90–168. He founded the Ptolemaic system, which taught that the earth was stationary and the heavenly bodies revolved around it.

Puccini, Giacomo (1858–1924), Italian composer whose operas met with great success and include *Manon Lescaut*, *La Bohème*, *La Tosca*, *Madam Butterfly*, and *Turandot* (finished after his death).

Purcell, Henry (1658–95), one of the great figures in English music; organist of the Chapel Royal and composer to Charles II. Anthems form the greater part of his sacred music, and he wrote not only for the Court but for the stage.

Pusey, Edward Bouverie (1800–82), a famous Anglican cleric, he published *Tracts for the Times*, which inaugurated the Tractarian movement that developed into what became known as Puseyism.

Pushkin, Alexander (1799–1837), the national poet of Russia, several times exiled for his liberal views and held in high honour by contemporary Russia. Died of wounds received in a duel. His poetical tales are full of dramatic power. *Eugene Onegin* is generally considered his masterpiece and *Boris Godunov* is a fine tragedy.

Pym, John (1584–1643), a prominent statesman in the reign of Charles I. A leader of the Puritan opposition in Parliament.

Pythagoras (c 582–c. 507 B C.), most influential of the early Greek scientists He was born on the island of Samos, off the Turkish mainland, which he left c 530 to settle at Croton, a Greek city in southern Italy. He was a mystic and mathematician and believed in the transmigration of souls He died in exile His great works are the *Almagest* and his *Geographical Outline*

Q

Quaritch, Bernard (1819–99), a famous dealer in rare books, who was a native of Germany but settled in London, and became naturalised in 1847 His knowledge of scarce and valuable books was unique His shop in Piccadilly was a storehouse of literary treasures.

Quasimodo, Salvatore (b. 1901), Italian poet whose greatness lies in his humanity and his rejection of the Fascist influence. He won the Nobel Prize for Literature in 1959.

Quiller-Couch, Sir Arthur Thomas (1863–1944), was a well-known novelist and essayist, who as " Q " published many delightful stories, including *Dead Man's Rock*, *Troy Town*, and *The Splendid Spur*. Edited the *Oxford Book of English Verse*. Professor of English Literature, Cambridge University, 1912–44

R

Rabelais, François (c 1495–1553), the great French satirist, first adopted the career of a monk, then studied medicine, and settled at Lyons as a doctor, and it was there that he published his *Gargantua and Pantagruel*, among the wittiest though coarsest books in any language.

Rachel, Mlle (stage name of **Elizabeth Félix**) (1821–58), acknowledged as the greatest tragic actress of her time and reached the height of her fame in Racine's *Phèdre* in 1843.

Rachmaninov, Sergei Vasilyevich (1873–1943), Russian pianist, composer, and conductor. He wrote operas, symphonies, piano concertos, piano pieces, and songs, and was one of the greatest pianists of his age. After the Russian revolution he made his home in America, where he died.

Racine, Jean (1639–99), a distinguished French tragic dramatist, best known by his *Andromaque*, *Phèdre*, and *Athalie*.

Rackham, Arthur, R. W. S. (1867–1939), a noted English artist who excelled in the illustration of books such as *Peter Pan*, *Alice in Wonderland*, Wagner's *Ring Librettos*, *Mother Goose*, Grimm's and Andersen's *Fairy Tales*.

Radhakrishnan, Sir Sarvepalli, M A . D Litt (b 1888). Pres. Indian Union, 1962– . Vice-Pres., 1952–62; formerly Spalding Professor of Eastern Religions and Ethics at Oxford.

Raeburn, Sir Henry, R.A. (1756–1823), was a famous Scottish portrait painter, and friend and pupil of Sir Joshua Reynolds.

Raemakers, Louis (1869–1957), Dutch cartoonist, famous for his scathing satires on the Germans during the first world war. His *Cartoon History of the War* was published in 1919.

Raffles, Sir Thomas Stamford (1781–1826), an eminent naturalist. He was the founder and first President of the Zoological Society of London. Founded Singapore, 1819.

Raikes, Robert (1735–1811), a practical propounder of the Sunday School system.

Raleigh, Sir Walter (1552–1618), a scholar, courtier, soldier, sailor, and statesman. In 1584 Queen Elizabeth granted him a patent for the discovery and settlement of unknown countries in the far West. The colonisation of Virginia followed. At one time he was in great favour at Court, but quarrelled with the Queen, and suffered in fortune in consequence. When James I. came to the throne, Raleigh was supposed to be implicated in a conspiracy against that monarch, and was sentenced to death. After that he was a prisoner in the Tower of London for twelve years, and there he wrote his *History of the World*, and other works In 1615 James set him at liberty in order to head an expedition to Guiana in the hope of finding gold, but being unsuccessful he was again imprisoned on his return, and finally beheaded in Old Palace Yard.

Raleigh, Sir Walter, M.A. (1861–1922), Professor of English Literature at Oxford, and author of many volumes on eminent men of letters, including books on Milton, Wordsworth, and others His work on Shakespeare, 1907, is his highest achievement.

Raman, Sir (Chandrasekhara) Venkata, F R S. (b. 1888), Indian physicist whose main work has been in spectroscopy. For his research on the diffusion of light and for the discovery of the " Raman Effect " he was awarded the 1930 Nobel Prize in Physics.

Rameau, Jean Philippe (1683–1764), French composer and church organist whose *Treatise on Harmony*, 1722, and other works on musical theory profoundly influenced musical development in the 18th century.

Ramón y Cajal, Santiago (1852–1934), Spanish histologist who made many discoveries in the structure of the nervous system. Nobel Prizeman, 1906

Ramsay, Sir William, K.C.B , F R S. (1852–1916), chemist and discoverer with Lord Rayleigh of the hitherto unknown constituent of air, argon. Later discovered helium and detected other inert gases, which he called neon, krypton, and xenon With F Soddy carried out research on radium emanation Awarded Nobel Prize in Chemistry, 1904. President of the British Association, 1911.

Ramsey, Most Rev. Arthur Michael, D.D (b. 1904), Archbishop of Canterbury, 1961. Archbishop of York, 1956–61. Prof of Divinity at Cambridge, 1950–52. Lord Bishop of Durham, 1952–56

Ranke, Leopold von (1795–1886), the painstaking and thorough German historian who laid the basis of modern historical research and demonstrated many of its methods.

Raphael Santi (1483–1520), the distinguished Italian painter whose works excel all others in their beauty of expression and inspired treatment. He lived a considerable period in Rome, where he painted his famous frescoes for the Vatican and St. Peter's and also the celebrated cartoons designed for the tapestries of the Papal chapel, which afterwards were brought to England, and are now at the Victoria and Albert Museum. His last painting was *The Transfiguration* Examples of his work are to be found in most of the great European collections, including our own National Gallery.

Rasputin, Grigori Yefimovich (1871–1916), a " holy man " of the old Russia who lived quietly in his native village until 1904, when he became notorious for his extravagant teachings, which gave him a Messianic-like position. He was a debauchee and advocated sin in order to obtain repentance and salvation. In 1907 he was presented to the Court where he soon became all-powerful A seeming miracle which improved

the health of the Tsarevich Alexis increased his influence with the Tsar and Tsaritsa. Assassinated by a group of conspirators from the nobility.

Rathbone, Eleanor (1872–1946) social reformer, humanitarian, and independent politician. Championed widows' pensions and family allowances and laboured for political refugees, particularly children.

Ravel, Maurice (1875–1937), French composer, pupil of Fauré, one of the leaders of the impressionist movement. He wrote chiefly chamber music, piano pieces, songs, and ballet music, including *Daphnis et Chloé*, specially commissioned by Diaghilev.

Raven-Hill, Leonard (1867–1942), English artist and cartoonist, was well known for his drawings and cartoons in *Punch*, 1896–1935.

Rawlinson, Sir Henry Creswicke, Bt., G.C.B., F.R.S. (1810–95), diplomat, soldier and orientalist. For a number of years he superintended explorations in Assyria and Babylon, accumulating a valuable collection of antiquities now in the British Museum.

Ray, John (1627–1705), an English naturalist, famous for his contributions to the science of botany. He has been called the "father" of English natural history.

Rayleigh, 3rd Baron, O.M., F.R.S. (1842–1919), one of the most eminent of British physicists; an authority on sound vibrations, and the co-discoverer with Sir William Ramsay of argon. In 1904 was awarded the Nobel Prize for physics

Read, Sir Herbert, Kt D.S.O., M.C. (b. 1893), English poet and critic He was assistant keeper at the Victoria and Albert Museum (1922–31), professor of fine art at Edinburgh (1931–33), and edited the Burlington Magazine (1933–39). His writings include *Poems 1914–1934*, *In Retreat*, *Reason and Romanticism*, *Education through Art*, *The Meaning of Art*.

Reade, Charles (1814–84), holds high rank amongst the Victorian novelists. His first story, *Peg Woffington*, was published in 1852 *It's Never too Late to Mend*, *Griffith Gaunt*, and *The Cloister and the Hearth* are his best-known novels

Réamur, René Antoine Ferchault de (1683–1757), an eminent French chemist, who invented the thermometer which bears his name.

Récamier, Madame Jeanne Françoise Julie Adélaide Bernard (1777–1849), a noted society woman of the days of Napoleon.

Reeves, (John) Sims (1818–1900), was the most celebrated English tenor of his time.

Regnault, Henri Victor (1810–78), a French scientist who made highly successful experiments in regard to the physical properties of bodies and their relation to heat.

Regnault, Jean Baptiste, Baron (1754–1829), a talented French genre painter.

Reith, John Charles Walsham, 1st Baron (b. 1889), British civil engineer, the first Director-General of the British Broadcasting Corporation, 1927–38. Recognised as a man of great organising ability, he has served successively as Chairman of Imperial Airways (1938–39), Chairman of B.O.A.C. (1939–40), Min. of Information (Jan.–May 1940), Min of Transport (May–Oct. 1940), Min. of Works and Buildings (Oct 1940–Feb. 1942), Dir. of the Admiralty's Combined Operations Material Dept. (1943–45), Chairman Commonwealth Telecommunications Conference (1945), Chairman Commonwealth Communications Council (1946), and Chairman Colonial Development Corporation, 1950–59.

Rembrandt, Harmens van Rijn (1606–69), one of the greatest of the Dutch school of painters who produced many remarkably successful portraits, as well as numerous figure subjects, all of them distinguished by their masterly qualities. He was an etcher of high ability also, and a number of his works are in the British national collections.

Renan, Ernest (1823–92), a noted French author who wrote much upon religious subjects, and won special fame by his *Life of Jesus*, published 1863.

Reni, Guido. (*See* **Guido Reni.**)

Rennie, John, F.R.S. (1761–1821), a Scottish civil engineer. He was the constructor of the Waterloo and Southwark and new London bridges over the Thames, the London Docks, the East and West India Docks, the Plymouth breakwater, and many other works at Liverpool, Leith, Dublin, Hull, and elsewhere.

Renoir, Auguste (1841–1919), great French artist of the Impressionist school, whose vision was carefree and romantic. Some of his greatest achievements were in still-life and landscape. *La Loge*, *Les Parapluies*, *La Première Sortie*, *Grandes Baigneuses* are famous pictures.

Reuter, Baron Paul Julius de (1821–99), was the pioneer of telegraphic press services

Reymont, Vladislav Stanislav (1868–1925), Polish novelist; Nobel Prize 1924 (*The Peasants*).

Reynolds, Sir Joshua, P.R.A. (1723–92), was the first President of the R.A from 1768 till his death, and the most eminent English portrait painter of his time.

Rhodes Rt. Hon. Cecil John (1853–1902), born at Bishop's Stortford. Went to South Africa in 1871, entered upon a diamond-mining enterprise at Kimberley, and acquired a considerable fortune. Was a member of the Cape Legislature in 1881, and became Premier in 1890 He was at the head of the British South Africa Chartered Company, for which a vast amount of territory was annexed, the holding obtaining the name of Rhodesia. Mr. Rhodes was Cape Premier again in 1896, then followed the Jameson Raid and his retirement from political life. During the Boer War he was detained in Kimberley and did not live to see the campaign closed He left the bulk of his fortune for the founding of scholarships at Oxford.

Ricardo, David (1772–1823), a celebrated English political economist of Hebrew descent, whose *Principles of Political Economy* gained him a high place among the exponents of the science

Richard I. (1157–99) was King of England from 1189 to his death He laid heavy burdens upon the people in order to equip an army for the third Crusade. At first he was victorious and did such valiant deeds that he received the name of "Cœur de Lion." Being ultimately defeated, he signed a truce with Saladin, and on his way back to England was shipwrecked Disguised as a pilgrim, he was identified in Austria, and handed over to the Emperor of Germany, who imprisoned him in a remote castle A large sum was demanded and paid for his ransom, and after over a year of durance he returned to England, and was crowned at Winchester. Later he was engaged in a war with France, and was mortally wounded by a bolt from a crossbow while besieging the castle of Chaluz in the province of Limousin.

Richard II. (1367–1400), son of the "Black Prince," succeeded his grandfather, Edward III., in 1377, when but ten years old, a Regency being appointed during his minority. In the Wat Tyler rising of 1381 the King confronted the rioters and promised them redress, an undertaking which he did not fulfil. For a time he was greatly under the influence of his uncle, Thomas, Duke of Gloucester, but on coming of age dismissed him, and ruled with some approach to dignity for the next seven years. After 1396 he developed a highly tyrannical disposition and banished or put to death many of the leading statesmen. The opposition against him came to a head in 1399, when Bolingbroke defeated him, and he was made prisoner and died—probably by starvation—in Pontefract Castle

Richard III. (1452–85), last Plantagenet king of England who took the throne on the death of his brother Edward IV. in 1483, probably murdering his two younger nephews in the Tower This led to a rebellion in favour of the Earl of Richmond (later Henry VII) and he was slain on Bosworth Field His character has been the subject of dissension among historians but there is no doubt that despite his unscrupulousness (not uncommon in those days) he was a brave soldier and able administrator.

Richards, Sir Gordon (b 1904), British jockey who had one of the most successful riding records in the history of the British Turf: 21,834 mounts, 4870 winners, including the Derby (1953). Retired, 1954.

Richardson, Sir Albert Edward, K.C.V.O., P.R.A., F.S.A., F.R.I.B.A. (b. 1890), British architect and Pres. of the Royal Academy, 1954–56.

Richardson, Henry Handel, pseudonym of **Henrietta Richardson Robertson** (1870–1946), Aus-

tralian novelist whose major work, outstanding in Australian fiction, is the trilogy *The Fortunes of Richard Mahony*.

Richardson, Sir Owen Williams, D.Sc., F.R.S. (1879–1959), distinguished English physicist. Awarded Nobel Prize in 1928 for his researches on the emission of electricity from hot bodies.

Richardson, Sir Ralph David (b. 1902), actor who has made many appearances on stage, screen, and radio.

Richardson, Samuel (1689–1761), author of *Pamela*, *Clarissa*, and *The History of Sir Charles Grandison*, exercised considerable influence on the development of the novel in England.

Richelieu, Armand Jean du Plessis, Cardinal Duc de (1585–1642), the eminent French ecclesiast and statesman, who was Minister to Louis XIII for eighteen years. He was practically Master of France during the best part of this Cardinalate.

Ridley, Nicholas (1500–55), was Bishop of Rochester in 1547 and Bishop of London in 1550. He took an active part in the Reformation. He was burned at the stake along with Latimer.

Rienzi, Cola di (1313–54), a Roman patriot of humble birth who inflamed the people against their rulers, and aroused such enthusiasm that they proclaimed him "Tribune." During the seven months that he was permitted to exercise supreme power, he proved himself the true friend of the poor. Later murdered in a popular uprising.

Rilke, Rainer Maria (1872–1926), German lyric poet, born in Prague. His work, marked by great beauty of style, culminated in the *Duineser Elegien* and *Sonette an Orpheus*

Rimbaud, Jean Nicolas Arthur (1854–91), French poet of great originality and friend of Paul Verlaine. All his poems were written between his sixteenth and nineteenth years.

Rimsky-Korsakov, Nikolai Andreyevich (1844–1908), Russian composer whose works include the operas *The Maid of Pskov* (also known as *Ivan the Terrible*), *The Snow Maiden*, *Le Coq d'Or*, and the symphonic suite *Scheherezade* He was a brilliant orchestrator and rescored many works, including Borodin's *Prince Igor*.

Rizzio, David (c 1540–66), was the Italian secretary of Mary Queen of Scots and an accomplished musician. Suspected of a too great attachment to Mary, he was murdered by Darnley and his friends in the Queen's presence in the Palace of Holyrood.

Robbia, Luca Della (1400–1482), a famous Florentine sculptor He was the introducer of enamelled terra-cotta work.

Robens, Rt. Hon. Alfred, Baron (b. 1910), Chairman, National Coal Board, 1961– , Parl Sec Min of Fuel and Power, 1947–51, Min of Labour and National Service, 1951

Roberts, Field-Marshal Earl, V.C., K G , P C., K P , G C B , O M., G C S I., G C I E (1832–1914), the distinguished soldier, first saw service in the Indian Mutiny, when he won the V.C In 1880 during the Afghanistan campaign made his historic march from Kabul to Kandahar where he won a complete victory After serving as C-in-C., India, 1885–93, and as C.-in-C , Ireland, 1895–99, took over in South Africa in December, 1899, and entirely reversed the unhappy military situation before handing over to Kitchener a year later. C-in-C from 1901 until the office was abolished in 1904, and was latterly an ardent advocate of conscription

Robertson, Sir Charles Grant, C.V.O. (1869–1948), English historian who was Vice-Chancellor of Birmingham University, 1927–38, and Principal 1920–38. His works include *The Rise of the English Nation* 1895, *England under the Hanoverians*, 1911, and *Bismarck*, 1918.

Robertson, Field-Marshal Sir William, Bt., G.C B , G.C M G , G.C V O., D S O. (1860–1933), the only British soldier to rise from Private to Field-Marshal, served as C.I G.S , 1915–18. His son, **Brian Hubert, Lord Robertson,** G.C.B. (b. 1892), has had a distinguished military career and was Chairman of the British Transport Commission, 1953–61.

Robeson, Paul Le Roy (b. 1898), the famous Negro singer and actor, who through his singing of spirituals has increased our knowledge and understanding of the Negro. Was a great success in London in 1930 playing *Othello*.

Robespierre, Maximilien François Marie Isidoire de (1758–94), was a country advocate until the outbreak of the French Revolution, when he went to Paris, became an enthusiastic leader of the Jacobin Party, and was made a Member of the Assembly. In the Reign of Terror as President of the Committee of Public Safety he sent vast numbers to the guillotine. Then a counter-movement was set on foot and he was denounced in the Assembly, and, trying to escape, was shot and subsequently guillotined.

Robey, Sir George, C.B.E. (**George Edward Wade**), (1869–1954), famous British comedian of the music-hall.

Robinson, William Heath (1872–1944), English book illustrator, but especially known for the fantastically comic designs of his cartoons and stage scenery.

Rob Roy (the traditional nickname of **Robert McGregor**) (1671–1734), a noted Highland outlaw who levied blackmail on the farmers and rich people of the country-side in return for certain protective services. He belonged to the clan McGregor.

Robsart, Amy (1532–1560), daughter of Sir John Robsart, and wife of Robert Dudley, afterwards Earl of Leicester. While living in seclusion at Cumnor Place under the charge of Anthony Forster, she met her death either by accident or foul play, by the latter according to common belief, Elizabeth's favourite having reason to wish her out of the way. She was discovered dead at the bottom of an old staircase.

Rockefeller, John Davison (1839–1937) was said to be the richest man in the world. Was born on a small farm in New York State, and there worked until sixteen. Migrated to Cleveland, and found employment in an office for a few years. About this time the oil trade was in a disorganised condition, owing to the reckless trading and crude methods of refining. Rockefeller saw what was wrong, and resolved upon trying to remedy it. Later he began oil-refining, and entered into the business with such vigour of purpose, and made so many improvements, that he became a millionaire in a very few years. From the exertions of himself and associates grew the Standard Oil Trust, beginning with a capital of £200,000 in 1870, and extending at such a rate that in 1892 the capital had reached twenty-two millions sterling. During his life-time he gave some 750 million dollars to education and charity.

Rodin, Auguste (1841–1917), the most celebrated French sculptor of recent days, who possessed a bold and original genius. His numerous statues and his fine historic monuments, especially that for Calais commemorating the bravery of Eustache de Saint-Pierre, brought Rodin well-deserved fame.

Rodney, 1st Baron, K.B. (1719–92), a famous English admiral who, having gained numerous victories routed the French fleet under the Comte de Grasse, whom he took prisoner, the result of this crowning success being the Peace of Versailles, 1783.

Rogers, William Penn Adair ("Will") (1879–1935) was America's foremost humorist and a famous stage and film star; was killed with Wiley Post on a holiday flight to Alaska Aug. 15, 1935.

Roland de la Platière, Madame Manou Jeanne (1754–93), was one of the leading figures of the French Revolution. Her husband, **Jean Marie Roland de la Platière** (1734–93), who was one of the Ministers during the Girondist period, escaped from Paris on the disruption of his Party, but his wife remained behind, and was sent to the guillotine. During her incarceration she wrote an *Appeal to Posterity*, remarkable for its beauty of sentiment and patriotic enthusiasm. Her husband committed suicide on receiving the news of her execution.

Rolland, Romain (1866–1944), an eminent French author whose finest work, *Jean-Christophe*, in ten vols., gained him the Nobel Prize for Literature, 1915.

Romilly, Sir Samuel, K.C. (1757–1818), a famous English lawyer who was Solicitor-General in 1806 and for many years had a distinguished career both in Parliament and at the Bar. He effected many improvements in the Criminal Law.

Rommel, Field-Marshal Erwin (1891–1944), was probably the ablest German general engaged in

the second world war. His conduct of the war during the North African campaign won high praise and brought the redoubtable Afrika Corps nearly to Alexandria. He was also engaged in the campaigns in Western Europe in 1940 and 1944.

Romney, George (1734–1802), was born in North Lancashire, studied portrait painting with a Kendal artist, and for a few years obtained a living by local portrait painting. Going to London in 1762, his talent gained him speedy recognition; and after studying for a couple of years in Rome, he set up as a portrait-painter in Cavendish Square, and became highly successful. His portraits are among the finest examples of that kind of art that England has produced, and to-day realise large prices.

Rontgen, Professor Wilhelm Konrad (1845–1923), the eminent German scientist who discovered the Röntgen rays in 1895. He made other important laboratory investigations, resulting in the solution of difficult chemical problems.

Roosevelt, President Franklin Delano (1882–1945), great American statesman Was Assistant Secretary to the Navy under Wilson and unsuccessful Democratic candidate for the vice-presidency in 1920. In 1921 was stricken with infantile paralysis, but recovered sufficiently to re-enter public life and become Governor of New York in 1929. From 1933 until his death served as President of the U S.A., being the first American to be elected for more than two terms. His New Deal programme (see Gen. Information Section) was outstanding in his domestic policy. His "good neighbor" attitude towards the other American countries, his hamstrung efforts to restrain Axis aggression in the 1930s, his inspired and generous adoption of Lend-Lease, his war-time meetings with Churchill and Stalin, and his energetic prosecution of the war after Pearl Harbour, were the more important features of his foreign policy. His "fireside" talks on the radio brought him into close contact with the American people and his passing in the hour of victory was mourned all over the world In 1905 married his distant cousin, **Eleanor Roosevelt** (1884–1962), who became known on her own account as a sociologist and newspaper columnist She became Chairman of the U.N. Human Rights Commission in 1947.

Roosevelt, Theodore (1858–1919), Republican President of the U S.A., 1901–9, and unsuccessful third party candidate in 1912 following a dispute with Taft. His daring exploits in the Spanish-American war won him wide popularity and he was elected vice-president in 1900 becoming president on McKinley's assassination. For his efforts in promoting peace, notably between Russia and Japan, was awarded the Nobel Prize in 1906. The great struggle with the Trusts marked his years of office.

Rops, Félicien (1833–98), Belgian artist, famous for drawings, etchings, and illustrations. His work is highly original, spirited, humorous and a valued commentary on the life at the time. Was an engraver of magnificent technical skill and a painter of merit.

Ross, Sir James Clark, F R S. (1800–62), most experienced polar explorer of the century. He accompanied his uncle, Sir John Ross, and Captain Parry on their expeditions. In the *Victory* commanded by his uncle he located the north magnetic pole in 1831. He commanded the expedition of the *Erebus* and the *Terror* to the antarctic (1839–43), discovering Victoria Land, Mounts Erebus and Terror, and the Ross ice barrier.

Ross, Rear Admiral Sir John, K.C.B. (1777–1856), the eminent explorer who made several voyages to the arctic and searched for the North-west Passage. He discovered Boothnia peninsula, and his nephew reached the magnetic pole.

Ross, Colonel Sir Ronald, K.C B , K C.M.G., F.R.S. (1857–1932), professor of tropical sanitation and a leading authority on tropical diseases generally, was for many years in the Indian Medical Service, and was awarded the Nobel Prize for Medicine in 1902. Discovered the malaria parasite.

Rossetti, Dante Gabriel (1828–82), was the son of **Gabriele Rossetti** (1783–1852), an exiled Italian author who settled in London in 1824. Dante showed great talent as a painter from boyhood, and became one of the Pre-Raphaelite Brotherhood, formed in 1848. He also distinguished himself as a poet His sister, **Christina Georgina Rossetti** (1830–94) was also noted as a poet

Rossini, Gioacchino Antonio (1792–1868), Italian operatic composer. His first opera *Tancredi* was produced at Venice when he was 21, and between 1816 and 1823 he wrote 21 operas, including *Il Barbiere di Seviglia*, *La Cenerentola*, *Otello*, *La Donna del Lago*, and *Semiramide*. After writing *Guillaume Tell* in 1829, which was hailed as his masterpiece, he gave up composing, producing only a *Stabat Mater* (1832–41) and a mass (1864).

Rostand, Edmond Eugene Alexis (1868–1918), French dramatist whose *Cyrano de Bergerac* created a sensation in 1898.

Rothenstein, Sir William (1872–1945), English painter and writer. Prof. of Civic Art in Sheffield University, 1917–26. Principal of Royal College of Art, 1920–35. Trustee, Tate Gallery, 1927–33. His son, **Sir John Rothenstein**, C B.E. (b. 1901), is Director of the Tate Gallery

Rothschild, Anselm Meyer (1743–1812), the founder of the famous financial family was born at Frankfort-on-Main. After some experience in a bank as clerk, set up for himself first as a moneylender, then as a banker and displaying a genius for finance acquired a large fortune. His son, **Nathan Meyer Rothschild** (1777–1836), took charge of the London house, and conducted its affairs with great success, and was made an Austrian Baron in 1822. He was succeeded by his eldest son, **Baron Lionel de Rothschild** (1808–1879), who was the first Jewish member of the House of Commons.

Roubillac, Louis François (1695–1762), a French sculptor who contributed many monuments to Westminster Abbey

Rouget de Lisle, Claude Joseph (1760–1836), a French poet who was the author of the words and the music of the *Marseillaise*, the revolutionary song and national anthem of France.

Rousseau, Jean-Jacques (1712–78), French philosopher, political writer, and composer He was born at Geneva, and after a hard and wandering life made the acquaintance of Madame de Warens, who became his patroness and with whom he resided during the years 1731–41. He then proceeded to Paris, where he made the acquaintance of Diderot, to whose *Encyclopédie* he contributed the musical section. With the production of his pastoral melodrama *Le Devin du village* in 1722 he appeared as a successful composer. Meanwhile he had been studying social questions with great ardour, and in 1761 published his novel *Julie, ou la Nouvelle Héloïse*, which was followed in 1762 by *Emile*, a treatise on education in novel form. These two works contained so much that was at variance with convention, and so opposed to all ideas of moral restraint, that they called forth the condemnation of the orthodox, and Rousseau was obliged to leave France for a time It was while in England that he wrote his remarkable *Confessions*, and his celebrated *Le Contrat Social*. He gave to France a new field of thought, and laid down principles of government and conduct which bore fruit in the French Revolution (*See also* **Education, Section J.**)

Rubens, Sir Peter Paul (1577–1640), one of the most notable of Flemish painters In 1629 he painted for Charles I , who knighted him. His *Adoration of the Magi* was sold in 1959 for the record price of £275,000

Rubinstein, Anton Grigorovich (1829–94), a famous Russian pianist and composer and founder of the Conservatory St. Petersburg (now Leningrad). His brother Nicholas (1835–81), also a pianist, founded the Conservatory of Moscow.

Rupert, Prince (1619–82), the brilliant Royalist cavalry general opposing Cromwell and a distinguished admiral in the Dutch wars. He was also an early mezzotinter, an experimental scientist, and the first governor of Hudson's Bay Company.

Rusk, Dean, M.A., LL.D. (b. 1909), U.S. Secretary of State in the Democratic Administration, 1961– ; Pres. The Rockefeller Foundation, 1952–60. Former Rhodes scholar at St. John's Coll., Oxford.

Ruskin, John (1819–1900), writer and art critic,

the son of a wealthy London wine merchant. His *Modern Painters* exhibited a masterly perception of the principles of art and a boundless gift of literary expression. Other volumes appeared at intervals including *The Seven Lamps of Architecture* and *The Stones of Venice*, two memorable works which considerably enhanced the author's fame. His writings undoubtedly hastened the recognition of Turner and the Pre-Raphaelite painters. Always taking a deep interest in economic questions, Ruskin delivered and published numerous lectures on a wide range of subjects—art, pleasure, religion, war, work, and so forth; and he was acknowledged to be one of the greatest thinkers of the time. Often his views were impracticable and even eccentric, but behind them there was always evident a sincere desire to promote the well-being of the people.

Russell, Bertrand (Arthur William) 3rd Earl, O.M., F.R.S., M.A. (b. 1872), great English philosopher and mathematician, whose vigorous and sceptical writings are having a profound effect on present-day thought. He writes and speaks in a clear, witty, and elegant style and regards the task of the philosopher as one of clarification rather than speculation. In recent years Lord Russell has been actively engaged in the campaign against nuclear warfare. His numerous writings include books on mathematics, philosophy, and ethics, besides works on political and sociological subjects: *The Principles of Mathematics* (1903), *Principia Mathematica* (1910), written in collaboration with A. N. Whitehead, *Problems of Philosophy* (1911), *Marriage and Morals* (1929), *History of Western Philosophy* (1945), *Human Knowledge* (1948), *Commonsense and Nuclear Warfare* (1959). Nobel Prize for Literature, 1950.

Russell, George William (1867–1935), Irish poet generally known by his pen name of A.E. or Æ. Widely known as a leader in co-operative enterprise and a pioneer of Abbey Theatre, Dublin.

Russell, John, 1st Earl, K.G., P.C. (1792–1878), third son of the 6th Duke of Bedford. Entered Parliament as Lord John Russell on attaining his majority, and, ranging himself on the Liberal side, showed great capacity for affairs. Introduced first great measure of Reform, which was passed in 1832. Held several offices before succeeding Peel as Prime Minister in 1846. Remained in power until 1852, and was again Prime Minister from 1865 to 1866, resigning when he failed to carry a further reform bill. He also wrote lives of Thomas Moore and Charles James Fox.

Russell of Killowen, Baron, P.C., G.C.M.G. (1832–1900), Lord Chief Justice of England 1894–98. Was one of the greatest British judges and advocates of the 19th century.

Rutherford, Lord, O.M., F.R.S. (1871–1937), of New Zealand birth. Physicist, pre-eminent in the field of atomic research. Conducted his experiments at Montreal, Manchester, and at the famous Cavendish Laboratory at Cambridge, which attracted brilliant young scientists from all over the world. In 1911 announced his nuclear theory of the atom, and in 1918 succeeded in splitting the atom for the first time. His work paved the way for future nuclear research.

Ruysdael, Jacob van (c. 1628–82), great Dutch landscape painter, some of whose pictures are in the National Gallery.

Ruyter, Admiral Michiel Adriaanzoon de (1607–76), the Dutch admiral who in 1667 invaded England with a fleet of Dutch war vessels, advancing up the Thames and Medway and setting fire to considerable shipping. He soon saw fit to retreat, and more serious trouble was averted.

S

Sachs, Hans (1494–1576), the German shoemaker-poet of Reformation times, was an earnest worker in the Protestant cause, and wrote over 5,000 different pieces, poetry and prose.

Sadi, or Saadi (Muslih-Uddin) (c. 1184–1292), the Persian poet who flourished in the 13th century, and won national fame by his poems *The Garden of Roses* and *The Orchard*.

Sainte-Beuve, Charles Augustin (1804–69), French critic, and one of the most accomplished men of letters under the Second Empire. Author of *Causeries du lundi* and *Histoire de Port Royal*.

Saint-Just, Antoine (1767–94), one of the later leaders of the French Revolution closely associated with Robespierre.

St.-Laurent, Rt. Hon. Louis Stephen, Q.C. (b. 1882), Prime Minister of Canada, 1948–57.

Saint-Saens, Charles Camille (1835–1921), French composer. He made his debut as a pianist at 10, studied at the Paris Conservatoire, and was for 20 years organist at the Madeleine. His compositions have a classical style and elegance and include symphonic and chamber music and the opera *Samson et Dalila*, which was produced by Liszt at Weimar in 1877.

Saint-Simon, Claude, Comte de (1760–1825), a French scientist and socialist who had great influence upon the thought of his time.

Saintsbury, George Edward Bateman (1845–1933). Professor of Rhetoric and English Literature, Edinburgh University, 1895–1915. Author of numerous critical works on literary subjects, on which he was a leading authority.

Sala, George Augustus Henry (1828–95), journalist of high literary merit who contributed to *Household Words*, the *Illustrated London News*, *Cornhill*, *Temple Bar* (founder and editor), and the London *Daily Telegraph* (foreign correspondent in all parts of) the world).

Saladin (1137–93), the great Sultan of Egypt and Syria who led the Moslems against the Christians in the Third Crusade. In 1187 he had driven the Christians from Jerusalem after a brilliant victory at Hattin near Tiberias. This gave rise to the Third Crusade led by the Emperor Frederick I, Philip II. of France, and Richard I. of England, which achieved little. Besides being a great warrior, Saladin was a wise and cultured man, renowned for his chivalry.

Salazar, Antonio d'Oliveira (b. 1889), Prime Minister and virtual dictator of Portugal since 1932 and responsible for drafting the Portuguese constitution of 1933. Foreign Minister, 1936–47.

Salda, František (1867–1937), Czech critic, essayist, and poet whose influence on Czech thought has been profound.

Salimbene de Adamo (1221–c. 1288), mediæval chronicler whose vivid description of life in the 13th century is embodied in his *Cronica*.

Salisbury, Robert Arthur Talbot Gascoyne Cecil, 3rd Marquess of, K.G. (1830–1903), led the Conservative Governments of 1885–86, 1886–92, and 1895–1902. Has been considered one of the best Foreign Secretaries England has ever had, holding the office from 1878 to 1880, when he attended the Congress of Berlin, and for much of his premiership. Retired from political life after peace was declared in South Africa. His grandson, **Robert Arthur James Gascoyne-Cecil, 5th Marquess of Salisbury**, K.G. (b. 1893), was Leader of the House of Lords, 1942–45 and again 1951–57 when he resigned from the Government over its Cyprus policy. As Viscount Cranborne served as Sec. of State for the Dominions and for the Colonies.

Samuel, 1st Viscount, P.C., O.M., G.C.B., G.B.E. (1870–1963), Liberal statesman, High Commissioner for Palestine, 1920–22, Postmaster-General, 1910–14, and again May to Dec. 1915; Home Secretary, 1916, and again 1931–32. M.P. for Cleveland Division (N. Riding, Yorks), 1902–18, and Darwen Div. of Lancs., 1929–35. Chancellor of the Duchy of Lancaster, 1909–10 and 1915–16. Leader of the Liberal Party in the Commons, 1931–35, and in the Lords, 1941–55.

Sand, George (1804–76) the leading French authoress of her time—proper name, Armandine Lucile Aurore Dupin, baronne Dudevant—who, both as novelist and dramatist, achieved the highest success. A friend of men of such singular power as Alfred de Musset, Chopin and Sandeau.

Sanger, Frederick, B.A., Ph.D., F.R.S. (b. 1918), British scientist; Prof. of Biochemistry, Cambridge. Awarded 1958 Nobel Prize for Chemistry for his work in determining the chemical structure of the protein insulin.

Sankey, Ira David (1840–1908), the celebrated American evangelist, singer, and composer, associated with Dwight L. Moody, the revivalist (1837–1899) in mission-work in America and Great Britain for many years.

San Martin, General José de (1778–1850), the principal figure in the liberation from Spanish rule of three countries: his native Argentina, Chile, and Peru.

Santayana, George (1863–1952), philosopher and poet, born in Madrid of Spanish parentage. He was Professor of Philosophy at Harvard University (where he graduated in 1886) from 1907–12, when he moved to France and thereafter spent his time wandering from country to country. His books include *The Life of Reason* (1905–6), the four volumes of *Realms of Being* (1923–40), *Persons and Places* (1945), and *The Middle Span* (1948).

Santos-Dumont, Alberto (1873–1932), Brazilian aeronaut, his most notable flights being made in Paris, and at Monte Carlo. He visited London in 1903.

Sappho of Lesbos (fl. early 6th cent. B.C.), famous lyric poetess of ancient Greece, of whose love poems only a few fragments remain.

Sardou, Victorien (1831–1908), French dramatist who had a long series of successes—*Nos Intimes, Séraphine, Rabagas, Divorçons, Fédora, Théodora, Patrie, La Tosca, Madame Sans-Gêne, Robespierre*, and *Dante*, the last-named written specially for Sir Henry Irving. He was elected to the French Academy in 1877.

Sargent, Sir Harold Malcolm Watts, A.R.C.O., F.R.C.M., F.R.S.A. (b. 1895), one of the best known modern British conductors. Succeeded Sir Adrian Boult as permanent conductor of the B.B.C. Symphony Orchestra, 1950–57.

Sargent, John Singer, R.A. (1856–1922). He was of American parentage and received his art education in Paris. As a portrait-painter he had few equals.

Sarolea, Charles, D.Ph., D.Litt., LL.D. (b. 1870), a great scholar and authority on literature. Belgian by birth, but now a naturalised Englishman.

Sartre, Jean-Paul (b. 1905), French existentialist philosopher, left-wing intellectual, dramatist, and novelist. Captured by the Germans in 1940, he was released on medical grounds the following year and joined the resistance movement. His major philosophical work is *L'Etre et le Néant* and his plays include *Les Mouches, Huis Clos, Crime passionnel, La Putain respectueuse*, and *Les Séquestrés d'Altona*.

Sassoon, Siegfried (Lorraine), C.B.E. (b. 1886), English poet and writer who received the Hawthornden Prize, 1929, for *The Memoirs of a Fox-hunting Man*.

Savonarola, Girolamo (1452–98), Florentine preacher and reformer, a Dominican friar, who denounced vice and corruption not only in society but also in the Church itself, especially attacking Pope Alexander VI. He was excommunicated, imprisoned, and with two of his companions hanged in public. His passion for reform made him impatient of opposition and incapable of compromise. He understood men's hearts but not their limitations. Yet he was a noble figure rightly commanding the respect of later ages. George Eliot's historical romance *Romola* gives a fine portrait of Savonarola.

Sayce, Prof. Archibald Henry, D.Litt., LL.D., D.D. (1845–1933), a distinguished Assyriologist and philologist who was Prof. of Assyriology at Oxford University, 1891–1919. His most important works are *Introduction to the Science of Language*, 1879, *Ancient Empires of the East*, 1884, *The Principles of Comparative Philology*, 1874, and *Egypt and Babylonian Religion*, 1903.

Scarlatti, Alessandro (1659–1725), Italian musician whose influence on the history of opera has been great, founded the Neapolitan school. He composed over 100 operas, 200 masses, and over 700 cantatas and oratorios. His son Domenico (1685–1757) was a harpsichord virtuoso and his work has had an important influence in the evolution of the sonata. The chief years of his life were spent at the Spanish Court in Madrid.

Schiaparelli, Giovanni Virginio (1835–1910), famous Italian astronomer who was Director of the Milan Observatory, 1862–1900, and did valuable work on meteors and double stars, but is best known for his discovery of so-called canals on Mars.

Schiller, Johan Christoiph Friedrich (1759–1805), the famous German dramatist and poet. Was born at Marbach in Württemberg. Educated at the Military Academy at Stuttgart, and intended for a soldier, he evinced an irresistible desire for literary fame, and in 1782 had his first play, *The Robbers*, successfully produced at the Mannheim Theatre, to which he was subsequently appointed dramatic composer. Later he went to Dresden, where he completed his *Don Carlos*; from 1789 to 1793 he held the chair of history at Jena Univ. when he wrote his *History of the Thirty Years' War*, and gained the friendship of Goethe, at whose suggestion he removed to Weimar, and during the next ten years produced his greatest works—*Wallenstein, Mary Stuart, The Maid of Orleans*, and *William Tell*. A favourite among his many ballads is "The Song of the Bell."

Schlegel, August Wilhelm von (1767–1845), German poet and scholar, best known for his translations of Shakespeare (which established Shakespeare in Germany), Dante, Calderón, and Camões. His *Lectures on Dramatic Art and Literature* are outstanding for their scholarship.

Schliemann, Heinrich (1822–90), German archæologist who made many notable excavations, discovered Troy and other Homeric sites.

Schnabel, Artur (1882–1951), American pianist of Austrian birth, regarded as the greatest exponent of Beethoven's pianoforte sonatas.

Schonberg, Arnold (1874–1951), Austrian composer who in 1933 was dismissed from his post as head of the Prussian Academy of Fine Arts because of his Jewish ancestry. He went to the United States, teaching first at Boston and then at Los Angeles. Among his works are the choral orchestral *Gurre-Lieder* and *Pierrot Lunaire*, a cycle of 21 poems for voice and chamber music.

Schopenhauer, Arthur (1788–1860), was a German philosopher of a pessimistic cast of mind. His mysticism partakes somewhat of the higher Buddhism. His chief works are *The World Considered as Will and Idea* and *The Two Fundamental Problems of Ethics*.

Schreiner, Olive, pen name of Mrs. Cronwright Schreiner (1855–1920), a noted South African novelist, born in Basutoland. She first attracted attention with her successful *Story of an African Farm* (1883) by which work she is best known. She excelled in depicting veldt scenery and Dutch character.

Schubert, Franz Peter (1797–1828), Austrian composer, born in Vienna, the son of a schoolmaster. He was a contemporary of Beethoven and wrote not only symphonies, sonatas, string quartets, choral music, and Masses but also over 600 songs of unsurpassed lyrical beauty. It is as creator of the German *Lied* that his name is immortal. He died in Vienna at the age of 31, in poverty, before the full flowering of his musical genius.

Schumann, Robert Alexander (1810–56), composer of the early 19th-century German Romantic school. He wrote much chamber music, four symphonies, a piano concerto, and choral music, but it is his early piano pieces and songs that give constant delight. His wife Clara (1819–96) was one of the outstanding pianists of her time, especially as interpreter of Chopin.

Schweitzer, Albert, D.Theol., Dr. Phil., Dr. Med. (b. 1875), missionary in Lambaréné, a musical critic and authority on Bach's music, a famous organist, and a noted biblical critic who became a Doctor of Medicine in order to devote his life to missionary work in Equatorial Africa. Awarded 1952 Nobel Prize for Peace and Hon. O.M. in 1955.

Scipio, Publius Cornelius (*circa* 232–183 B.C.), the greatest of the Scipios known as Scipio Africanus the elder. A distinguished Roman general in the 2nd Punic War.

Scott, Charles Prestwich (1846–1931), English journalist who was editor of the *Manchester Guardian*, 1872–1929, which under his editorship became one of the leading journals of the country.

Scott, Sir George Gilbert, R.A. (1811–78), architect who gained special fame for his restorations of Gothic churches and cathedrals, incl. Westminster Abbey, designer of the Albert Memorial, St. Pancras Station, the Martyrs' Memorial at Oxford, and St. Anne's Church in Alderney.

Scott, Sir Giles Gilbert, O.M., R.A., F.R.I.B.A. (1880–1960), architect whose work includes the great modern Gothic Liverpool Cathedral (begun 1904 and still under construction) and Waterloo Bridge. Grandson of the above.

Scott, Peter Markham, M.B.E., D.S.C. (b. 1909), son of Captain Scott, is known as yachtsman,

broadcaster, author of *The Battle of the Narrow Seas*, and bird-artist.

Scott, Captain Robert Falcon, C.V.O. (1868–1912), commanded the National Antarctic Expeditions in 1901–4 and in 1910. His ship, the *Terra Nova*, left England on June 1, 1910. In Jan. 1911, winter quarters were established at Cape Evans, and in the following November Scott and a select party left Hut Point for the South Pole, which they reached on Jan. 18, 1912, finding there the Amundsen records. On the return journey every member of the party perished. Leading-seaman Edgar Evans died from concussion of the brain on Feb. 17; Capt Oates from exposure on March 17; and on March 29 the rest of the party (Scott, Wilson and Bowers) died from starvation and exposure in a blizzard when only 11 miles from One Ton Depot.

Scott, Sir Walter, Bart. (1771–1832), one of the greatest of British novelists and a distinguished poet. He was educated for the Bar His *Minstrelsy of the Scottish Border* was published in 1802. This was followed in 1805 by *The Lay of the Last Minstrel*, in 1808 by *Marmion; The Lady of the Lake*, *Rokeby* and *The Lord of the Isles* coming afterwards in quick succession. In 1814 he published *Waverley* anonymously, which obtained instant success. Other stories followed and the Waverley novels and their author, "The great Unknown," were everywhere the subject of discussion *Guy Mannering*, *The Antiquary*, *Old Mortality*, *Rob Roy*, and the *Heart of Midlothian* were all published before the secret of their authorship was disclosed The chief works of his last years were *Woodstock*, *Life of Napoleon*, and *Tales of a Grandfather*. He died at Abbotsford. Created a baronet in 1820

Scott-Paine, Hubert (1891–1954), pioneer in the design and construction of aircraft and sea craft, in particular flying-boats and high-speed motor-boats.

Scriabin, Alexander (1872–1915), Russian composer and pianist He studied at the Moscow conservatoire, where he was later professor of the pianoforte, 1898–1904. He was deeply interested in theosophy, and in such works as *The Divine Poem*, and *Prometheus. a Poem of Fire* he attempted to unite music and philosophy.

Seeley, Sir John Robert, K C M G (1834–95), was an historian of note, but acquired his chief fame as a writer by his *Ecce Homo* and *Natural Religion*

Segovia, Andrés (b. 1894), Spanish concert-guitarist. He has adapted works by Bach, Haydn, Mozart, and other classical composers to the guitar

Selfridge, Harry Gordon (1858–1947), the American who revolutionised the British department store when he opened the famous shop of Selfridges in Oxford Street in 1909. Noted for his ambitious advertising and lavish entertaining

Seneca, Lucius Annaeus (*circa* 4 B C–A D. 56), the famous stoic philosopher, who was tutor to Nero, and one of that emperor's most influential advisers, he was sentenced to end his own life, a sentence which he courageously carried out

Senefelder, Alois (1772–1834), was the son of an actor at Munich, and himself engaged in dramatic composition Being too poor to bear the cost of having his works printed, he turned his attention to inventing lithography, the main feature of the invention being discovered by accident.

Severus, Lucius Septimius (146–211), was Roman Emperor from 193 to his death. After many victories in the East he passed over to Britain with an army, subjugated the Caledonians, and repaired and partly rebuilt the famous Hadrian's wall from the Solway Firth to the mouth of the Tyne. He died at York.

Sévigné, Marie de Rabutin-Chantal, Marquise de (1626–96), French woman of letters. Her letters to her daughter Françoise written in an unaffected elegance of style give a moving picture of fashionable society in 17th-century France.

Sgambati, Giovanni (1841–1914), Italian pianist and composer who revived interest in classical instrumental music in an age of opera. Well known is his quartet in D flat.

Shackleton, Sir Ernest (Henry), C.V.O., O.B.E. (1874–1922), commander of the Nimrod Farthest South expedition of 1907–9, reached within 100 miles of the South Pole, and embarked on a new expedition in 1914. He died whilst on a scientific voyage to the Antarctic.

Shaftesbury, Anthony Ashley-Cooper, 7th Earl of (1801–85), a distinguished philanthropist, identified himself with the Ten-Hours Bill, connected with the Ragged School Union, Reformatories, Refuges, and Christian Associations of many kinds.

Shakespeare, William (1564–1616). England's greatest poet and dramatist, was born at Stratford-on-Avon, and was the son of a tradesman of that town who must have been at one time fairly well-off, seeing that he was made an alderman, and afterwards served as High Bailiff. Later on, however, he appears to have been unfortunate and fallen into straitened circumstances William was the eldest son, and was probably educated at the Stratford Grammar School, but very little is known of his career up to his eighteenth year, when we have it on record that he married Anne Hathaway, who was eight years his senior. Five years after his marriage he went to London, and the next we hear of him is that he was connected with the Globe Theatre and appeared in sundry small parts. He first appeared before the public as a poet in 1593, with his *Venus and Adonis*, following this in 1594 with *The Rape of Lucrece*, Shortly afterwards he was proprietor of the Globe Theatre, and also had an interest in the Blackfriars Theatre. Then he began that remarkable career of play-writing which has since been the wonder of the world. Thirty-eight plays comprise the Shakespeare canon. Thirty-six were printed in the First Folio of 1623 (the first collected edition of his dramatic works), of which eighteen had been published during his lifetime in the so-called Quartos. *Love's Labour's Lost* and *The Comedy of Errors* seem to have been among the earliest, being followed by *The Two Gentlemen of Verona*, and *Romeo and Juliet* Then followed *Henry VI*, *Richard III*, *Richard II*, *Titus Andronicus*, *The Taming of the Shrew*, *King John*, *The Merchant of Venice*, *A Midsummer Night's Dream*, *All's Well that Ends Well*, *Henry IV*, *The Merry Wives of Windsor*, *Henry V*, *Much Ado about Nothing*, *As You Like It*, *Twelfth Night*. Then came some of his greatest plays, *Julius Cæsar*, *Hamlet*, *Troilus and Cressida*, *Othello*, *Measure for Measure*, *Macbeth*, *King Lear*, *Timon of Athens*, *Pericles*, *Antony and Cleopatra*, *Coriolanus*, *Cymbeline*, *A Winter's Tale*, *The Tempest*, *Henry VIII*, and *The Two Noble Kinsmen*. It was evident that his plays were remunerative, inasmuch as in a few years he was able to purchase property at Stratford, and when he retired from his profession (about 1610 or 1612) he returned to his native town to live in a house which he had himself built. He died at Stratford at fifty-two, and was buried in Stratford Church.

Sharp, Granville (1735–1813), slavery abolitionist and founder of the colony of Sierra Leone.

Shaw, George Bernard (1856–1950), brilliant Irish dramatist who conquered England by his pungent wit and devastating exposure of hypocrisy, cant and national weaknesses, and persistently expressed a highly individual opinion whether in his musical criticisms, socialist pamphlets or plays. He wrote many plays including *Man and Superman*, *Heartbreak House*, *Back to Methuselah*, *Saint Joan*, *The Apple Cart*, *Buoyant Billions*, most of which have important prefaces, sometimes equalling the play in length. Was music critic (1888–94) successively to the London *Star* and *World* and during this period wrote *The Quintessence of Ibsenism* and *The Perfect Wagnerite*. Joined the Fabian Society in 1884 and was awarded Nobel Prize for Literature in 1925. He was greatly interested in the reform of the alphabet to save time and labour, and left on trust part of his estate for the carrying out of his ideas. His house at Ayot St. Lawrence was taken over by the National Trust.

Shelley, Percy Bysshe (1792–1822), one of the most brilliant poetic geniuses of the 19th century, renowned for the daring and unorthodox opinions which he held. His *Queen Mab* (written when he was nineteen), his *Alastor*, *The Revolt of Islam*, *The Witch of Atlas*, and *Adonais* all breathe the true spirit of poetry.

securing him a place in the first rank of British poets. He showed fine dramatic gifts in the *Cenci* and *Prometheus Unbound*, almost reaching sublimity in the latter masterpiece. His *Adonais* was a splendid tribute to the genius of Keats. His first wife, whom he married while very young, committed suicide. He afterwards married Mary Wollstonecraft Godwin, and formed other attachments of a complicating nature. Was always at war with his family, and finally, after spending some time with Byron and Leigh Hunt and other friends in various parts of Italy, was drowned in the Gulf of Spezia by the capsizing of his boat in a storm.

Shepard, Ernest Howard (b. 1879), chief cartoonist of *Punch* since 1945. Illustrator of *Winnie-the-Pooh* and other books by A. A. Milne.

Sheppard, Very Rev. Hugh Richard Lawrie (Dick), C.H., D.D. (1880–1937), Vicar of St Martin-in-the-Fields, London, 1914–27, where he established a reputation by his broadcast sermons and attracted large crowds of listeners. Dean of Canterbury, 1929–31, Canon of St. Paul's, 1934–37. Buried in Canterbury Cathedral.

Sheraton, Thomas (1751–1806), was the last of the great English cabinet-makers of the 18th century. The Sheraton style which he introduced marks a reaction against Chippendale (*q.v.*).

Sheridan, Rt. Hon. Richard Brinsley Butler (1751–1816), one of the greatest of English playwrights, whose comedies are frequently revived. Was born in Dublin, and educated partly at Harrow. Showing considerable capacity for dramatic composition he obtained an introduction to the Covent Garden management, and it was at the Covent Garden Theatre in 1775 that his first comedy, *The Rivals*, was produced, with such a gratifying result that Garrick, who was then at Drury Lane, opened up negotiations with the dramatist which ended in Sheridan becoming part (and ultimately sole) proprietor of Drury Lane *The Duenna*, a musical comedy, was produced in 1775, and ran through the winter. From 1777 Sheridan managed Drury Lane, opening with an adaptation of Vanbrugh's *Relapse* This was followed by the production of the greatest of his comedies, *The School for Scandal*, which had a wonderful success. In 1779 *The Critic* was given, and after that Sheridan wrote no more plays until 1789, when *Pizarro* was produced. In the meantime he had gained a high reputation in another sphere. In 1780 he obtained a seat in Parliament and although he only spoke on certain set occasions, he acquired a reputation for oratory which stood him in very good stead, and he filled one or two minor Ministerial offices, remaining in Parliament until 1812.

Sherman, General William Tecumseh (1820–91), a famous American soldier who, after taking part in the War with Mexico (1846–48), volunteered at the outbreak of the Civil War (1861) He took part in the battles of Bull Run and Shiloh, and was placed in command of the Army of the Tennessee (1863) and of the military division of the Mississippi with a force of 100,000. In 1864 there occurred the famous 300-mile march across Georgia to the sea. In 1865 his second march, through the Carolinas, culminated in the defeat of Johnston, which led directly to the termination of the war.

Sherrington, Sir Charles Scott, O.M., G.B.E., F.R.S., M.D., D.Sc. (1857–1952), one of the greatest of British scientists, and a leading authority on the physiology of the nervous system, whose research work over many years led to great advances in the surgery of the brain. Pres. of the British Association 1920, and of the Royal Society, 1920–25. Awarded Nobel Prize for Medicine, 1932.

Shirley, James (1596–1666), was an eminent dramatist and poet, imbued with the Elizabethan traditions. He and his wife are said to have died from shock after the Great Fire.

Shostakovich, Dmitry Dmitryevich (b. 1906), one of the most celebrated of present-day Russian composers. His music is complex, profound, and deeply significant of the Soviet age in which he lives. His works include operas, ballets, symphonies, chamber music, and music for films.

Sibelius, Jean Julian Christian (1865–1957), Finnish composer, generally acknowledged as the greatest of the century. Works include seven symphonies, violin concerto, several tone poems, about 200 pianoforte compositions and songs.

Sickert, (Walter) Richard (1860–1942), British painter and etcher; became President of Royal Society of British Artists, 1928.

Siddons, Sarah (1755–1831), the daughter of Roger Kemble, a theatrical manager. The greatest tragic actress of her time.

Sidgwick, Henry (1838–1900), Professor of Moral Philosophy at Cambridge, and besides being an eminent educationist in the broader sense, devoted himself with special success to the cause of women's education, Newnham and Girton being largely the outcome of his efforts

Sidney, Sir Philip (1554–86), statesman, poet and soldier, was one of Queen Elizabeth's favourites, and a man of singular ability and bravery, While living in temporary retirement he composed his famous *Arcadia*, but did not allow it to be published in his lifetime. He did not lack for literary fame, however, his *Apology for Poetry* and *Defence of Poesy*, as well as numerous miscellaneous pieces all distinguished for their beauty of expression and tender sentiment, having won much favour, especially in the circle of the Court. In 1586 he was given a command in the Netherlands and was killed at Zutphen

Siemens, Sir William, F R S (1823–83), a German-born scientist and inventor, chiefly in the field of heat and electricity. Constructed many overland and submarine telegraphs Brother of Werner v Siemens, founder of the famous firm of Siemens-Halske.

Sienkiewicz, Henryk (1846–1916), famous Polish novelist, Nobel prizewinner, 1905 (*Quo Vadis*)

Sikorski, Wladyslaw (1881–1943), Polish general and statesman; Prime Minister during second world war

Simpson, Sir James Young, Bt., F.R.S. (1811–70), the discoverer of the utility of chloroform as an anæsthetic, was a native of Scotland, and was a most accomplished experimental surgeon

Sinclair, Upton (b 1878), American novelist whose documentary novel *The Jungle* about the Chicago slaughteryards caused a sensation in 1906 Made a bold bid for election as Democratic candidate for the Governorship of California in 1934, but was defeated.

Singer, Isaac Meritt (1811–75), American mechanical engineer who devoted himself to the improvement of the early forms of the sewing-machine and patented a single-thread and chain-stitch machine.

Sisley, Alfred (1839–1899), French Impressionist painter of English origin. Painted with great delicacy and sensitivity, landscapes, villages, trees, and rivers. Influenced by Corot and Manet.

Sitwell, Edith (Louisa), D.B.E. (b. 1887), English poet whose works include *Bucolic Comedies*, *Gold Coast Customs* and *Collected Poems*. Her two brothers are **Osbert** (b. 1892), a well-known poet and novelist, and **Sacheverell** (b. 1900), a poet and critic

Slim, Field-Marshal Viscount, K.G., G.C.B., G.C.M.G., G.C.V.O., G.B.E., D.S.O., M.C. (b. 1891), Gov.-Gen. of Australia 1953–59. In 1943 took command of the 14th Army in Burma, later becoming commander of the Allied Land Forces, S.E.A.C., and then Commandant of the Imperial Defence College. In 1947 joined the Railway Executive, but left a year later to succeed Lord Montgomery as Chief of the Imperial General Staff (1948–52).

Sloane, Sir Hans, Bt., F.R.S (1660–1753), was born in County Down, Ireland, but settled in London, and became famed as a physician and naturalist. For some years he held the office of President of the Royal College of Physicians, and was elected President of the Royal Society in succession to Sir Isaac Newton. His Library of 50,000 vols., and treasures in natural history and MSS., worth from £50,000 to £80,000, were offered by his will to, and bought by the nation for £20,000, and with that nucleus the British Museum was founded.

Slowacki, Julius (1809–49), Polish romantic poet. He was a revolutionary, lived in exile and died in Paris. His tragedies include *Kordian*, *Belladyna* and *Lilli Weneda*.

Smeaton, John (1724–92), who rebuilt Eddystone Lighthouse, which had been burned down; he

subsequently constructed many important works in connection with harbours and canals. He was also the inventor of an improved blowing apparatus for iron-smelting.

Smetana, Bedřich (1824–84), Czech composer, creator of a national style. He was principal conductor of the Prague National Theatre, for which he wrote most of his operas, including *The Bartered Bride* and *The Kiss*. Best known of his other compositions are the cycle of symphonic poems *My Country* and the string quartets *From My Life*. He became totally deaf in 1874, suffered a mental breakdown, and died in an asylum.

Smiles, Dr. Samuel (1812–1904), was in early life a medical practitioner; achieved wide popularity by his *Self Help*, a book that has had an enormous sale.

Smith, Adam, F.R.S. (1723–90), the father of the science of political economy. Author of *Theory of Moral Sentiments* and *Wealth of Nations*, which immediately obtained the admiration of the leading men of the day, and secured him the friendship of Gibbons, Hume, Burke, Reynolds, and Dugald Stewart.

Smith, Sir Grafton Elliot, M.A., Litt.D., D.Sc., F.R.S. (1871–1937), Australian anatomist and archaeologist who was professor of anatomy at Manchester and London Universities. His works include *The Royal Mummies* (1912), *Tutankhamen* (1923), *The Evolution of Man* (1924), and the *Diffusion of Culture* (1933).

Smith, Captain John (1580–1631), the noted seafarer and adventurer who in 1605 was the leading spirit of an expedition to Virginia, and founded Jamestown.

Smith, Joseph (1805–44), founder of Mormonism, son of a Vermont farmer. Claimed to have been granted revelation of the *Book of Mormon*, which came to be held as equal in authority and as a necessary supplement to the Scriptures. Smith, who was murdered, was not a polygamist; Brigham Young, who succeeded him, was (*See* **Mormonism, Section J.**)

Smith, Sydney (1771–1845), an Anglican divine, who enjoyed a great reputation as a wit and writer. Founder of and contributor to the *Edinburgh Review* and author of *Peter Plymley's Letters*, supporting Catholic Emancipation.

Smith, William (1769–1839), English surveyor and geologist, the first to map the rock strata of England and to identify the fossils peculiar to each layer.

Smith, William Robertson (1846–94), Scottish biblical scholar whose contributions to the 9th edition of *The Encyclopaedia Britannica* resulted in an unsuccessful prosecution for heresy and led to the modernisation of Scottish theology.

Smollett, Tobias George (1721–71), a famous English novelist and humorist, whose *Roderick Random*, *Peregrine Pickle*, *Count Fathom* and *Humphrey Clinker* abound in fun and genial characterisation, while their pictures of sea-life are inimitable.

Smuts, Field-Marshal Rt. Hon. Jan Christiaan, O.M., C.H., K.C. (1870–1950), South African soldier and statesman, one of the dominating political figures of our century. Born in Cape Colony, studied at Cambridge University, and called to the Bar. Was an outstanding Boer commando leader during the South African War, but afterwards worked for friendship with the British and took office in Botha's Government when the Union was set up in 1910. In the first world war joined the Imperial War Cabinet. As Prime Minister, 1912–24, helped to launch the League of Nations, and more recently was associated with the United Nations. Prime Minister, Foreign Minister and Minister of Defence from 1939 to 1948 when he was defeated at the General Election by the Nationalists under Dr. Malan. He was a keen botanist; Pres. of British Association, 1931. Published *Holism and Evolution* in 1926.

Smyth, Dame Ethel Mary (1858–1944), English composer, the daughter of a general, and a militant suffragette. She studied in Germany, where her most important opera *The Wreckers* was first produced. She also wrote chamber music, a comic opera *The Boatswain's Mate*, and a *Mass in D*.

Snyders, Frans (1597–1657), a great Flemish still-life and animal painter who studied under Breughel.

Soane, Sir John, R.A. (1753–1837), an eminent architect who designed numerous public buildings. By his will he left his museum, library, pictures, etc., for the use of the public, and the house in which he lived at Lincoln's Inn Fields still constitutes the Sir John Soane Museum.

Sobieski, John III. (1624–96), King of Poland from 1674, and heroic defender of his country from Cossacks, Tartars, and Turks.

Socinus, Lælius (1525–62), an Italian Protestant thinker and anti-Trinitarian, founder with his nephew Faustus Socinus (1539–1604), of the Socinian system of theology.

Socrates (470–399 B.C.), Greek philosopher and great intellectual leader, was the son of a sculptor and for some time followed that calling himself, but, having other ambitions, joined the army, and was present at the battle of Potidæa, and also at the battle of Delium, saving the life of Alcibiades in the first, and of Xenophon in the second. Returning to Athens he devoted himself to study and began to exhort the people on public questions and the conduct of life. Socrates wrote nothing himself, but we know of his teachings through the writings of his pupils Xenophon and Plato. In 399 B.C. he was charged with impiety and with corrupting the morals of the young, found guilty, and sentenced to death, events immortalised in Plato's *Apology*, *Crito*, and *Phaedo*.

Soddy, Frederick, M.A., LL.D., F.R.S. (1877–1956), Prof. of Inorganic and Physical Chemistry, Univ. of Oxford, 1919–36. Nobel Laureate in Chemistry 1921. The foundation of the isotope theory was laid by him in Glasgow about 1912 before the physicists became prominent in that field.

Solatov, Alexander (b. 1917), Soviet diplomat, succeeded J. Malik as ambassador to Britain, 1960.

Solon (638–558 B.C.), was one of the Seven Sages of Greece, and became an eminent legislator, after having made a reputation as a poet. Solon's Laws were so highly esteemed that they were adopted by the Romans in the Twelve Tables.

Solyman (1490–1566), the celebrated Ottoman Sultan known as "the Magnificent," who won fame as a conqueror, law-giver, administrator, and patron of learning.

Somerset, 1st Duke of (1506–52), was Protector of England in the early part of the reign of Edward VI., but was deposed from power, tried for felony, and executed. A liberal and tolerant ruler who opposed enclosures and pursued a moderate religious policy.

Sophocles (495–406 B.C.), the famous Athenian dramatist who enjoyed the highest popularity at Athens, and in a contest with Æschylus was crowned the victor. Of the 100-odd plays of Sophocles only seven have survived: *Antigone*, *Electra*, *Œdipus*, *Ajax*, *Trachiniae*, *Philoctetes*, and *Œdipus at Colonus*.

Soult, Marshal Nicolas Jean de Dieu, Duke of Dalmatia (1769–1851), was one of Napoleon's favourite and most capable generals, distinguishing himself in the Swiss and Italian campaigns, and also in the Peninsular War, where he was Wellington's bravest opponent.

Sousa, John Philip (1854–1932), American bandmaster and composer of numerous stirring marches. His father was Portuguese and his mother German.

Soustelle, Jacques, D. ès. L. (b. 1912), French scientist and controversial figure in French politics. As leader of the U.N.R. (Union for a New Republic) he planned and carried through the revolution which brought General de Gaulle back to power in 1958. Dismissed from Government, Feb. 1960.

Southey, Robert (1774–1843), English poet and historian. In 1803 he settled near Keswick to be near Coleridge and became one of the Lake poets. He was made poet Laureate in 1813. His best work was in prose: histories of Brazil and of the Peninsular War; life of Nelson, and biographies of Wesley and others.

Southwell, Robert (1561–95), a famous Jesuit and religious poet of Elizabethan times. Beatified in 1929.

Spaak, Paul-Henri (b. 1899), Belgian statesman; first President of the U.N. General Assembly in 1946 and of the Assembly of the Council of Europe during its first session in 1949. Sec. Gen. of NATO, 1957–61.

Spaatz, General Carl Andrew (b. 1891), American soldier who held high commands in Europe, North Africa, and the Pacific, 1942–46.

Spartacus, a Thracian who became a Roman slave and gladiator in Capua, and headed an insurrection in Italy in 73 B.C. The slaves he raised routed several Roman armies, but he was eventually defeated by Crassus in 71 B.C. and slain.

Speke, Capt. John Hanning (1827–64), was the discoverer, along with Lt.-Col. J. A. Grant, of the Kagera, the main source of the White Nile, in 1862. In 1856 he discovered Lake Tanganyika and in 1858 Victoria Nyanza.

Spence, Sir Basil, O.M. (b. 1907), architect of the new Coventry cathedral, the new university of Sussex, Glasgow air terminal, Hampstead civic centre, and the new British embassy in Rome. Prof. of Architecture, Royal Academy.

Spencer, Herbert (1820–1903), was the son of a Derby schoolmaster. For some time followed the profession of civil engineer. His first book was published in 1851, under the title of *Social Statics*, when he was filling the position of sub-editor of the *Economist*. In 1855 his *Principles of Psychology* appeared, in which he seems to have anticipated Darwin's theory of Evolution. The *System of Synthetic Philosophy* began to appear in 1860, and the last of its ten volumes was issued in 1896.

Spencer, Sir Stanley, C.B.E., R.A. (1891–1959), British artist whose work shows great visionary and spiritual power. His paintings include the Resurrection pictures and the Cookham Regatta series.

Spenser, Edmund (1552–99), was born in London, educated at Cambridge, and early attracted notice by his poetic writings. After the publication of his *Shephearde's Calendar*, he was made known to Queen Elizabeth, and in 1580 received the appointment of Secretary to the Lord Deputy of Ireland, and in the division of confiscated lands that afterwards took place, Spenser received Kilcolman Castle and 3,000 acres of land. Here he wrote his *Faerie Queene*. In 1598 a rebellion broke out, and Spenser's castle was burned to the ground. He then returned to London, and there died.

Spinoza, Baruch or Benedict (1632–77), one of the greatest of modern philosophers, was born at Amsterdam, the son of a Portuguese Jew who had settled there as a merchant. He had a sceptical turn of mind and having expounded philosophical doctrines antagonistic to Judaism, was excommunicated by the rabbis as a heretic. He owed much to Descartes and in 1663 published his work on the Cartesian philosophy. The attainment of truth was his one object in life. Indifferent to money, he spent his life in study and earned his living as a lens grinder. His writings have had an extensive and enduring influence though during his lifetime some of his works, including his *Ethics*, were not allowed to be published.

Spofforth, Reginald (1770–1827), a writer of glees, including *Hail, Smiling Morn*.

Spurgeon, Rev. Charles Haddon (1834–92), a renowned Baptist who preached at The Tabernacle, near the Elephant and Castle, London, from 1861 until his death.

Staël, Madame de (Anne Louise Germaine Necker, Baronne de Staël-Holstein) (1766–1817), the daughter of Necker, the famous Finance Minister under Louis XVI., was married to Baron de Staël (Swedish Minister) at twenty. She was a brilliant woman, deeply imbued with philosophical sentiments. Two years after her marriage she made a considerable impression by her *Letters on Rousseau*, and was regarded as in sympathy with the Revolution. Later on, however, she was in disfavour, first with the Revolutionary leaders, and then with Napoleon, and was in turn exiled by both and during this time wrote *Corinne* and other able works.

Stalin, Generalissimo Joseph Vissarionovich (Djugashvili) (1879–1953), Soviet statesman who for nearly thirty years was leader of the Russian people. Studied for the priesthood at the Tiflis theological seminary. From the age of 17 was an active revolutionary and took important part in the civil war after 1917. After the death of Lenin became the outstanding figure in Russia and his aim to make Russia a great industrial power was carried into effect by modernizing agriculture on socialist lines and by a series of five-year plans, the first of which was introduced in 1929. Assumed military leadership against the German invasion, June 1941. Attended the Allied war conferences at Teheran, Yalta, and Potsdam. The denunciation of Stalin and the "personality cult" by M. Khrushchev at the Soviet Communist Party Congress in Feb. 1956 has led to profound and far-reaching political consequences in other Communist countries.

Stanford, Sir Charles Villiers, Mus. D. (1852–1924), Professor of Music at Cambridge University, and Professor of Composition and Orchestral Playing in the Royal College of Music. An organist and conductor of remarkable ability, and a composer of much fine instrumental choral, operatic, and other music.

Stanley, Sir Henry Morton, G.C.B., (1841–1904), English explorer, after an adventurous early career during which he fought for the Confederates in the American Civil War, joined the *New York Herald* as a correspondent in 1867 and was commissioned by Gordon Bennett to search for Livingstone. In 1871 he discovered the great missionary at Ujiji and with him explored the northern end of Lake Tanganyika. After further exploration he founded the Congo Free State in 1879. Among his books were *How I found Livingstone, Through the Dark Continent, In Darkest Africa*, and an *Autobiography*.

Steele, Sir Richard (1672–1729), b. in Dublin, founder of *The Tatler*, which made a great hit, his friend Addison contributing many papers. Two years later he and Addison were associated in *The Spectator*, Addison however, being the leading contributor; the *Guardian* was another of Steele's ventures. He sat in Parliament for some time, and was knighted by George I.

Steer, Philip Wilson, O. M. (1860–1942), was the most distinguished of British landscape painters, and a fine portraitist.

Stefansson, Vilhjalmur (b. 1879), a famous Arctic explorer, born in Manitoba of Icelandic parents. Took part in the Anglo-American (1908–12) and Canadian (1913–18) Arctic expeditions.

Stein, Sir Aurel, K.C.I.E. (1862–1943), was a famous British archæologist who conducted expeditions, chiefly to Chinese Turkestan, resulting in priceless additions to the British Museum and the Delhi Central Indian Museum. Explored Baluchistan, 1926–28, and South Iran 1932–33. Was Superintendent of Archæological Survey, North-West Frontier Circle, India, 1910–29.

Stendhal, *nom de plume* of the French novelist, **Marie Henri Beyle** (1783–1842), who has been an important influence in the development of the French novel and whose books show searching psychological insight. Best known for his two novels, *Le Rouge et le Noir*, and *La Chartreuse de Parme*.

Stephen (1105–54) was King of England from 1135 to his death, usurping the crown that belonged to Matilda, the daughter of Henry I.

Stephen Sir Leslie, K.C.B. (1832–1904), an eminent writer, critic and biographer. Edited the *Cornhill Magazine* (1871–82), and the *Dictionary of National Biography* (1882–91). He was the father of Mrs. Virginia Woolf.

Stephenson, George (1781–1848), was born at Wylam, near Newcastle, and up to 1804 was mainly engaged in ordinary colliery occupations. In 1804, however, an engagement as brakesman at Killingworth colliery brought him in touch with the working of Watt's steam engine, and his first efforts in invention were in improving one of those engines, showing so much ability that he was offered an enginewright's position at Killingham, which he held for some time. Then it was that he began to think seriously of producing a locomotive engine, and managed to construct an engine that would draw coal trucks at the rate of four miles an hour. In 1821, when the Stockton and Darlington Railway was undertaken, he was appointed engineer, and when the railway was opened in 1825, as a line for the transport of coal only, Stephenson won his first great triumph, by putting a locomotive on the line that was able to draw a train of thirty-eight carriages, laden with goods and passengers, at a rate of twelve miles an hour. George Stephenson, subsequently, assisted by his son Robert,

constructed the Liverpool and Manchester line, and after that the railway era commenced.

Stephenson, Robert, F.R.S. (1803–59), the only son of George Stephenson, attained great eminence as a civil engineer, constructing numerous important railways and bridges, being designer and contractor for the High Level Bridge at Newcastle, the Menai and Conway Tubular Bridges, the Victoria Bridge across the St Lawrence at Montreal, and two notable bridges over the Nile.

Sterne, Laurence (1713–68), British humourist whose *Tristam Shandy* (1759–67) brought him fame He also wrote *The Sentimental Journey* and published some volumes of sermons

Stevenson, Adlai Ewing (b 1900), American lawyer and politician; Ambassador to U N , 1960– ; Gov. of Illinois, 1949–53, Democratic candidate for Presidency, 1952 and 1956.

Stevenson, Robert, F.R.S E (1772–1850) a native of Glasgow, and famed as a builder of lighthouses, including that on Bell Rock He also invented the "flashing" system of throwing light at sea.

Stevenson, Robert Louis (1850–94), was the Scottish author of a remarkable series of essays, stories, and poems, including *Travels with a Donkey, Virginibus Puerisque, Treasure Island, Kidnapped, Dr Jekyll and Mr Hyde,* and *A Child's Garden of Verses* He always suffered from delicate health and travelled extensively, finally settling in Samoa with his Californian wife, formerly Mrs Osbourne His literary influence was considerable, particularly on the generation which followed him

Stinnes, Hugo (1870–1924), German industrialist who built up a huge coal-mining, iron and steel, and transport business, and also developed a large shipping concern His group controlled the greater part of Germany's coal, iron and steel supply. In 1920 he entered the Reichstag, and later became a newspaper proprietor

Stirling, Elizabeth (1819–95), English organist whose recitals in London exercised much influence and made Bach's music more widely known. She wrote the part-song "All among the barley."

Stoker Bram (Abraham) (1847–1912), b in Ireland, author of *Dracula* and *Personal Reminiscences Of Henry Irving,* which records his association with the actor in managing the Lyceum Theatre

Stokes, Sir George Gabriel, L L D , F.R S (1819–1903), Irish mathematician and physicist, Prof of Mathematics at Cambridge from 1849, served as Sec (1854–85) and as Pres (1885–92) Royal Society, and as Pres British Association (1869) Renowned for his researches in hydrodynamics and the theory of light.

Stopes, Marie Carmichael, D.Sc , Ph D , F L S , F.R L S (1880–1958), woman scientist who published many works on birth control

Stowe, Harriet Elizabeth Beecher (1811–96), authoress of *Uncle Tom's Cabin* which exposed the horrors of slavery and did much to advance the cause of abolition

Strachey, Rt Hon. Evelyn John St. Loe (b 1901), Labour M P for Dundee West Writer of lucid and vigorous books on the principles of democratic socialism which include *Contemporary Capitalism, The End of Empire,* and *On the Prevention of War*

Stradivari, Antonio (1644–1730), an Italian maker of violins, first in his art in the world of all time

Strafford, Thomas Wentworth, Earl of (1593–1641), the distinguished statesman, sent by Charles I. to Ireland as Lord Deputy in 1631. Was the founder of the Irish linen manufacture He obtained the name of "Thorough" by his sweeping measures for asserting the King's authority, but was ultimately impeached on a variety of charges, found guilty, and executed.

Strauss, David Friedrich (1808–74), German theological writer, who made a great stir in the religious world by his *Life of Jesus,* published in 1835, which attempted to prove that the evangelical history mainly rested on a series of myths.

Strauss. Family of Viennese musicians. **Johann Strauss** (1804–49), "the elder," was a composer of dance music who with Joseph Lanner established the Viennese waltz tradition. His son, **Johann Strauss** (1825–99), "the younger," although not so good a violinist or conductor as his father, is the more famous as the composer of over 400 waltzes, which include *The Blue Danube* and *Tales from the Vienna Woods.* Two of his brothers **Joseph Strauss** (1827–70) and **Eduard Strauss** (1835–1916) were also composers and conductors.

Strauss, Richard (1864–1949), German composer and conductor, the son of a horn player in the opera orchestra at Munich. He succeeded von Bülow as court musical director at Meiningen. Among his compositions which are widely acclaimed are the operas *Salome, Elektra,* and *Der Rosenkavalier,* the symphonic poems *Don Juan, Till Eulenspiegel,* and *Don Quixote,* and many songs of great lyrical beauty.

Stravinsky, Igor (b 1882), Russian composer and conductor, pupil of Rimsky-Korsakov. His early ballets *The Fire Bird* and *Petrushka* (regarded by some as his greatest work) were commissioned by Diaghilev and are representative of his early romantic style. *Pulcinella, Apollon musagète, Persephone,* and the opera *Oedipus Rex* are later works in his neo-classical style Younger composers have been much influenced by his music. He became a French citizen in 1934, and a U.S. citizen in 1945.

Strindberg, Johan August (1849–1912), Swedish writer of intense creative energy. His work is subjective and reflects his personal conflicts. He married three times but never happily. He produced some fifty-five plays as well as novels, stories, poems, and critical essays. *Lucky Peter, Gustav Adolf, Till Damascus, The Father, Miss Julie* are some of his plays

Strong, Leonard Alfred George (1896–1958), poet, novelist, short story writer, and critic. Author, among other books, of *Dublin Days, The Brothers,* and *The Last Enemy,* and with Cecil D. Lewis editor of *A New Anthology of Modern Verse.*

Stuart, Arabella (1575–1615), daughter of the Earl of Lennox and cousin of James I , whose next heir she was both to the English and Scottish thrones In 1610 she married William Seymour, afterwards Earl of Hertford and Duke of Somerset, and thereby incurring the king's displeasure, she was incarcerated in the Tower of London, where she died insane.

Suckling, Sir John (1609–42), wit, courtier, and poet, served under Gustavus Adolphus and in Charles I's first Scottish war (1639) Being concerned in a plot to rescue the Earl of Strafford from the Tower, he fled to France, where he may have killed himself He wrote poems, ballads songs, and prose work and is said to have invented cribbage

Sudermann, Hermann (1857–1928), German dramatist, poet and novelist. His brilliant novel, *Frau Sorge* (1887), translated into English as *Dame Care* (1892), reached its 125th edition in 1912 From 1890 he produced a succession of realistic plays and novels

Sukarno, Achmed (b. 1901), President of Indonesia since 1945

Sullivan, Sir Arthur Seymour, C.V.O (1842–1900), gifted composer, gained his first musical experiences as choir-boy at the Chapel Royal, and later studied at Leipzig. He composed oratorios but at the same time cultivated a lighter vein with pronounced success. Became famous for the light operas written in collaboration with W S Gilbert, which include *Trial by Jury, The Sorcerer, H M S Pinafore, Pirates of Penzance, Patience, The Mikado, The Yeomen of the Guard, The Gondoliers.*

Sully, Maximilien de Béthune, Duc de (1560–1641), a French Protestant statesman, a friend and companion of Henry of Navarre. His *Memoirs* made notable reading.

Sun Yat Sen, Dr. (1867–1925), the founder and first President of the Chinese Republic, 1912, resigning almost immediately in favour of Yuan Shih Kai. Was the first graduate of medicine at Hongkong, 1891. Founded in 1905 the China Revolutionary League in Europe and Japan, and played a large part in the revolution of 1911, being elected President of the Southern provinces by the Nanking Convention in 1912.

Sutherland, Graham Vivien, O M. (b. 1903), British artist; he painted the 80th birthday portrait of Sir Winston Churchill commissioned by Parliament and designed the vast tapestry for Coventry Cathedral.

Sutro, Alfred (1863–1933), author and dramatist.

His most successful plays were *The Walls of Jericho* (1904) and *John Glayde's Honour* (1907).

Swedenborg, Emanuel (1689–1772), Swedish philosopher, scientist, mystic. In later life he announced that Divine authority had been given him to explain natural and spiritual evidences. He published in quick succession *Arcana Coelestia*, *The Apocalypse Revealed*, *Four Preliminary Doctrines*, and *The True Christian Religion*. He also claimed that his soul had been permitted to travel into hell, purgatory and heaven. His works became the scriptures of the sect named Swedenborgians.

Sweelinck, Jan Pieterszoon (1562–1621), famous Dutch organist and composer of sacred music. In his fugues he was the first to make independent use of the pedals, and thus prepared the way for Bach.

Swift, Jonathan Dean (1667–1745), was born at Dublin, educated at Trinity College at the expense of an uncle, became secretary to Sir William Temple, and looked for political preferment, but it did not come. Entering the Church, he was made Dean of St. Patrick's in 1713. Getting entangled in political controversy, and changing his views from the Whig to the Tory side, he lost favour with the popular party, but consoled himself with a devotion to literature, which he greatly enriched by some powerful satires, poems and discourses. *Gulliver's Travels*, *A Tale of a Tub* and *The Battle of the Books* are among the best-known works. His romantic attachment to "Stella" (Hester Johnson, whom he is believed to have married privately) and "Vanessa" (Esther Vanhomrigh), and their devotion to him, are familiar stories.

Swinburne, Algernon Charles (1837–1909), was educated at Oxford, and in the early 'sixties of last century gave to the world a number of poems of singular poetic beauty and musical charm, which procured him a high rank among English poets. Swinburne's most famous productions include *Atalanta in Calydon*, *Songs before Sunrise*, *Bothwell*, and *Mary Stuart*. Perhaps the best of his writings is his essay on William Blake.

Swithin, St. (*circa* 800–862), Bishop of Winchester in 852, and on the translation of his remains to a shrine in the interior of the cathedral from the graveyard, fixed for July 15th, 971, violent rain intervened, and, it is said, continued for forty days; hence the superstition as to rain upon St Swithin's Day.

Symonds, John Addington (1840–93), acquired fame as a poet and writer on *The Renaissance Period in Italy*.

Synge, John Millington (1871–1909), Irish poet and playwright. His best known work, *The Playboy of The Western World*, met with a hostile reception when first produced in Dublin in 1907, but English audiences were at once enthusiastic.

Szigeti, Joseph (b. 1892), famous Hungarian violinist, who made his début in 1905, toured through Europe and settled for some years in England. He made an immense reputation on the Continent, and was Prof. at the Geneva Conservatorium, 1917–24.

Szymanowski, Karol (1833–1937), Polish composer and director of the Conservatoire at Warsaw.

Tacitus, Caius Cornelius (55–*circa* 120). His chief claim to remembrance is that he was one of the ablest of Roman historians, and left behind him a number of works; among them a life of Agricola and his *Annales*, which have formed the ground-work of much that has since been written on the period he covered.

Tacitus, Marcus Claudius (205–276), the Roman Emperor who succeeded Aurelian in A.D. 275. His short reign was wise and marked by moderation.

Taft, Wm. Howard (1857–1930), Chief Justice United States 1921–30. President of the United States 1908–12.

Tagore, Rabindranath (1861–1941), a Bengal poet who won the Nobel Literature Prize in 1913.

Talbot William Henry Fox, F.R.S. (1800–1877), English scientist who first discovered the principles of photography in 1833. Inventor of the calotype or Talbot-type process of which modern photography is a development.

Talleyrand-Périgord, Charles Maurice de (1754–1838), French politician and diplomat, led a mission to England in 1792 and was Foreign Minister from 1797 until 1807. He represented France at the Congress of Vienna.

Tallis, Thomas (*c.* 1510–85), a distinguished musician, who was, as organist, attached to the Chapel Royal under Henry VIII., Edward VI., Mary, and Elizabeth, and was the composer of some of the finest of our Church music.

Tamerlane or **Timur Lenk** (= **Timur the Lame**) (1336–1405), Mongol conqueror who turned his energies from deliverance of his people from barbarism to military conquest for its own sake. He made himself ruler of Samarkand in 1369 and in a series of campaigns conquered Iran, Transcaucasia, Iraq, Armenia and Georgia, invaded India and Syria, and defeated the Ottoman Turks at Angora. While preparing for the invasion of China death overtook him. His reputation is that of a ruthless and cruel conqueror who showed no mercy even to his fellow Moslems, but he was also a patron of literature and the arts. The Timurids are the line of rulers descended from him.

Tannhäuser, a mythical German minnesinger of the 13th century, who belonged, according to the legend handled so romantically in Wagner's opera, to the Salzburg family of Tanhusen, and was the beloved of Lisaura.

Tarkington, (Newton) Booth (1869–1946), American novelist whose best-known book is *Monsieur Beaucaire*, a sentimental romance which he successfully dramatised.

Tarquin Superbus (or "**the Proud**"), the last King of Rome. Was banished 510 B.C. After his deposition came the Consuls.

Tarquin the Elder, 5th King of Rome, succeeded Ancius Mastius 615 B C., reformed the laws, embellished the city, and was assassinated.

Tartini, Giuseppe (1692–1770), great violinist and anticipator of romanticism in Italian music. In practising double stops he discovered a differential tone which modified the intonation—becoming known as Tartini's or "the third" tone—a scientific explanation of which was later given by Helmholtz. His best-known sonata is *The Devil's Trill* written after a dream in which the devil played to him.

Tasman, Abel Janszoon (*circa* 1602–59), a famous Dutch navigator, in 1642 he discovered the island of Tasmania and New Zealand shortly thereafter.

Tassigny, Jean de Lattre de, Marshal of France, Hon G C B (1890–1952), outstanding commander of the Free French Movement in Second World War, High Commissioner and C-in-C. Indo-China, 1950–52. C.-in-C. Land Forces, Western Europe, 1948–50.

Tasso, Torquato (1544–95), one of the great Italian epic poets, author of *Jerusalem Delivered* (Ital. *Gerusalemme liberata*) which celebrates the First Crusade.

Tawney, Richard Henry, B A (1880–1962), great historian, pioneer of adult education, leader of socialist thought, the first critic of the affluent society; Prof Emeritus Economic History, Univ. of London, 1931–49. Among his standard works are *The Acquisitive Society*, *Equality*, *Religion and the Rise of Capitalism*.

Taylor, Jeremy (1613–67), an English divine of great influence. The most famous of his works was his *Holy Living and Holy Dying*.

Tchaikovsky, Peter Ilich (1840–93), Russian composer. His music is melodious and intensely emotional and he excelled in several branches of composition. Amongst his works are ten operas, including *Eugene Onegin* and *The Queen of Spades* (both from stories by Pushkin), six symphonies, including the *Little Russian* and the magnificent *Pathétique*, his last completed work, ballets, including *Swan Lake*, *The Sleeping Beauty*, and *The Nutcracker*, the fantasies *Romeo and Juliet* and *Francesca da Rimini*, the piano concerto in B flat minor, the violin concerto in D, and numerous songs.

Tedder, Marshal of the R.A.F., Arthur William, 1st Baron, G.C.B., B.A. (b. 1890), was Deputy Supreme Commander under Eisenhower for the invasion of Europe, Chief of the Air Staff, 1946–48; Chairman, Western Europe Chiefs of

Staff committee, 1948–50; Vice-Chairman of the Governors of the B.B.C., 1952–54; Chancellor Univ. of Cambridge, 1950

Telemann, Georg Philipp (1681–1767), composer of great facility and output in all fields of music. Founded Collegium Musicum at Leipzig Univ. and held appointments in many other German towns, including Hamburg. His music has vitality and originality of form and is appreciated today after long period of neglect.

Telford, Thomas (1757–1834), was a Scottish working stone-mason who became a great engineer and attained special fame as a builder of bridges, the Menai Suspension Bridge being, perhaps, his greatest work He constructed the Ellesmere Canal, made many hundreds of miles of difficult mountain roads, was chief engineer of the Caledonian Canal, and altogether did an immense amount of public work

Tell, William, a legendary figure in Swiss folk-lore. The story of his having been compelled by order of the imperial governor, Gessler, to shoot an apple from the head of his own son and his dramatic revenge is regarded as a legendary feat which has its origins in Teutonic myth. The Swiss hero of the Uri, however, played a great part in freeing his country from the Austrian yoke in the early part of the 14th century.

Temple, Most Rev. Frederick (1821–1902), a famous Anglican Churchman who became Headmaster of Rugby in 1858; in 1860 attained notoriety as the author of the first of the much-controverted *Essays and Reviews*, advocated the disestablishment of the Irish Church in 1868, was appointed Bishop of Exeter in 1869, translated to London in 1885, and in 1896 was raised to the Primacy He made a strong Archbishop, and dominated the Church with his vigorous personality

Temple, Most Rev. William, P.C , D Litt , D D (1881–1944), one of the outstanding Christian leaders of his time and the son of Frederick Temple, was Archbishop of Canterbury, 1942–44, after being Headmaster of Repton, 1910–14, Bishop of Manchester, 1921–29, and Archbishop of York, 1929–42 His influence was felt among Christians of all denominations, and he strove for the unity of the Churches.

Temple, Rt. Hon. Sir William, Bt. (1628–99), English statesman and author. Ambassador to The Hague in Charles II 's time, and instrumental in bringing about the marriage between William of Orange and the Princess Mary. William III twice offered him the position of Secretary of State, but he declined the honour, spending the years of his retirement at Moor Park (where Swift served him for a time as private secretary) Married **Dorothy Osborne** (1627–95), the letter-writer.

Templewood, Samuel John Gurney Hoare, 1st Viscount, P C , G C S I , G B.E , C M G, (1880–1959), Conservative politician; Sec. of State for Air, 1922–29, Sec of State for India, 1931–35; Foreign Sec , June–Dec 1935; Home Sec , 1937–39; Special Ambassador to Spain, 1940–44.

Teniers, David (the younger) (1610–94), was born at Antwerp, and his paintings of the old rustic Flemish life are unsurpassed in their humour and fidelity. He died at Brussels His father, **David Teniers the elder** (1582–1649), was also one of the leading landscape painters of the time.

Tenniel, Sir John (1820–1914), for over fifty years leading artist of *Punch*, illustrated numerous books, including *Alice in Wonderland*

Tennyson, Alfred Lord (1809–92), was Poet Laureate from 1850 to his death Born at Somersby, in Lincolnshire, he showed poetic gifts while quite young, and in 1827, joined his brother Charles in the publication of *Poems by Two Brothers*. In 1847 he published *The Princess*; in 1850 *In Memoriam*, a poem of great beauty and depth of thought, in which he enshrined his affection for the memory of his dead friend Arthur Hallam; and in 1855 *Maud* appeared. His other works include *The Idylls of the Kings*, *Enoch Arden*, *Queen Mary*, *Harold*, and *Becket*.

Terence, Publius Terentius Afer (c. 184–159 B.C.), a Latin poet and dramatist, an African (Berber), who rose from the position of a slave to that of one of the most honoured men in Rome.

Teresa, St., or Theresa (1515–82), a Spanish saint and author, born at Avila, entered the Carmelite order in 1534, established a reformed order in 1562, became famous for her ascetic life and mystic visions, and died at Alba de Liste. Her religious writings include *The Way of Perfection* and *The Castle of the Soul*. She was canonised by Pope Gregory XV

Terry, Dame Ellen, G B.E. (**Mrs. James Carew**) (1848–1928), one of the most distinguished of English actresses. Played Shakespeare with Sir Henry Irving at the Lyceum and later appeared in plays of Bernard Shaw.

Tertullian, Quintus (*circa* 150–230), a Father and writer of the Latin Church. His chief work was his *Apologeticus*, a defence of Christianity

Tetrazzini, Luisa (1871–1940), an Italian prima donna who sprang into prominence in 1907 by her wonderful singing at Covent Garden and hailed as a second Patti

Tetzel, John (c. 1460–1519), the German Dominican monk and Inquisitor, the scandal of whose sale of indulgences roused Luther to publish his ninety-five theses at Wittenberg in 1517.

Thackeray, William Makepeace (1811–63), English novelist, author of *Vanity Fair*, *Pendennis*, *Esmond*, *The Newcomes*, *The Virginians*, *Philip* and *Lovel the Widower*. He edited the *Cornhill Magazine* from the first number, January, 1860, for a few years his most notable contributions being his *Roundabout Papers*. His *Yellowplush Papers* and *The Book of Snobs* (republished from *Punch*) were widely read and admired, and the lectures he delivered in America on *The Four Georges* were pungently powerful

Thales of Miletus (c 624–565 B C.), earliest of the Greek scientists, he created a sensation by his prediction of an eclipse of the sun, which was visible at Miletus in 585 B C He looked upon water as the basis of all material things and in his mathematical work was the first to enunciate natural laws.

Thant, Sithu U (b 1909), Secretary-General of the United Nations, 1962– , Acting Sec -Gen. after Dr Hammarskjold's death in 1961, Burmese Perm Rep to U N 1957–61

Themistocles (c 514–449 B C), Athenian soldier and statesman. By fortifying the harbour of Piræus as the port of Athens, by the remission of taxes on aliens, and by the creation of the Athenian navy, he established Athenian prosperity and made possible the later Athenian empire. Defeated the Persian fleet at Salamis in 480 B C.

Theocritus (285–247 B C), one of the great Greek poets Thirty *Idylls* have come down to us and a number of *Epigrams*.

Theodoric the Great (455–526), a celebrated King of the East Goths, born at Pannonia. In mediæval German romance he is known as "Dietrich von Bern," and had a reputation for good government, akin to that ascribed in England to King Alfred He was the founder of the Gothic Kingdom of Italy

Theodosius the Great (346–95) was Roman Emperor of the East for nearly twenty years. He gained victories over the Goths, and the year before his death became sole Emperor. Noted in ecclesiastical history for his conversion to Christianity, and for his submission to the penance imposed by St. Ambrose.

Theophrastus (c. 372–287 B C), succeeded Aristotle as President of the Lyceum at Athens. His *History of Plants* and his *Moral Characters* are the best known of his writings.

Thibaud, Jacques (1880–1953) famous French violinist. Killed in aeroplane crash.

Thierry, Jacques Nicolas Augustin (1795–1856), a distinguished French historian, known by his *History of the Norman Conquest*.

Thiers, Louis Adolphe (1797–1877), a French statesman and man of letters, author of *History of the French Revolution*.

Thomas, Dylan (1914–53), Welsh poet whose *Eighteen Poems* (1934) brought him instant recognition as an original and gifted artist. Other works include *Twenty-five Poems* (1936), *Deaths and Entrances* (1945), *Under Milk Wood*, a play for voices

Thomson, James (1834–82), a Scottish poet who wrote *The City of Dreadful Night*.

Thomson, Sir (John) Arthur (1861–1933), was a well-known biologist.

Thomson, Sir Joseph (John), O.M., D.Sc., F.R.S.

(1856–1940), physicist and mathematician; Master of Trinity College, Cambridge, 1918–40; Cavendish Prof of Experimental Physics, Cambridge, 1884–1919. Awarded Nobel Prize in 1906 for his work on conduction of electricity through gases; also discovered the electron. Wrote learnedly on electricity, magnetism, radio-activity, etc. His son, **Sir George Paget Thomson,** (b. 1892) F.R.S., is also a physicist and Nobel Prizeman; Master of Corpus Christi College, Cambridge.

Thoreau, Henry David (1817–62) was a natural philosopher and nature-worshipper, who forsook trade and devoted himself to a primitive kind of existence in the American woods. He was the friend of, and for a time lived with, Emerson, but in 1845 adopted his career of solitude, and pursued those studies of nature which afterwards gained him a high reputation. His *Walden, or Life in the Woods,* is a unique book.

Thorez, Maurice (b. 1900), Secretary General of the French Communist Party.

Thorndike, Dame Sybil, D.B.E., LL.D. (b. 1885), a celebrated British actress. She had a great success in *Macbeth,* also in G B. Shaw's *St. Joan* and in several Greek tragedies. Wife of Sir Lewis Casson, the actor

Thornycroft, Sir William Hamo, R A. (1850–1925), English sculptor whose works include the Gladstone Memorial, the statue of General Gordon in Trafalgar Square, of Queen Alexandra in the Royal Exchange, Lord Granville in the Houses of Parliament, Cromwell at Westminster, and John Bright in Rochdale.

Thorpe, Sir (Thomas) Edward, C.B., Ph.D., D Sc, F R.S (1845–1925), a noted English chemist. His chief research work was done on paraffin hydrocarbons, and the derivatives of fluorine and phosphorus Was the author of a standard *Dictionary of Applied Chemistry* and a *History of Chemistry.*

Thorwaldsen, Bertel (1770–1844), a famous Danish sculptor.

Thucydides (c. 460–399 B.C), the first scientific historian, was an Athenian and took part in the Peloponnesian War, about which he wrote his *History.* Attempted an impartial account, weighing the testimony of eye-witnesses and keeping to carefully verified facts The *History* is a graphic narrative, but Thucydides was not merely a chronicler; he saw the general significance of particular events and wished to pass on the political lessons of the past to the future. The speeches which he put into the mouths of the various actors reveal the political ideas and climate of opinion of contemporary Greece, and include the famous Funeral Oration of Pericles.

Tiberius, Claudius (42 B C–A D 37), the second Emperor of Rome, had an evil reputation but was an able ruler and successful soldier. Spent his later years in Capri.

Tillett, Benjamin (1860–1943), M.P. for North Salford 1917–24 and again 1929–31, came into prominence in the great dock strike of 1889 He was the organiser and secretary of the Dockers' Union; for several years alderman of the L.C C.; and an active labour leader. Chairman of the General Council T.U.C 1928–29.

Tillotson, John (1630–94), a celebrated preacher at Lincoln's Inn, "Popery" and "Atheism" being the main objects of his attacks: in 1691 became Archbishop of Canterbury.

Tindal, Matthew (c. 1653–1733), noted English Deist.

Tintoretto (1518–94), Venetian painter whose aim it was to unite the colouring of Titian with the drawing of Michelangelo. He is among the most original and decorative of artists whose numerous paintings, mostly of religious subjects, were executed with great speed, some of them on enormous canvasses. His real name was Jacopo Robusti, and he was called Il Tintoretto (little dyer) after his father's trade. Three of his six children were painters.

Titian, or Tiziano Vecelli (1477–1576), one of the greatest of painters. He studied under the Bellinis, and made his first essays in painting for the public in conjunction with Giorgione, whom he soon surpassed. In 1511 he was at Padua, where he painted some notable frescoes; in 1512 he was back in Venice, with a studio on the Grand Canal, employed on important commissions. From this time forward he was in great demand, and exercised his marvellous powers almost to the end of his life, dying of the plague at ninety-nine.

Titiens (or Tietjens), Teresa (1831–77), a famous German operatic prima donna and concert-room singer.

Tito, Marshal (Josif Broz) (b 1892), Prime Minister of the Federal People's Republic of Yugoslavia since 1945. Leader of the partisan forces which successfully fought against German occupation. President National Liberation Committee, 1943.

Titov, Herman Stepanovich (b 1935), the second Soviet airman to make a cosmic voyage Launched in the spaceship *Vostok II* on August 6, 1961, he orbited the earth more than 17 times in 25 hours, and landed back near Moscow.

Titus (40–81), the Roman Emperor, and son of Vespasian. Attained great renown by his successful part in the Jewish war which terminated in the capture and destruction of Jerusalem he was deemed a profligate and a tyrant, but no sooner was he in sole power than he exerted himself to the utmost to please the people, completed the Colosseum, built splendid baths, and otherwise made himself popular

Tizard, Sir Henry Thomas, G C.B, F R S. (1885–1959), scientist and administrator; Pres British Association, 1948 Played important part in the higher scientific direction of the second world war and as Chair Advisory Council on Scientific Policy, 1947–52

Tocqueville, Alexis, Comte de (1805–59), author of *De La Démocratie en Amérique* and *De L'Ancien Régime,* which set out nineteenth-century liberal ideas.

Todd, Alexander Robertus, 1st Baron, D Sc, F R.S (b 1907), Prof. of Organic Chemistry at Cambridge, 1944– , Chair. Advisory Council on Scientific policy, 1952– , Won Nobel Prize in 1957.

Tolstoy, Count Leo Nikolayevitch (1828–1910), was the most distinguished personality in modern Russian literature. Born of a good family, he was for a time in the army, but was so greatly moved by the trials and sufferings of the people that, out of pure sympathy of heart, he was impelled "to take up his pen and write." At twenty-four he published his *Childhood,* and in 1854, while in camp in the Crimea, wrote his *Tales from Sebastopol,* which procured him considerable literary fame Later on he was a persistent advocate of progressive ideas, and, before the Emancipation Act for freeing all Russian serfs was enforced, he himself had given the serfs on his own estate their freedom In 1862 he married, and settled down to a quiet country life, shortly afterwards publishing his *War and Peace* and *Anna Karenina* In his latter years Tolstoy developed a sort of religious mysticism. Among his later works are *The Power of Darkness, The Kreutzer Sonata, The Cossacks, Resurrection,* and *The End of the Age*

Tooke, John Horne (1736–1812), English politician and pamphleteer, was a supporter of Wilkes and later Pitt. His tracts advocated reform. After the French Revolution was tried for high treason, but was acquitted.

Toole, John Lawrence (1832–1906), for half a century a popular English comedian

Torquemada, Tomás de (1420–98), the chief officer of the Spanish Inquisition.

Torricelli, Evangelista (1608–47), Galileo's pupil. He invented the barometer and improved both the microscope and the telescope.

Toscanini, Arturo (1867–1957), famous Italian conductor, La Scala Theatre, Milan, 1898–1908, and 1920–29, at the Metropolitan Opera House, New York, 1908–15; and of the Philharmonic Symphony Society of New York, 1926–36. Returned to Milan in 1946 after a ten-year exile.

Toulouse-Lautrec, Henri de (1864–1901), French painter, whose pictures portray with stark realism certain aspects of Parisian life in the nineties.

Tovey, Sir Donald Francis (1875–1940), pianist and composer who for 25 years held the chair of music at the University of Edinburgh Outstanding among his many writings is *Essays in Musical Analysis,* and his compositions include chamber music, a piano concerto, and an opera *The Bride of Dionysus.*

Toynbee, Arnold (1852–83), after graduating at

Oxford, devoted himself to practical philanthropy and social reform. From his self-denying efforts sprang the settlement in East London —Toynbee Hall

Toynbee, Arnold Joseph, C.H., Hon D Litt. (Oxford, Cambridge, and Birmingham) (b. 1889), eminent scholar and historian, nephew of above. Dir. of Studies Royal Inst of Int. Affairs, 1925–55. Major work *A Study of History*.

Trajan (*circa* 52–117) was Roman Emperor from 98 to his death. His rule was enlightened, and he was esteemed by his people.

Tree, Sir Herbert Beerbohm (1852–1917), the London actor-manager who scored successes at the Haymarket and His Majesty's Theatre

Trenchard, Marshal of the R.A.F., Viscount, G.C.B, O.M., G.C.V.O., D.S.O. (1873–1956), Chief of Air Staff, 1918–29, Chief Commissioner of Police, 1931–35, often known as the father of the Air Force and largely responsible for the establishment of the R A F College at Cranwell and the Hendon Police College

Trent, 1st Baron, of Nottingham (Jesse Boot) (1850–1931), founder of Boots Cash Chemists, Ltd, a great benefactor of Nottingham, especially of the University of Nottingham.

Trevelyan, George Macaulay, O M, C B E (1876–1962) English historian, son of Sir George Otto Trevelyan and great nephew of Thomas Babbington Macaulay. Regius Professor of Modern History at Cambridge 1927-40, Master of Trinity College, 1940. Chancellor of Durham University, 1949 His chief works are *History of England*, a trilogy of books on *Garibaldi*, *England under the Stuarts*, *England under Queen Anne*, *Grey of Fallodon*, *English Social History*; *An Autobiography and other Essays*

Trevelyan, Rt. Hon. Sir George Otto, 1st Bt., O M (1838–1928), Liberal statesman and historian. Became Chief Secretary for Ireland in 1882, and was later Secretary of State for Scotland. Wrote a biography of his uncle, Lord Macaulay, which was highly praised Father of Professor G M Trevelyan.

Trevithick, Richard (1771–1833), a Cornish mine-manager's son, who invented the road-locomotive, putting upon the highway on Christmas Eve, 1801, the first steam-propelled vehicle for passengers

Trollope, Anthony (1815–81), author of many novels His Barchester series depicts a number of scenes of higher clerical life with great fidelity and success.

Trotsky, Leon, name assumed by Lev Davidovich Bronstein (1879–1940), one of the leaders of the Bolshevist revolution. War Minister of the Bolshevist Government and its leading representative at the Brest-Litovsk conference of 1917-18 He differed from the Communist Party on policy and was dismissed from office in 1925. In 1929 took up exile in Mexico where he was assassinated.

Truman, Harry S. (b 1884), President of the United States, 1945–53. Inherited the Presidency on the death of Roosevelt in 1945 and won the Pres election in 1948. He took the historic decision to enter Korea in 1950, dismissed Gen MacArthur in 1951, and will perhaps best be remembered for his "Point Four" programme of raising levels of living in backward, and under-developed countries.

Tulsi Das (1532–1623), mediæval poet of India whose great masterpiece *Ram-Charit-Mānas* (popularly known as the *Rāmayana* and based on the Sanskrit epic of Vālmiki) is venerated by all Hindus just as the Bible is in the West.

Turenne, Henri de la Tour d'Auvergne, Vicomte de (1611–75), a famous French commander and Marshal of France, who was highly successful in the Thirty Years' War.

Turgenev, Ivan Serveyvich (1818–83), was a friend of Gogol and Tolstoy, and a famous Russian novelist and short-story writer. His works were frequently satirical and directed against the oppression of the peasants by the nobles. Was the inventor of the term "nihilist" to describe the Russian anarchist movement.

Turner, Joseph Mallord William, R.A. (1775–1851), was the son of a London barber, but while quite a child showed the possession of artistic genius In 1789, after some miscellaneous schooling, he entered the Royal Academy classes, and soon began to make headway. Of his larger pictures may be mentioned *The Sun Rising through Vapour*, *Crossing the Brook*, *Dido Building Carthage*, *The Fighting Téméraire*, and *Calais Pier*. Ruskin, in his *Modern Painters*, wrote with great eloquence and critical insight regarding Turner's work, and brought about a fuller appreciation of his genius. Turner never married, and took little interest in anything outside his art. He left the oil paintings and drawings he had preserved to the National Gallery.

Tussaud, Madame Marie (1760–1850), a Swiss who while practising the art of modelling wax in Paris at the time of the French Revolution, made her escape to England and set up a small exhibition of wax figures in the Strand, later carried on by her son, grandson and great-grandson at Baker Street and in 1884 transferred to Marylebone Road.

Tut-ankh-amen (*circa* 1350 B.C.), an Egyptian Pharaoh of the 18th dynasty, whose tomb was discovered by Howard Carter in 1922, with the mummy and gold sarcophagus intact. The magnificence of the objects found aroused world-wide interest.

Twain Mark. (*See* **Clemens, Samuel L.**)

Tweedsmuir, John Buchan, 1st Baron, C.H. (1875–1940), Gov-Gen. of Canada 1935–40, journalist, politician, and author, wrote numerous biographies, historical novels, and adventure stories, including *Montrose*, *The Path of the King*, *Greenmantle*, and *Sick-Heart River*, and an autobiography *Memory Hold the Door*. Under the pen name "O. Douglas" his sister, Anna (d 1948), published some charming tales of domestic life.

Tyler, Wat (d. 1381), the leader of the peasants' revolt of Richard II 's time against the iniquitous poll-tax. Over 100,000 peasants followed Tyler into London in June 1381, and the king met them in Smithfield and made promises of redress that were never fulfilled. It was at this meeting that Sir William Walworth, Lord Mayor of London, stabbed Tyler with a dagger, and afterwards handed him over to his followers to kill outright.

Tyndale, William (c. 1492–1536), was educated at Oxford, and conceived a strong desire to be the medium of presenting the Bible to his countrymen in their own language. He completed the translation of the New Testament at Wittenburg, where he was associated with Luther. This version was first published at Antwerp, and then found its way to England, where it was publicly burnt at St Paul's Cross Tyndale afterwards was associated with Miles Coverdale in a translation of the Old Testament, but only completed the Pentateuch and the book of Jonah. Antwerp was Tyndale's retreat during this later period, and in 1535 he was arrested for heresy and put to death by strangling and burning.

Tyndall, Prof. John, F.R S (1820–93), was an eminent scientist. His books on light, sound, and heat are well-known text-books.

U

Ulanova, Galina (b. 1910), Russian ballet dancer, made her debut in 1928 and is the world's greatest living exponent of the art. She danced in Florence in 1951 and in London in 1956.

Undset, Sigrid (1882–1949), Norwegian novelist, daughter of a distinguished Norwegian antiquary, from whom she derived her knowledge of life in ancient and mediaeval Norway. Her first success came with *Jenny* (1911), and the great works based on mediaeval history, *Kristin Lavransdatter* (1920–22) and *Olav Audunsson* (1925–27), won for her the 1928 Nobel Prize for Literature

Unwin, Sir Raymond (1863–1940), English architect and expert on Town Planning, who became known as the architect of the first garden city at Letchworth, and of the Hampstead Garden Suburb.

Ursula, St., is said to have been an English princess, who with 11,000 virgins set out on a pilgrimage, but compelled by a fierce storm to take refuge in Cologne, was there put to death with her following by an army of Huns.

Usher or Ussher, James (1581–1656), Irish prelate and scholar, one of the most distinguished

theologians of his day. He worked out a system of dates setting the creation at 4004 B.C.

Valentine, St., was a Christian martyr of the reign of the Emperor Claudius II (d. 270 A.D.). His festival was commemorated on February 14 before Gregory the Great's time. The custom of sending valentines had its origin in a heathen practice associated with the worship of Juno about this date in the calendar, and had no connection with the saint

Vanbrugh, Sir John (1664–1726), was a prominent architect as well as a successful dramatist

Vancouver, George (1758–98), a British navigator who served under Captain Cook and later explored the Gulf of Georgia and the Straits of San Juan de Fuca, as also the shores of Vancouver Island

Vanderbilt, Cornelius (1794–1877), a noted American merchant and railway speculator who accumulated a fortune of twenty millions sterling. His son William Henry Vanderbilt (1821–85) inherited and added to it.

Van Dyck (or Vandyke), Sir Anthony (1599–1641), was born at Antwerp, and after studying under Rubens went to Italy and there made a name as a portrait painter. In 1629 he came to England on the invitation of Charles I, but remained only a short time, in 1631 Charles prevailed upon him to return, made him a knight, granted him an annuity, and he became the Society painter of the day.

Vane, Sir Henry (1613–62), was a prominent statesman and diplomatist At the Restoration he was arrested as an enemy of the State and ultimately beheaded on Tower Hill

Van Gogh, Vincent (1853–1890), Dutch painter of some of the most colourful pictures ever created. With passionate intensity of feeling he painted without pause whatever he found around him—landscapes, still-lifes, portraits; his was a truly personal art. His life was one of pain, sorrow and often despair and in the end he committed suicide.

Van Loon, Hendrik Willem (1882–1944), Dutch-American historian, born in Rotterdam, who became famous in 1922 with the publication of *The Story of Mankind*, a picture history-book originally intended for children.

Vauban, Marshal Sebastien le Prestre de (1633–1707), a renowned French military engineer who introduced great improvements in methods of fortification, conducted fifty-three sieges, and took part in 140 battles

Vaughan Williams, Ralph, O.M., M A., D. Mus. (1872–1958), English composer. After Charterhouse and Cambridge he studied music in Berlin under Max Bruch and, later in Paris, under Ravel. He wrote nine symphonies besides a number of choral and orchestral works including *Sancta Civitas* and *Benedicite, Magnificat, Four Tudor Portraits, Dona Nobis Pacem*, operas including *Hugh the Drover, Riders to the Sea*, ballets, chamber music and songs. He showed great interest in folk tunes.

Velasquez, Diego (1465–1523), a Spanish soldier and companion of Columbus, sent to conquer Cuba. Velasquez founded Santiago and Havana.

Velazquez, Diego Rodriguez de Silvay (1599–1660), a famous Spanish painter, whose pictures rank among the finest in Spanish art

Venizelos, Eleutherios (1864–1936), the Greek patriot and statesman, suffered many vicissitudes of fortune during his career. A Cretan by birth, he became Prime Minister of Greece for the first time in 1910, and again on several subsequent occasions, but died in exile. Best known probably for his activity during the Balkan wars, his finally successful attempts to bring his country into the first world war on the side of the Entente Powers, and his ambitions in Asia Minor. At the post-war conferences in 1919 he exercised more influence than anyone else outside the "Big Four."

Verdi, Giuseppe (1813–1901), Italian composer, foremost figure in 19th-century opera. Early works include *Nabucco, Ernani, I Due Foscari*, and *Macbeth*. A middle period is represented by *Rigoletto, Il Trovatore, La Traviata, Un Ballo in Maschera*, and *Don Carlo*. To the last and greatest period of his life belong *Aida, Otello*, and his last opera *Falstaff*, produced when he was 80.

Verlaine, Paul (1844–1896), French poet, also well known for his memoirs and confessions; died in great poverty and degradation in Paris.

Vermeer, Jan (1632–75), Dutch painter and the greatest of all the "Little Masters" Jan Vermeer of Delft, as he was frequently referred to, was born in Delft, and obtained considerable recognition in his lifetime, but strangely his existence was entirely overlooked after his death, and until 1860 his paintings were attributed to other Dutch painters. *Lady at the Virginals* is in the National Gallery

Verne, Jules (1828–1905), was one of the most popular authors of wonder-stories in Europe The best-known of his numerous works are *Five Weeks in a Balloon, Twenty Thousand Leagues Under the Sea, Round the World in Eighty Days*.

Vernier, Pierre (1580–1637), inventor of the small sliding scale which enables readings on a graduated scale to be taken to a fraction of a division.

Veronese, Paul, or Paolo Cagliari (1528–88), a celebrated Italian painter of religious subjects. His *Marriage Feast at Cana in Galilee, The Feast in the House of Simon*, and *The Presentation of the Family of Darius to Alexander*, are paintings of world-wide celebrity, while his *Adoration of the Magi*, in our National Gallery is a grand work

Veronica, St., a legendary woman of Jerusalem, who was said to have handed to Christ her kerchief on His way to Calvary The old belief was that the Redeemer wiped His brow therewith, leaving on the handkerchief a miraculous impression of His face, the so-called "Veronicon." The Saint is commemorated on February 4th.

Verwoerd, Dr. Hendrik Frensch (b. 1901), succeeded J G. Strydom as Prime Minister of South Africa in 1958 Prof of Psychology at Stellenbosch Univ., 1928–50 An unsuccessful attempt to assassinate him was made on Apr 9, 1960.

Vespasian (Titus Flavius Vespasinus) (9–79 A.D.) was Roman Emperor during the last nine years of his life. At one time he commanded the Roman army of occupation in Britain

Vespucci, Amerigo (1451–1512), Florentine merchant and navigator, who settled in Spain as commercial agent of the house of Medici He made several voyages across the Atlantic and, according to his own accounts, which are disputed by many authorities, reached the American continent on June 16, 1497. A German geographer paid him the tribute of giving the name America to what is now known as South America in a map he published in 1507

Victor Emmanuel II. (1820–78) was King of Sardinia from 1849 to 1861, became King of Italy, according the the Proclamation of the Sardinian Senate, but it was not until 1870, when the unification of Italy was fully secured, that the title came to have its true significance.

Victoria (1819–1901), Queen of Great Britain and Ireland and Empress of India, was daughter of the Duke of Kent, and came to the throne in 1837 on the death of her uncle, William IV In 1840 she married Prince Albert of Saxe-Coburg-Gotha, who died in 1861. Lord Melbourne was Prime Minister at the date of the Queen's accession, and for a number of years the country lived through troublesome times, the Corn Law and Chartist agitations being at times very threatening, but a more settled condition of things supervened, and for the remainder of the long and illustrious Victorian reign there was no serious home unrest. The Jubilee of Queen Victoria's accession was celebrated in 1887, and the Diamond Jubilee 10 years later.

Villeneuvre, Pierre Charles Baptiste Silvestre (1763–1806), the French naval commander who was opposed to Nelson at Trafalgar and captured along with his ship, the *Bucentaure*.

Villon, François (1431–c. 1485), French poet who lived at a turbulent time in French history at the close of the Hundred Years War. His extant works consist of *Le Lais* (or *Petit Testament*) and *Grand Testament*, masterpieces of French mediæval verse

Virgil (Publius Vergilius Maro) (70–19 B C.), the great Roman epic poet, was born near Mantua, and cultivated a farm in the adjacent village of Andes. He proceeded to Rome in his thirtieth

year to obtain redress for the occupation of his lands by the military. Became known to Octavian and Mæcenas, and, having had his demand satisfied, began the writing of his *Eclogues*. *The Georgics* followed: his most famous work, the *Æneid*, comprised twelve books dealing with the story of the wanderings of Æneas after the destruction of Troy.

Vitus, St., Roman Catholic saint and martyr, who lived in the 4th century. It used to be the custom to dance before his shrine on this festival day, June 15th, in the belief that good health was thereby ensured for the next twelvemonth. The nervous ailment, St. Vitus' dance, derives its name from this practice

Vivaldi, Antonio (c. 1675–1743), Venetian composer For many years violin master at the Ospedal della Pieta there. His output of orchestral works was prolific, and their re-assessment in recent years has immensely added to his reputation, long disparaged by English writers Bach indeed arranged some of his violin pieces for the harpsichord.

Volta, Alessandro (1745–1827), Italian physicist, professor at Como and Pavia Working on the results of Galvani, he found that the essential thing in producing an electric current was contact of dissimilar metals He invented the voltaic pile, the first instrument for producing an electric current, and thereby laid the foundation of electrochemistry

Voltaire, François-Marie Arouet de (1694–1778), one of the greatest of French philosophers and writers. His first essays offended the authorities, and he lived in London for a couple of years (1726–28), and there wrote some of his dramas. Returning to France he published his *Philosophical Letters*, which aroused the enmity of the priesthood At this juncture, the Marquise du Châtelet offered him the asylum of her castle of Cirey, and for the next fifteen years he made this his home, writing there his *Discourses on Man, Essay on the Morals and Spirit of Nations, Age of Louis XIV*, &c From 1750–53 he lived in Berlin, on the invitation of Frederick the Great

Vondel, Joost van den (1587–1679), the greatest of the Dutch poets Most of his dramas are on biblical subjects, and the two most famous are *Jephtha* and *Lucifer*

Voroshilov, Marshal of the Soviet Union Klimentiy Efremovich (b 1881), President of the Supreme Soviet of the U.S S R , 1953–60, commander of the Leningrad defences in 1941.

Vyshinsky, Andrei Yanuarievich (1883–1954), Russian jurist and diplomat; conducted the prosecution of the Moscow treason trials, 1936–38, represented Russian interests at U N.

W

Wade, George (1668–1748), military engineer who after the Jacobite rebellion of 1715 commanded the royal forces in Scotland and constructed the great military roads through the Highlands, some of which have continued to be the main lines of communication Promoted to Field-Marshal in 1743 and in 1744 George II made him Commander-in-Chief in England In the last Jacobite rising of 1745 his army was the first to be evaded by the Young Pretender, Charles Edward, on his famous march south.

Wagner, Richard (1813–83), German composer, born at Leipzig He achieved a new type of musical expression in his operas by the complete union of music and drama, and his influence on later composers was immense. He made use of the *leitmotif* principle and was his own librettist His originality and modernism aroused a good deal of opposition, and he was exiled for some years. But he was supported by many loyal friends, including Liszt, the young King Ludwig of Bavaria, and the philosopher Nietzsche. He began the music of the *Ring des Nibelungen* in 1853, finishing it a quarter of a century later. It was not until 1876 that the whole of this great drama (Rheingold, Valkyrie, Siegfried, Götterdämmerung) was performed at Bayreuth under the conductor Hans Richter. Other operas include *The Flying Dutchman, Rienzi, Tannhäuser, Lohengrin, Tristan und Isolde, Die Meistersinger von Nürnberg, Parsifal*, a religious drama. He married Liszt's daughter Cosima, formerly wife of his friend Hans von Bülow.

Waley, Arthur, C.H., C.B.E., M.A. (b. 1889), orientalist, well known for his translations of Chinese and Japanese poetry and prose, being the first to bring the literature of those countries to the western world.

Walker, George (1618–90), the hero of the siege of Londonderry, in 1688, who kept the besiegers at bay for 105 days.

Wallace, Alfred Russel, O.M., F.R.S., LL.D. (1823–1913), celebrated naturalist, a native of Usk, attracted much notice as far back as 1853 by his book *Travels on the Amazon*, detailing experiences in that region. In 1858, while down with illness in the Moluccas, the idea of the evolution theory occurred to him, and curious to say, he drafted his first notes upon it and sent them to Darwin in England while the latter was on the eve of publishing his own exposition of the theory, the result being the reading of a joint paper on the subject to the Linnean Society. The coincidence was fully acknowledged by Darwin There are differences, however, between the points of view of the two thinkers.

Wallace, Edgar (1875–1932), English novelist and playwright, famous for his detective thrillers

Wallace, Sir Richard, Bt. (1818–90), son of the Marquis of Hertford, and inheritor from him of a famous collection of pictures and other works of art to which he himself added largely. This was bequeathed to the nation by his widow along with Hertford House and now forms one of the most important exhibitions in London.

Wallace, Sir William (*circa* 1270–1305), the great Scottish patriot and chieftain who led the Scottish armies against Edward I., and for a time the English were kept completely in check Later, Edward defeated him at Falkirk, and finally in 1304 he was captured, taken to London, condemned for treason, executed at Smithfield.

Wallenstein, Albrecht von (1583–1634), German soldier and statesman during the Thirty Years' War. An able administrator of his own estates, he sought the unity of Germany, but was distrusted and eventually assassinated.

Waller, Edmund (1606–87), was one of the most graceful of English poets, who tuned his lyre to suit both the Cromwellians when they were a power, and Charles II, when his turn came.

Walpole Horace, 4th Earl of Orford (1717–97), younger son of Sir Robert Walpole. He was a member of Parliament from 1741 to 1768, when he retired to his favourite house at Strawberry Hill (" a little Gothic castle ") and devoted himself to the writing of books and the accumulation of works of art His letters give a graphic picture of Georgian England

Walpole, Sir Hugh Seymour C B E., (1884—1941), a well-known British novelist, whose novels include *Fortitude, The Dark Forest, Jeremy*, and *Mr Traill*

Walpole, Sir Robert, K G (1st Earl of Orford) (1676–1745), great 18th-century Whig statesman. He sat in the House of Commons for over forty years, and was Prime Minister for the record period of twenty-one years. Although he enriched himself at the public expense, he was a great financial statesman, and his management of the national debt, encouragement of trade and industry, and his mercantilist colonial policy made England materially very prosperous.

Walter, Bruno (1876–1962), a noted conductor of German birth and American citizenship, associated especially with the opera in many different cities.

Walter, John (1776–1847), son of the founder of *The Times* and known as the second John Walter Was the leading spirit of *The Times* from 1803 to 1847, and it was his efforts that made the journal the greatest newspaper in the world.

Walton, Izaak (1593–1683), one of the most lovable of English writers, the famous author of *The Compleat Angler, or the Contemplative Man's Recreation*. Also published lives of Donne, Hooker and George Herbert.

Walton, Sir William Turner (b. 1902), English composer, whose works include concertos for string instruments, a symphony, and coronation march, *Crown Imperial*, and an oratorio, *Belshazzar's Feast*.

Warbeck, Perkin (1474–99), a Pretender to the English Crown. The son of a Tournai Jew, he claimed to be Richard, Duke of York, supposed to have been murdered in the Tower, and therefore entitled to the throne of England in preference to its then occupant, Henry VII. The Duchess of Burgundy and Charles VIII. of France and James IV. of Scotland gave him their countenance. Warbeck was enabled in 1497 to appear in England at the head of a force of 7,000 men, but was easily defeated, tried for treason and hanged at Tyburn.

Warwick, Richard Neville, Earl of (*circa* 1428–71). "The King Maker," was the leader of the York party in the Wars of the Roses. At the battle of Northampton he made Henry VI. captive, and afterwards proclaimed Edward, Earl of March, king under the title of Edward IV. Then, when Edward showed a disposition to resent Warwick's protection, the latter drove Edward from the country and once more placed Henry VI. on the throne. He lost his life at the battle of Barnet.

Washington, Booker Taliaferro (1856–1915), a famous negro educationist who was Principal of Tuskegee Institute, Alabama, the first and greatest Institute for negro education, from 1881 until his death. He was a tireless worker for a better understanding between negroes and whites. Wrote several books, including his autobiography, *Up from Slavery*.

Washington, George (1732–99), was of English descent, and was living on his American estate at Mount Vernon when the dispute between the British home government and the colonists broke out. He became one of the leaders of the local opposition, and later was elected to the first Congress at Philadelphia. The following year, 1775, saw him Commander-in-Chief of the American army, and from that time to the end of the struggle in 1783 he was trusted and adored by the people, and on the founding of the Republic became its first President in 1789. He served a second term of office from 1793 onwards, and refused election for a third time

Watson, John Broadus (b 1878), American psychologist of international fame who formulated the theory known as Behavourism, of which he became the leading exponent It substantiates the work of the late Professor Pavlov

Watson-Watt, Sir Robert, F R S (b 1892), British physicist and engineer, chief of team of scientists engaged in radio location research which resulted in every aircraft and ship being equipped with radar aids enabling them to detect, locate, and shadow enemy craft with great accuracy during the Second World War.

Watt, James, F.R S., F.R S E (1736–1819). Born at Greenock, this genius was originally a mathematical instrument maker, and being brought into touch with mechanical problems, conceived the idea of the modern, that is, high-pressure steam-engine. Watt took out his first patent in 1769; the engine, however, was used only for mining operations until 1785, when it was applied to a cotton factory, Watt being greatly aided in his developments of the engine by the business ability of his partner, Matthew Boulton

Watteau, Jean Antoine (1684–1721), a French landscape painter of transcendent ability, and especially great in *genre* His shepherds and shepherdesses, rustic dance and fête scenes were wonderful for their harmonious brilliancy of coloration. His *chef-d'œuvre* is the *Embarkation for the Isle of Cytherus*, in the Louvre.

Watts, George Frederick, O.M , R A. (1817–1904), occupied a unique place in English art. His works are numerous, among them may be mentioned *Love and Death*, *Hope* and *The Angel of Death*. He bequeathed to the nation a large number of his finest pictures. His portraits of Swinburne, Carlyle, Cardinal Manning, Browning, and Tennyson are especially fine.

Watts, Isaac (1674–1748), a great English hymn-writer; author of *O God, our help in ages past*.

Watts-Dunton, Walter Theodore (1836–1914), a prominent critic and close friend of Swinburne. Published *The Coming of Love* in 1897, and *Aylwin* in 1898.

Waugh, Evelyn Arthur St. John (b. 1903), English satirical writer, author of *Vile Bodies*, *The Loved One*, *Brideshead Revisited*, *Life of Edmund Campion*, *The Ordeal of Gilbert Pinfold*. His brother, **Alec Waugh** (b. 1898), is also a successful writer, the author of *The Loom of Youth*, *So Lovers Dream*, and *His Second War*.

Wavell, Field Marshal Earl, P.C., G.C.B., G C S.I , G C.I.E., C M G , M C. (1883–1950), Viceroy of India 1943–47, Com.-in-Chief India 1941–43; Com -in-Chief British Forces in Middle East 1939–41, previously Southern Command 1938–39 and of troops in Palestine 1937–39. Described as one of the cleverest generals in the British Army, his strategy against the Italians in the winter campaign of 1940–41 was brilliantly successful.

Webb, Sir Aston, G.C.V O , C B., R.A. (1849–1930), President of the Royal Academy, 1919–24, one of our foremost architects, and the designer of the general scheme of the Victoria Memorial in front of Buckingham Palace, the new Birmingham University, the Britannia Naval College at Dartmouth and other fine structures.

Webb, Matthew (1848–83), in 1875 swam the English Channel in twenty-two hours, and was drowned eight years later in an attempt to swim through the Niagara rapids.

Webb, Rt. Hon. Sidney James, O M. (1859–1947), eminent Socialist, one of the founders of the Fabian Society in 1884. Sec of State for the Colonies 1929–31, and for the Dominions, 1929–30. Pres of Board of Trade in first Labour Government, 1924. His wife Beatrice, equally with himself, was a great investigator and writer on political and economic affairs Among their books were *History of Trade Unionism*, *English Local Government* and *Soviet Communism* He founded (1913) and edited (till 1922) the *New Statesman*. Raised to the Peerage, 1929, as **Lord Passfield**.

Weber, Carl Maria Friedrich Ernst von (1786–1826), German composer, who is usually looked upon as the founder of the German national opera and of the German romantic movement, which found its complete musical expression in Wagner His fame rests principally on his three great operas *Der Freischutz*, *Euryanthe*, and *Oberon*, the last being written for Covent Garden He was an able pianist, conductor, and musical director as well as composer He died in London after the performance of *Oberon*, and his body was taken back to Dresden in 1844

Webster, Daniel (1782–1852), an American, who, as statesman, lawyer, and orator, exerted enormous influence on American constitutional ideas and practice Served twice as Secretary of State and in 1842 negotiated the Ashburton Treaty which settled the Maine–Canada boundary.

Webster, Noah (1758–1843), the American lexicographer and grammarian Author of the *Dictionary of the English Language*, and works on literary and political themes.

Wedgwood, Josiah, F R S (1730–95), was the most famous of English potters He was born at Burslem, served an apprenticeship that carried him through all the branches of the trade, and in 1759 was able to set up in business for himself with money he had saved. He persevered through failure after failure, and in a few years produced such an improved form of ware that it came into great demand He engaged Flaxman to make classical designs for him, and his pottery became the fashion, and led to a great extension of the Staffordshire earthenware industry.

Weill, Kurt (1900–50), German composer of satirical, surrealist operas, including *Die Dreigroschenoper* (librettist Bert Brecht), and musical comedies, including *Lady in the Dark*, and *One Touch of Venus* He left Germany in 1933 for France and went to the United States in 1935.

Weingartner, Paul Felix von (1863–1942), Austrian conductor and composer, studied at Leipzig and with Liszt. Established himself as a brilliant conductor, held several appointments in Germany, succeeded Mahler at the Vienna State Opera, and became head of the Conservatory of Music at Basle. His compositions include six symphonies, several operas, and some chamber music.

Weismann, August (1834–1914), a distinguished German biologist who was Prof. of Zoology at

Freiburg, 1866–1912. He is remembered for his theory that heredity is a question of the continuity of the germ-plasm and that acquired characteristics cannot be transmitted to descendants.

Weizmann, Chaim, D Sc, LL D, Ph.D (1874–1952), Zionist leader, became provisional President of Israel in May 1948, and was elected first President in 1949. Distinguished microbiologist and organic chemist

Wellesley, Richard Colley Wellesley, Marquess, K.G., P.C., K.P. (1760–1842) was Pitt's famous governor general of India, the son of the Earl of Mornington, the first professor of music at Trinity College, Dublin, and elder brother of the Duke of Wellington.

Wellington, Arthur Wellesley, 1st Duke of, K.G., P C, G C B (1769–1852), was the most famous British general of the 19th century He distinguished himself in India and conducted successfully the Peninsular War. In 1814 he was British Ambassador at Paris Then came Napoleon's escape from Elba, the short and sharp campaign which terminated at Waterloo, and the final overthrow of Napoleon Wellington became the most prominent man in the Empire From 1828 to 1830 he was Prime Minister From 1842 to his death he was Commander-in-Chief His funeral at St. Paul's was one of the great pageants of last century.

Wells, Herbert George (1866–1946), English novelist, sociologist and reformer, one of the most creative and influential writers of his time, a man with a passionate faith in progress through science. His long series of books included romances of the Jules Verne variety (*The Time Machine, The Island of Dr Moreau, The Invisible Man*), sociological autobiography (*Love and Mr. Lewisham, Kipps, Tono-Bungay, The History of Mr. Polly, Mr Britling Sees it Through*), and popular education (*Outline of History, The Science of Life, The Work, Wealth, and Happiness of Mankind, The Shape of Things to Come, The Fate of Homo Sapiens*). His great attempt at educating the common man proved so successful that his imitators have been legion He was a founder member of the Fabian Society.

Wesley, Charles (1708–88), brother of John Wesley, and the poet of Methodism Wrote a large number of hymns of enduring merit

Wesley, John (1703–91), the founder of the great religious communion of the people called "Methodists," and the son of a clergyman of the Anglican church Taking orders himself, in 1735, he went to Georgia as a missioner and allied himself with the Moravians, but later he abandoned all ecclesiastical traditions, and established, on a wonderfully well-devised basis, the connexion called by his name His own open-air preaching was powerful in the extreme, his energy and depth of purpose inspiring, and his organising ability exceptional. He accomplished a great work of religious revivification, taking the world as his parish, and profound as was his conviction of his high calling as an Evangelist, John Wesley "builded better than he knew" in rearing the denominational edifice which is the monument of his faith and vigour *See also* **Methodism, Section J.**

West, Rebecca, D.B.E. (Mrs. Cicily I. Andrews) (b 1892) novelist, critic and journalist Among her books are *Black Lamb and Grey Falcon* (a travel book and commentary on Yugoslavia, 1942), and *The Fountain Overflows*, 1957.

Westermarck, Edward Alexander, Ph D. (1862–1939), a distinguished Finnish scientist who was Professor of Sociology at the University of London, 1907–30. Born at Helsingfors, he made an international reputation with the monumental *History of Human Marriage*, written in English and published in 1891. His *Origin and Development of the Moral Ideas*, 1906–8, was followed by many other works, including *A Short History of Marriage*, 1926; *Ethical Relativity*, 1932, and *The Oedipus Complex*.

Westinghouse, George (1846–1914), American engineer who built the dynamos for Niagara Falls, and in 1865 invented the compressed air brake known by his name and developed a compressed air system of railway signalling.

Westmacott, Sir Richard, R.A. (1775–1856), a great English sculptor who studied under Canova at Rome, and succeeded Flaxman as Professor at the Royal Academy. He executed many fine monuments in Westminster Abbey, at St. Paul's Cathedral, and elsewhere, including the statue of Achilles in Hyde Park and the pediment of the British Museum.

Wharton, Edith (Jones) (1862–1937), American novelist whose *House of Mirth* (1905) brought her fame as a social satirist Her work was greatly influenced by her friend Henry James, and most of her fifty-four volumes were written after she was thirty-five.

Whately, Archbishop Richard (1787–1863), was for over thirty years Archbishop of Dublin, and achieved a high reputation as a writer on theology and philosophy His treatises on *Rhetoric* and *Logic* are among the most notable books of their class.

Wheatstone, Sir Charles, F.R.S. (1802–75), was an eminent English electrician and scientist, whose experiments in association with Mr. W. F. Cooke resulted in the first application in this country of the principle of the electric telegraph. The stereoscope was also one of his inventions. He was Professor of Natural Philosophy to King's College, London, for many years

Wheeler, Sir Charles, K C.V O., C B.E., P R.A., F.R B S (b. 1892), British sculptor; P.R.A., 1956

Whistler, James Abbott McNeill (1834–1903), was an original artist, writer, and wit, who first came to Europe from America in 1857, and made a name as an etcher both in Paris and in London. His studies of Thames scenery are especially fine. When he began to exhibit pictures in oils he greatly puzzled the critics, some of whom discovered in his "nocturnes" and other studies an impressionist of surpassing genius, while others, including Mr. Ruskin, who described one of the "nocturnes" at the Grosvenor Gallery as a "pot of paint flung in the public face," looked upon them as mere audacious eccentricities. The finest of his oil paintings are the portrait of his mother, and that of Carlyle. He brought an action against Ruskin for the criticism referred to, but only obtained a verdict of one farthing damages without costs

White, Field-Marshal Sir George Stuart, V.C., G C B, O M, G C M G, G C I E, G C V.O. (1835–1912), the heroic defender of Ladysmith in the South African War and a soldier who achieved renown at many points of a long military career

Whitefield, George (1714–70), was for a time associated with John Wesley at Oxford in the propagation of Methodism and attracted great attention by his gifts as a preacher. He was Wesley's most powerful champion, but in 1741, differing from Wesley on a point of doctrine he left the Methodists, and thenceforward simply preached as an evangelist, allying himself with no sect, but expounding Calvinistic doctrines with fervour and eloquence.

Whitgift, John (1530–1604), a gifted Anglican prelate Persecuted the Puritans, and was one of the authors of the famous *Lambeth Articles* Was Archbishop of Canterbury 1583–1604.

Whitman, Walt (1819–92) was an original figure in the world of American authorship, and produced many works of striking poetic merit He served in the Civil War, and his vigorous humanity, as expressed in his writings, made him a distinguished personality. His works include *Leaves of Grass*, *Drum Taps*, and *Democratic Views*.

Whittier, John Greenleaf (1807–92), America's Quaker poet, was the son of a New England farmer, and for a time followed the trade of a shoemaker. After some experience in journalism, he published his first book of poems, *Legends of New England* (1831). His best-known volumes are: *Lays of My Home* (1843), *Voices of Freedom* (1846), *Songs of Labour* (1850), and *National Lyrics* (1865).

Whittington, Richard (*circa* 1358–1423). The son of a Gloucestershire knight who was outlawed. Richard went up to be apprenticed in London and there found fortune and fame eventually as a merchant. Four times Mayor of London and representative of the City in Parliament he was a great man in his time, engaging in many profitable and honourable enterprises. Richard was well styled "the model merchant of the Middle Ages," and he did marry his

master's daughter, and no doubt drew some sort of inspiration from the bells of Bow

Whittle, Air Commodore Sir Frank, K.B.E., C.B. (b. 1907), pioneer in the field of jet propulsion. The first flights of Gloster jet-propelled aeroplanes with Whittle engine took place in May 1941.

Whymper, Edward, F.R.S E. (1840–1911), a wood-engraver and artist; also one of the best-known Alpine climbers, and the first to reach the summit of the Matterhorn. Author of books on mountaineering in various countries

Wiggin, Kate Douglas (Mrs. George C. Riggs) (1856–1923), an American novelist of quaint charm and humour. Author of *Rebecca of Sunnybrook Farm.*

Wilberforce, William (1759–1833), was the son of a Hull merchant. He was educated at Cambridge, and entered Parliament in 1780 In 1789 made the first of his many proposals in the House of Commons for the abolition of the slave trade, but it was not until 1807 that the Act embodying these proposals was carried.

Wilcox, Mrs. Ella Wheeler, a popular American poetess (1855–1919). Writer of sentimental verse

Wilde, Oscar Fingall O'Flahertie Wills (1854–1900), Irish author and dramatist. The son of Sir William Wilde, a well-known Dublin surgeon, was the leader of the cult of æstheticism, of art for art's sake. His works included poems, fairy-tales and short stories He is best known, however, for his brilliantly witty comedies, *Lady Windermere's Fan, A Woman of No Importance, The Ideal Husband* and *The Importance of Being Earnest.*

Wilder, Thornton Niven (b. 1897), American author and playwright Among his books are *The Bridge of San Luis Rey* and the *Ides of March.*

Wilkes, John (1727–97), was a forcible, daring, and original Whig politician, who championed the cause of the people with great vigour, and was for a time exceedingly popular For a violent attack on the Government in his paper *The North Briton,* he was committed to the Tower, but obtained release on the ground that he was a member of Parliament. He was later expelled from the House and fled to France, returning in 1768, and elected M P for Middlesex. A fresh prosecution, however, and a fresh expulsion took place, and three times he was expelled and as often re-elected. A great agitation ensued, and so high was he in favour among the people, that he was made alderman, then sheriff, then Lord Mayor of London In the end his opponents gave way, the orders against him were withdrawn, and from 1779 he was Chamberlain of the City of London

Wilkie, Sir David, R A. (1785–1841), was an eminent painter of popular subjects, mostly of rural life.

Willcocks, Sir William, K C M G (1852–1932), a British engineer, born in India, who in 1898 planned the great Aswan Dam, which he completed in 1902 In 1911 he undertook for Turkey a vast scheme for irrigating some 31 million acres in Mesopotamia.

Willett, William (1856–1915), an English builder, noted for his long and tireless advocacy of the Daylight Saving scheme, which, however, he did not live to see put into effect. It was adopted as a war-time measure in the year following his death. (*See* Summer Time, Gen Inf)

William I. (1027–87), the "Conqueror," Duke of Normandy, claimed the English throne as legally appointed successor to Edward the Confessor and, at the Battle of Hastings in 1066, defeated Harold II who was killed. The new king crushed Saxon resistance in the North and West, transferred most of the land to his Norman followers, and drew England into closer relations with the Continent. Maintaining many old institutions such as the shire-court and the fyrd (a non-feudal army), William governed firmly, and was supported by the Church, especially by Lanfranc, Abp. of Canterbury. In 1085 he ordered the Domesday Survey (*q.v.*).

William I. of Prussia (1797–1888), the maker of modern Germany, succeeded to the throne of Prussia in 1861. It fell to him to have the control of his country during a period of mighty transition and development, with Bismarck as his chief minister. The war with Austria rendered him highly popular, and when in 1870 the war with France was entered upon the whole German people rallied round him, and after a series of brilliant achievements by his army he was proclaimed German Emperor on the 18th of January, 1871.

William II. (1056–1100), the Conqueror's son, surnamed "Rufus," King of England from 1087 to his death. Was in constant conflict with his barons, lived a life of wanton pleasure, was oppressive to his subjects, and was shot (by accident or design) while hunting in the New Forest.

William II., the Kaiser (1859–1941), King of Prussia and German Emperor 1888 until he abdicated Nov. 9, 1918, and fled to Holland, where he was subsequently interned in the castle of Doorn, living there in complete retirement until his death in June, 1941. Educated at Cassel and Bonn, afterwards entered the army and took a keen interest in military affairs. Succeeded his father, the Emperor Frederick, in 1888. His reign was marked by a strong militarism and an intense ambition to secure the dominance of Germany in the Councils of Europe —an ambition which contributed to the outbreak of the first great war in 1914.

William III. (1650–1702), King of England, Scotland, and Ireland (1689–1702), son of William II of Orange (1626–50) and Mary (1631–60), daughter of Charles I. He married Mary, eldest daughter of the Duke of York (later James II) while Stadtholder of Holland. As captain-general of the Dutch forces he was successful against the French, and in 1688, when James had abdicated and fled the country, William was invited to succeed him and he and Mary afterwards became joint King and Queen. Later he was at war with France, and suffered defeats, but ultimately effected an honourable peace by the Treaty of Ryswick in 1697.

William IV of England (1765–1837) was the third son of George III., and ascended the throne in 1830 in succession to his brother, George IV. He had seen some sea service, and was flatteringly styled the "Sailor King." He showed little of kingly capacity, he was genial and pleasure-loving, and placed no obstacles in the way of government, so was, after a sort, popular In the early part of his reign (1832) the first great Reform Bill was passed

William the Silent (1533–84), Prince of Orange, made many attempts to secure a peaceful settlement of Netherlands' disputes with Philip II, but became the leader of the ensuing Revolt and was assassinated. He established the independence and Protestant character of the Northern Netherlands, where literary, artistic, colonising, and commercial activity flourished in the following century.

Williams, Sir George (1821–1905), the founder of The Young Men's Christian Association

Williams, (George) Emlyn (b. 1905), Welsh actor-playwright, and producer, who has had great success in numerous plays and films, and latterly in his readings from Dickens and Dylan Thomas. Author of *Night Must Fall, The Corn is Green,* and *The Light of Heart.*

Wilson, Rt. Hon. (James) Harold, O B E , M P. (b. 1916), British statesman and economist; Leader of the Labour Party in succession to the late Hugh Gaitskell, 1963– ; Labour M P for Ormskirk, 1945–50, for Huyton, 1950– ; Pres. of the Board of Trade, 1947–51 (one of the youngest Cabinet ministers since Pitt).

Wilson, Richard, R A. (1714–82), a landscape and portrait painter. Was the pioneer of modern landscape painting

Wilson, (Thomas) Woodrow (1856–1924), President of the United States 1913–21 Was Governor of New Jersey, 1912–13. In 1916 secured from the Kaiser a promise to abandon the more inhuman forms of submarine warfare, and, on their resumption in 1917, broke off official relations with Germany and proclaimed a state of war. Entered into the conflict with the utmost vigour, bringing the full military and financial resources of the Republic into play against Germany. Was a great factor in the winning of victory and in the concluding of a just peace. Largely responsible for the setting up of the League of Nations, which was foreshadowed in his famous Fourteen Points.

Wingate, Major-Gen. Orde Charles, D S O (1903–44), was the renowned and daring leader of the Chindit forces engaged behind the Japanese lines in Burma during the second world war. Killed in an air crash.

Winifred, St., the 7th-century patron saint of virgins, a Welsh maiden, who, importuned by Prince Caradoc, treated him with scorn, and he had her beheaded.

Wiseman, Nicholas Patrick Stephen, Cardinal (1802–65), the first R.C. Archbishop of Westminster, created Cardinal. Much of his life was spent in the reorganisation and development of the Roman Catholic Church in Great Britain He was one of the three great R.C. prelates of the nineteenth century, the other two being Manning and Newman.

Wolf, Friedrich August (1759–1824), a great German scholar, regarded by some as the founder of scientific classical philology.

Wolf, Hugo (1860–1903), Austrian song-writer In his settings of over 300 German lyrics, including many of Mörike and Goethe, he achieved complete union of poetry and music.

Wolfe, General James (1727–59), commanded the British forces in Canada at the siege of Quebec, where he won a brilliant victory, which cost him his own life

Wolsey, Cardinal Thomas (c. 1473–1530), was the son of an Ipswich butcher Showing ability, he was sent to Oxford to be educated, later on entering the Church, where he gradually rose to a position of eminence, and was entrusted with several diplomatic missions He was especially favoured by the King, Henry VIII., and secured rapid preferment under that monarch, being in turn Bishop of Lincoln, and Archbishop of York. He was subsequently made Cardinal and became Henry's Chancellor For a number of years he was supreme, and by his diplomacy did much to strengthen the kingly power. But when Wolsey was unable, though willing enough, to obtain the papal sanction for Henry's divorce of Catherine, he fell into disfavour, and his decline was rapid indeed From being a great personage, with a princely entourage, he was humbled, persecuted, and harried, and died at Leicester Abbey a broken, dejected man.

Wood, Sir Henry Joseph, C H (1869–1944), was the most popular English musical conductor of his day. He introduced many works and composers previously unknown to the British public and greatly stimulated and encouraged interest in classical music His long association with the Promenade Concerts began in 1895 at the Queen's Hall, and after it was destroyed in an air raid in 1941 the concerts continued at the Albert Hall and are now named after him. He composed songs and cantatas, and his arrangement of sea shanties ends every series of Promenade Concerts

Woodcock, George (b. 1904), succeeded Sir Vincent Tewson as secretary of the T U C. in 1960 Won scholarships to Ruskin College, Oxford, and Oxford Univ and gained first-class honours in philosophy, politics, and economics Appointed research officer of T U C in 1936 and assistant general secretary in 1947

Woodville, Elizabeth (1437–91), wife of Sir John Grey. After her first husband's death she made a secret marriage with Edward IV , and became the mother of Edward V , and his brother Prince, both of whom were put to death in the Tower by order of Richard III She was also mother to Elizabeth, Queen of Henry VII

Woolf, Mrs. (Adeline) Virginia (1882–1941), English novelist and essayist, daughter of Sir Leslie Stephen and wife of Leonard Woolf, writer and publisher. Together they formed the Hogarth Press. Among her best known works are *To the Lighthouse*, *Mrs Dalloway*, *The Waves*, *The Years*, *A Room of One's Own*, *Orlando*.

Woolley, Richard van der Riet, Sc D , F R S. (b. 1906), succeeded Sir Harold Spencer Jones as Astronomer Royal at the Royal Greenwich Observatory in 1956; formerly Commonwealth Astronomer and Director of the Commonwealth Observatory at Canberra.

Wootton, Barbara Frances, Baroness, M.A., L.H.D., J.P. (b. 1897), Prof. of Social Studies, Univ. of London, 1948–52. Chair. Metropolitan Juvenile Courts. Her book *Social Science and Social Pathology* (1959) examines the state of our knowledge about social pathology, with particular emphasis on criminology and social work. Created a life peeress in 1958.

Wordsworth, William (1770–1850), the chief of the " Lake Poets," and one of the most inspired of all British bards, was a native of Cockermouth, and was educated at Hawkshead and St John's College, Cambridge. In association with Coleridge he issued a volume of *Lyrical Ballads* in 1798. The following year saw him settled at Grasmere, and there and at Rydal Mount he passed the rest of his days. In 1802 he married Mary Hutchinson, his cousin, and the two, with the poet's sister Dorothy, formed an ideally poetic household. Here he carried out his creed of " plain living and high thinking," and produced at intervals some of the purest and noblest poetry in the language As an interpreter of Nature in her many moods he stands unrivalled Succeeded to the Poet Laureateship on the death of Southey in 1843

Wren, Sir Christopher, F R S. (1632–1723), the most famous English architect of his time. He did not quite have all his own way with the tremendous thirty-five years' task he accepted in undertaking the reconstruction of St Paul's after the Fire, but he produced a masterpiece of which Britain may well be proud Chelsea and Greenwich Hospitals, and a number of London's finest churches were also his work

Wright, Sir Almroth (Edward), K.C.B., C.B., M D., F.R.S (1861–1947), discovered the system of anti-typhoid inoculation, the method of therapeutic inoculation for bacterial infections (vaccinotherapy), and methods of measuring the protective substances in human blood.

Wright, Frank Lloyd (1869–1959), American architect who, with others, brought into fashion the present-day horizontal strip and all-glass design His imaginative ideas, both as to structure and look, have influenced architecture all over the world Early buildings were the Larkin office building, Buffalo, N Y , and the Imperial Hotel, Tokio, which withstood the 1923 earthquake. His last building was the Guggenheim Museum in New York, based on a spiral.

Wright, Orville (1871–1948), American airman who, with his brother **Wilbur** (1867–1912), began gliding experiments on the sand dunes at Kitty Hawk, North Carolina. To the glider they built they added a petrol engine, and on 17th Dec , 1903, they made four flights, the longest being 852 ft These flights were the first in which a man had been carried from the ground on flight by a power-driven aeroplane.

Wyatt, James, R A (1746–1813), a celebrated architect in his day. He built Fonthill Abbey for Beckford and the Royal Military Academy at Woolwich. Pres of R.A 1805–6

Wyatt, Sir Thomas (1503–42), was the first writer of English sonnets, and a poet who did much to develop the earlier forms of verse

Wyatt, Sir Thomas (" The Younger ") (c. 1520–54), joined with the Duke of Suffolk in favour of Lady Jane Grey and against Queen Mary, son of the last-mentioned. Led the men of Kent in rebellion on London in 1554, but was captured and executed

Wycherley, William (1640–1715), English Restoration dramatist, a master of satiric comedy. His plays include *Love in a Wood*, which won him the favour of the Duchess of Cleveland, mistress of Charles II, *The Plain Dealer*, and his masterpiece *The Country Wife* His marriage to the Countess of Drogheda lost him court favour.

Wyclif, John (c. 1324–84), born in Yorkshire, educated at Oxford, and one of the most eminent ecclesiastics of his time. He adopted principles many of which became general at the Reformation, and brought down upon himself the bitter enmity of the Roman Catholic leaders, and would probably have been put to death but for the protection of John of Gaunt. While in comparative retirement as Rector of Lutterworth, in Leicestershire, he finished his translation of the Bible

Wykeham, William of (1324–1404), was Bishop of Winchester from 1366 to his death, and from 1367 to 1371 Lord Chancellor. He was a man of great learning and an excellent preacher, and wielded great influence. He founded New College, Oxford, in 1379 and Winchester College in 1382.

Wyllie, William Lionel, R A. (1851–1931), an English marine painter who excelled in the draughtsmanship of seafaring craft of all kinds, and also won a high reputation as a water-colourist and etcher. His picture, *The Thames Below London Bridge*, was bought by the Chantrey Bequest. Among his other well-known works are *The Battle of Trafalgar*, and *The Port of London*.

Wyspianski, Stanislav (1869–1907), great Polish poet, dramatist and painter.

X

Xavier, St. Francis (1506–1552), the apostle of the Indies, was the follower of Ignatius de Loyola, and devoted his life to missionary work in the East. He was canonised in 1622

Xenophon (444–359 B C.), the Athenian general and follower of Socrates. His chief works are *Anabasis Hellenica*, and *Cyropœdia*.

Xerxes (*circa* 519–465 B C.), King of Persia, was the son of the first Darius and a great commander. In 481 B C. he started on his famous expedition against Greece when, according to Herodotus, he had a combined army and navy of over two and a half million men. He defeated the Spartans at Thermopylae, but his fleet was overcome at Salamis. He reigned from 485 to 465 B C. and met his death by assassination.

Ximenes de Cismeros, Francisco (1436–1517), Spanish statesman and Cardinal who reformed the Franciscan Order to a great extent, and in 1502 began to direct the preparation of a polyglot bible, the *Complutensian*, which greatly influenced subsequent versions In 1506 was made Regent for Queen Juana, and raised to the cardinalate in 1507. Personally conducted a military campaign in Africa in 1509, and afterwards became Inquisitor-General, and in 1516, Regent of Castile, but in the following year was dismissed by the Emperor Charles V.

Y

Yeats, William Butler (1865–1939), Irish lyric poet and dramatist and major figure in the Irish literary revival of the 20th century. With Lady Gregory and others founded the Abbey Theatre in Dublin, for which he wrote many plays. Interested in mysticism and the occult Member of the Irish Senate, 1922–28, awarded Nobel Prize in Literature in 1923. Some of his best work was written in his later years in *The Tower* (1928) and *Last Poems* (1940) Plays include *Cathleen Ni Houlihan* (1902), *The Hour Glass* (1904), *Deirdre* (1907).

Yonge, Charlotte Mary (1823–1901), author of over 120 novels, school books, and other works, including *The Heir of Redclyffe*, *The Daisy Chain*, *The Dove in the Eagle's Nest*, and *The History of Christian Names*.

Young, Brigham (1801–77), Mormon leader, and head of the Latter Day Saints of Salt Lake City. At his death he had seventeen wives

Young, Francis Brett (1884–1954), British novelist. His books include *My Brother Jonathan* and *Doctor Bradley Remembers*.

Young, James, F R.S (1811–83), a Glasgow chemist who discovered the method of distilling oil from shale, and founded the mineral oil industry of Scotland, which led to the development of petroleum concerns.

Young, Thomas (1773–1829), one of the most versatile geniuses in history, descended from a Quaker family of Somerset. Studied languages, medicine, and held the Professorship of Physics at the Royal Institution. In 1804 elected Foreign Secretary of the Royal Society. He was very successful in deciphering Egyptian hieroglyphics and was the first to translate the inscription on the Rosetta Stone. Famous for his share in establishing the undulatory theory of light and for his work on physiological optics.

Younghusband, Lt.-Col. Sir Francis Edward, K.C.S.I., K.C.I.E. (1863–1942), soldier, explorer and writer. Wrote many works on the East. Headed the British Mission to Tibet, 1903–04. Was *Times* correspondent with the Chitral expedition. Pres. of Royal Geographical Soc., 1919–22.

Ypres, 1st Earl of, P.C., K.P., G.C.B., O M., G.C.V.O., K.C.M.G. (1852–1925), entered Navy in 1866, afterwards passing into Army in 1874, making his mark as a Cavalry officer in the Egyptian campaign of 1884, served in South African War with brilliant success. C.-in-C British Forces in France, 1914–15; C.-in-C Home Forces, 1915–18; Lord Lieut. of Ireland, 1918–21.

Ysayé, Eugène (1858–1929), Belgian violinist and conductor, noted chiefly for his playing of the works of Bach and César Franck.

Yukawa, Hideki (b. 1907), Japanese physicist, who received the 1949 Nobel Prize for predicting the existence of the meson. Prof. of Physics at Kyoto Univ since 1939

Z

Zadkiel (the angel of Jupiter in Jewish rabbinical lore) was the name assumed by **Lilly** (1602–81) the astrologer, and also by **Richard James Morrison** (1794–1874), Hebrew scholar and amateur astronomer, in the almanack known as Zadkiel's Almanack and first issued in 1831.

Zadkine, Ossip (b. 1890), French sculptor, one of the greatest of our time, whose works include *Orpheus*, *The Return of the Prodigal Son*, *The Birth of Forms*, *Poet*, *Harlequin*. Exhibition at Tate Gallery, 1961.

Zaharoff, Sir Basil, G C B , G B.E. (1849–1936), was an influential Greek banker and financier who became an armaments magnate, supplying the Allies in the first world war.

Zamenhof, Ludwig Lazarus (1859–1917), Polish linguist who was by profession an oculist, but gained fame as the inventor of Esperanto.

Zeno of Citium (c. 340–264 B C) was a Greek philosopher who founded the Stoic system.

Zeppelin, Ferdinand, Count von (1838–1917), inventor of the huge dirigible airship bearing his name. His first ascent was in 1900. He organised a Zeppelin service for the German army in the war of 1914–18, but their extreme vulnerability militated severely against their usefulness.

Zeromski, Stefan (1864–1925), great Polish novelist, poet and playwright

Zhukov, Marshal of the Soviet Union Grigory Konstantinovich (b 1895), led the defence of Moscow and Leningrad during second world war; served on Allied Control Commission in Germany; C-in-C. Land Forces and Deputy Minister of Armed Forces of Soviet Union, 1946–55; succeeded Marshal Bulganin as Defence Minister, 1955–57.

Zhukovsky, Vasily Andreyevich (1783–1852), Russian poet whose original work had very important influence on Russian literature.

Zola, Emile Edouard Charles Antoine (1840–1902), was the son of an Italian engineer, and came before the public as a novelist in 1867 with *Thérèse Raquin*. He then conceived the idea of a series of novels which should depict the history of a Second Empire family in various realistic phases, and began the series with *La Fortune des Rougons*, in 1871. In 1877 he made a higher success by *L'Assommoir*. From that time every novel he published had an immense sale.

Zorn, Anders Leonhard (1860–1920), was a noted Swedish painter, etcher and sculptor.

Zoroaster, the Greek form of the name of the Persian prophet, Zarathustra, who lived about the seventh century B C. He was a monotheist, believing in a good and holy God whom he called Ahura Mazda. Many of his teachings were absorbed by the ancient Persian religion which survives today among the Parsees in India

Zoshchenko, Mikhail (1895–1958), Russian writer whose humorous short stories, satirising the Soviet way of life, were wildly popular throughout Russia in the 1920s. Several have been translated and published in England.

Zosimus (fl. c. A D. 300), the first known alchemist. He lived in Alexandria.

Zuccarelli, Francesco (1702–88), a very celebrated Italian artist, who came to England, succeeded, made a handsome fortune, and was one of the first members of the Royal Academy.

Zwingli, Ulrich (1484–1531), was one of the ablest of the Swiss Reformation leaders.

Zwirner, Ernst Friedrich (1802–61), an eminent Silesian architect. Restored Cologne Cathedral.

Background to Current Affairs

This section is in two parts. The first is a narrative of some of the major events of the post-war years, intended to put into perspective some current political and social problems. The second part is mainly a description of national institutions and international political organisations.

TABLE OF CONTENTS

Background to Current Affairs

I. SURVEY OF POST-WAR EVENTS

THE main features are the expected ones—the bomb and nuclear weapons, the crippling cold war, the emergence of Asia and Africa, the changing Commonwealth, the threat of famine, the explosion of population, world poverty. At home, our attitude to science and education, to defence of this country, to crime, racial and religious intolerance, broadcasting. Beyond that we look at the changing rôle of women, the domestic revolution, and at our social groupings. And behind it all is the hope that two things may happen: that we may have the good sense to avoid the disasters which threaten us, and the imagination to use science for the well-being of mankind.

In the following pages we have referred freely to some of the excellent source books for further reading. This community is uncommonly rich in societies of all kinds standing ready to provide just what the inquirer wants to know, and a list of such societies is to be found at the end of Part II.

1. BRITAIN: POLITICAL BACKGROUND

The End of Another War. The way the British people greeted the end of the Second World War was markedly different from their feelings in 1918. The First World War had ended almost as suddenly as it had begun, and there was then an explosion of relief and rejoicing of a kind which has not been seen since. After all, that was a "war to end war." It could never happen again. England was to be a land "fit for heroes to live in." The outbreak of the war in 1914 had been a sudden shock to a world confident of peaceful evolution. The British people, having seen it through, were again confident that nothing like it could recur. The instant reaction when the end came was therefore one of delirious relief. The mood at the end of the last war, however, was very different. That war came gradually but relentlessly all through the 'thirties and it ended gradually too. We were in a sense at war long before it formally started, and at the end there was no clear emergence into a cloudless era of assured peace and progress. To maintain peace a continuous effort was seen to be necessary. Ideas had played a much greater part in sustaining men and women in the second great war than in the first, their sense of responsibility had grown so that the mood when the end came on 8 May 1945 was more questioning and cautious than in November 1918. Further, the second great war had touched everyone more directly—the bombing of cities, the imminence of invasion, the food shortages, the evacuation of school children, all this had spread the impact, and, when it was over, the mood was one of sober resolve.

The Age of Bewilderment.—Before we continue our narrative let us take a backward glance at the years between the wars, not to describe the events, which included the emergence of authoritarian tyrannies and a world-wide economic crisis, but to mark some of the moral characteristics. It was said to be a period of disillusionment, of moral and intellectual decay. There was the loss of faith in democracy; a sense of aimlessness reflected in the arts, a good deal of confusion and uncertainty about values, and, above all, insecurity. That there was this political apathy and bewilderment is true, but much to the contrary is true also. This was, after all, the nation which had won the war and, by resolution and will, was to win the next. The nation faces difficulties again. We shall see later that these difficulties seem hard to diagnose but we shall try to disentangle in this story the elements in what has been called our social malaise.

The First Atomic Explosion.—Momentous events were to come. The war with Japan was not yet over. Although the secret was kept at the time, the first full-scale atomic bomb explosion was made in the Mexican desert in July 1945 through the concerted efforts of a team of scientists working in America. The bomb was detonated at the top of a pylon 100 feet high and a space of ten miles cleared. Devastation inside a one-mile circle was absolute. It offered a means to a speedy end of the war with Japan. It has proved to be the first of a series of tests of increasingly powerful bombs which pose the greatest threat which has ever faced mankind and may yet destroy civilisation. A few days later the United States and Great Britain called for unconditional surrender by Japan and upon its rejection a bomb was dropped on August 6 on Hiroshima and a second on Nagasaki on August 9. The surrender terms were then accepted. Churchill in his account of the war describes his own view that there should have been no rigid insistence on "unconditional surrender." "It would be a mistake", he writes, "to suppose that the fate of Japan was settled by the atomic bomb. Her defeat was certain before the first bomb fell."

The Face of the Post-war World.—Far-reaching changes mark the decade which ended with the Suez affair of 1956. Asian countries, driving towards independence, reached their objectives, and a similar drive in African countries was gathering momentum. The war had impoverished Britain and France, which could no longer be powers great enough to follow an independent course, and they both played rôles, although different ones, in launching Western Europe towards unity. The victors of the war quarrelled and this vitiated the working of the United Nations, which had been founded on the hope that the victors would not quarrel—not, at any rate, so profoundly that we should no longer have a state of peace but a condition given the frank but dispiriting title of "the cold war." The direct confrontation of the two great Power blocs—the United States and the Soviet Union—was therefore a cardinal feature of the decade, with the development of atomic weapons. The competition in armaments was matched by another competition in economic power. Both sides made a bid for the support of the new Afro-Asian countries, and it was seen that what attracted those countries was naturally the technical means to satisfy hunger and to secure clothing, shelter, and the materials with which to live. Russia, therefore, turned increasingly to the training of scientists and technologists in the drive towards industrialisation and economic growth, likely to comfort the peasantries of the new continents.

Estrangement between West and East.—The war had engendered friendship between Western Powers and Russia. Why did they so quickly fall apart with the defeat of the enemy—a fact which was to transform the history of the world? The fact was that relations were reverting to their pre-war state of hostility. Nazi Germany had divided the West from Russia; Russia had been suspicious of our appeasement of Germany which might liberate her for attack eastwards. And when, eventually, Russia and Germany signed a non-aggression pact in 1939, which freed Germany

to turn west instead of east and to attack us, our hostility towards Russia naturally deepened. Popular feeling changed when Hitler invaded Russia in 1941 but co-operation between Western and Soviet leaders was not so close as to prevent ill-feeling—one cause of mistrust being the Russian belief that our invasion of Europe was being unjustifiably delayed. When the war ended there was still an abundance of goodwill towards Russia. But a number of political facts worked the other way. The Russians had taken a hold over a number of countries in the eastern half of Europe; and this led to the establishment in those countries of communist régimes. Were the ideas of Russia necessarily antagonistic to the West? They were certainly incompatible In Stalin's view, especially after his experience of Germany's invasion, there could not but be hostility from the West This sense of suspicious defensiveness made Soviet foreign policy complex and enigmatic. Whatever the reason might be, Russia's policy followed a course which could not be easily understood, and the goodwill towards her was allowed to evaporate.

The Bomb.—In the first years of the decade the Red Army was supreme on the ground in Europe and Asia and the U S Air Force supreme in the air. It was the Red Army versus the atomic bomb But in September 1949 the Soviets exploded an atomic bomb and the four years of American monopoly was over The race for bigger bombs intensified. The United States exploded a hydrogen bomb in November 1952 and Russia followed in August 1953. The new weapon was different not only in degree but in kind. The killing effects were incalculable, and the after-effects on future generations unpredictable. Eisenhower said there was no alternative to peace, but no solution was reached on practical issues—on the two Germanys, on the status of the satellite countries in Eastern Europe, on the future of the Middle East The post-war world disintegrated Neutralism was seen as the only hope of survival by those countries where pent-up forces of nationalism were being released

The Technological Race.—The race between Russia and the West was not a new one; Professor Toynbee has pointed out that it began in 1700 when Peter the Great created a strong country against invaders who had deprived her earlier of so much. Russia, defeated in the first great war, made a new start in 1917 when she threw communism (a creed borrowed from the West) into the scale. She drew ahead and after a long and bitter struggle beat the Germans in 1945 as Peter the Great had driven Russia ahead, eventually beating the French in 1812 With the American success with the atomic bomb Russia fell behind again, but she resumed the race with the West and was first with an earth satellite (1957) and a manned satellite (1961) In their technological breakthrough in 1957 the Russians developed the first inter-continental ballistic missile. The see-saw continued and, in 1961, the Americans perfected the cheap, quickfiring ICBM, the Minuteman.

The Creation of the "Satellite" States.—The satellite states, as they are known, were set up by Russia in the countries of Eastern Europe which had been occupied by Russia in the final stages of the war This occupation had been made militarily easier when the Americans, in August 1944, had withdrawn 100,000 men from the Italian campaign for a seemingly needless invasion of the south of France. The states were Czechoslovakia, Poland, Roumania, Albania, Hungary, Bulgaria, and Yugoslavia—all, except Hungary, inhabited by peoples mainly of Slav race Yugoslavia, however, eventually broke away under its national leader, Marshal Tito, though the country remained communist. At the Yalta conference of February 1945 attended by Roosevelt, Churchill, and Stalin, Russia had agreed that democratic governments should be set up in eastern Europe. But the transformation of the countries to communist régimes began very shortly afterwards and by 1948 was complete.

The Cold War and the West.—The failure of the nations to make treaties of peace or arrangements for general disarmament, and the continuing loss of confidence between Russia and the West led to an increase of armaments and defensive pacts by both sides. In the West rearmament was carried out by the U.S.A. and Western Europe on the lines of an agreement made in 1949 and known as the North Atlantic Pact. They formed the North Atlantic Treaty Organisation (NATO), the first supreme commander being Eisenhower, who afterwards became, for two terms, President of the United States (being succeeded by Kennedy in 1961) The Russians, on their side, organised the Communist countries by a "Warsaw Pact" It is refreshing to note that Austria, by agreement in 1956, established a democratic republic, to be permanently neutral like Switzerland. In Asia a number of countries which met at Bandung in Indonesia in 1955 with some African countries decided to keep neutral Four Asian countries, however (Turkey, Iraq, Iran and Pakistan), neighbours of Russia, formed a defensive pact with Britain—the Baghdad Pact (later to become the Central Treaty Organisation or CENTO). Some countries bordering the East and South Pacific, including Australia and New Zealand, formed the South East Asia Treaty Organisation or SEATO for mutual defence against the Communists.

The General Election of 1945.—This election was quiet, conducted on an out-of-date register but with a postal vote for the Forces A lively issue had been introduced by Churchill, who declared that if the Labour Party won the election Attlee, as Prime Minister, would be under the control of Harold Laski who was then chairman of the national executive of the Labour Party This declaration stemmed from a statement which had been made by Laski that the Labour Party would not be bound by any commitments entered into by Attlee when, as leader of the Labour Party, he accompanied Churchill to the Potsdam conference with Stalin and Truman in June. A correspondence of increasing bitterness followed between Churchill and Attlee who asserted "The Chairman has not the power to give me instructions" Attlee seemed on surer ground in the interpretation of the constitution of his own party. The popular impression was that the matter was an election scare devised by Churchill's campaign advisers The Labour Party had a dramatic victory, 393 Labour M P s being returned, with a clear majority over all other parties They did not have a clear majority among the voters, the Liberals holding a balance But the bias present in the constituency system worked in favour of the Labour Party

The Resignation of Churchill.—Ordinarily Churchill might have been expected to take a few days to wind up the affairs of the Government This would have enabled him to present the unconditional surrender of Japan to the nation But two factors led him to resign at once and advise the King to send for Mr Attlee These factors were the need for Britain to be represented with proper authority at the Potsdam conference where great issues were coming to a head, and the overwhelming nature of the verdict of the electors. He thanked the nation that day for the "unflinching, unswerving support" which they had given him in his task in the war and "for the many expressions of kindness which they have shown towards their servant"

Churchill's Premonition.—There is a moving story in the last volume of Churchill's work *The Second World War* of his sudden premonition of electoral defeat. On 25 July 1945 he flew home from Potsdam and went to bed, accepting the view of the Conservative Party managers that the British people would wish him to continue his work and that it would be possible to reconstitute the National Coalition Government in the proportions of the new House of Commons. On that belief he slumbered. "However, just before dawn," he writes, "I woke suddenly with a sharp stab of almost physical pain. A hitherto

subconscious conviction that we were beaten broke forth and dominated my mind. . . . The power to shape the future would be denied me . . I was discontented at the prospect, and turned over at once to sleep again." When he awoke the first results had begun to come in and they were, as he now expected, unfavourable By noon it was clear that the Socialists would have a majority. His wife said to him, "It may well be a blessing in disguise," to which he replied, "At the moment it seems quite effectively disguised."

The Causes of the Conservative Defeat, 1945.—Looking back nearly twenty years after it must seem puzzling that the country could have been so ungrateful to the man who had pulled the nation through tragedy to triumph But the people were not ungrateful Their verdict was registered, rightly or wrongly, against the Party which had excluded Churchill from office during the pre-war years The verdict was directed against the Conservatives despite the admiration for Churchill It was they, not he, who were condemned for the Munich Agreement and for the pre-war unemployment There was also an undercurrent of concern that events might follow the pattern of the First World War when the war leader, Lloyd George, was re-elected on generous promises which were not fulfilled

Labour Faces a Financial Crisis.—On coming to office in 1945 the Labour Government was faced with the end of the financial assistance given to Britain during the war by the United States under the system known as Lend-Lease (L69) The Government accepted a dollar loan but the money ran out by 1947 Stafford Cripps was appointed Minister of Economic Affairs to deal with the crisis and, in the autumn, when Dr Hugh Dalton resigned as Chancellor of the Exchequer after an indiscreet Budget disclosure to a journalist, he combined both posts Cripps had been a brilliant lawyer before entering politics He was now master of the economic affairs of the nation He introduced a programme of austerity in order to reduce the demand for foreign currency, and the trade unions cooperated by accepting a policy of "wage restraint" This co-operation was willingly accorded because Cripps controlled prices, maintained an equitable taxation system and because of the social services which the Government had introduced

The Marshall Plan.—Assistance to Britain came in a new way In 1947 George Marshall, U S Secretary of State, proposed a scheme whereby his country would assist in a programme for putting Europe on a sounder economic basis The programme would need to be a joint one, agreed to by a number, if not all European nations; and the initiative must come from Europe, the United States giving friendly aid and support Ernest Bevin, Foreign Secretary, jumped at the offer and with fifteen other nations drew up what became known as the European Recovery Programme The Organisation for European Economic Co-operation which, of course, is still in being, came into existence to administer the programme

Bevin and America.—Bevin worked increasingly for effective collaboration with America and he was a prime mover in creating the North Atlantic Treaty Organisation (1949) This was the first treaty in which the U S A had ever undertaken European commitments in peace time It grew out of fear of Russian power Bevin's policy was criticised by some members in his own party Criticisms varied One was that Bevin had abandoned a specifically socialist foreign policy and that he should have attempted to retain independence between the two worlds—the capitalist and communist worlds—and tried to build a bridge between them. This view was crystallised in the advocacy of a "third force" of powers standing between America and Russia and led by Britain. The group expressing this view were known as the "Keep Left" group, and it was about this group that Bevin made the often quoted remark that he had been "stabbed in the back." The members of this group of "Labour Independents" were defeated in the 1950 election.

The Work of the Labour Government, 1945–50.—The first measure was the nationalisation of the Bank of England which Churchill said did not raise any question of principle and there was little opposition The National Coal Board, established as a public but semi-independent body, took over a very inefficient industry. The British Transport Commission was created in 1947 and took over railways, canals, and road haulage. Cable and wireless companies were nationalised and public corporations created to run airlines. In these measures the new Government were following the lines of policy accepted by earlier governments. The creation of the British Electricity Authority (1948) and the Gas Council (1949) enabled management to be taken of industries which were already under some public control Beyond all this the Government built a "welfare state" in which the social services were no longer regarded as a form of poor relief but as a co-operative system of mutual aid and self-help provided by the whole nation and designed to ward off distress and strain wherever they may fall At the centre of the system were the social insurance scheme and the national health service

The Controversy over Iron and Steel—The question of the nationalisation of this industry proved controversial and difficult It was left to the last by the Government The industry, which was profitable and fairly efficient, was also very complex, ownership penetrating into industries other than engineering Therefore the Government considered creating a Board of Control instead of imposing nationalisation It was in order to gain time for preparing an appropriate measure that the Government passed an Act which cut down the period during which the House of Lords could delay the passing of a Bill from two years to one The nationalisation of iron and steel took effect in February 1951 (by the administration formed after the general election of 1950 when the overall Commons majority of the Labour Party was reduced to only six), but the Conservatives, returned to power in 1951, denationalised the industry

The National Health Service.—This welfare service was created by the Labour Government's National Health Service Act of 1946 and became operative in 1948 It provided all those who take advantage of it with free medical and hospital treatment The cost is met partly by contributions from general taxation and partly by compulsory contributions from all citizens (except certain exempted persons) and these contributions are payable whether or not advantage is taken of the service In 1949 90 per cent of the cost was borne by taxes but by 1961 this had dropped to only 70 per cent Aneurin Bevan who as Minister of Health had piloted this great scheme through all its stages, resigned when the Labour Government imposed charges on spectacles and teeth in 1951 although this was intended only as a temporary measure Since then, however, governments have continued to increase general charges—on prescriptions, on contributions, on spectacles, dentures, welfare foods, and amenity beds

The Guillebaud Inquiry.—The Guillebaud Commission which the Government, anxious about the cost of the health services, had set up, reported in 1956 that it was unable to say that the cost was too high Nobody, they thought, could say the cost was excessive, since how much should be spent on a public health service was a political decision, similar to how much should be spent on education Did we want better health and better education or better motor cars and refrigerators? Did the State propose to play a greater or a smaller part in promoting health? If, as it was said, we could double our standard of living in 25–30 years we had a clear choice how to spend our increased wealth The Committee found that the cost of

the Health Service in relation to our total income was going down, not up It went further: it recommended the removal of the charges on spectacles and dentures and increased capital spending on the Health Service.

Our Hospitals.—The Health Service uses some 2,800 hospitals, most of them obsolete as buildings, no matter how seemingly good the service they give. Nearly half of them are over seventy years old, and a quarter are over 100 years old Most of them fall below modern standards In the last twelve years we have spent only £13 million a year on capital programmes and a good deal of that has gone in repairing or modifying old buildings. Dr. Brian Abel Smith has pointed out that if we were to find ten years in which less had been spent on hospital building than in the ten years up to 1961 we should have to go back to before 1870. The proposal to spend £500 million on building in the next 10–15 years is a great improvement. But this has to be seen against the arrears and backwardness Much more money and urgency of drive are needed to catch up with the problem The Service is starved of capital equipment It will help us to maintain some perspective if we recall the cost of the dozen major government-financed guided weapon programmes which have been abandoned before completion, as described elsewhere, *Blue Streak* alone having consumed £100 million before being abandoned as a military weapon.

The Continuing Needs of a Welfare Society.—Writing a decade and a half later we can see that social services can never be finished articles A school of writers led by Professor Richard Titmuss have recently shown that some groups have benefited far less than others from the recent increase in production and that behind the façade of affluence there are "submerged groups" Serious social problems remain like the adequate care of the aged, housing and unemployment caused by economic and technical changes The subject of the care of the aged becomes more urgent every year—since 1948 the number of people over 75 in England and Wales has increased by 27 per cent. We refer later to the problem of redundancy.

Labour and Asia.—The granting of independence by the Attlee Government to India, Pakistan, Ceylon and Burma was of the greatest importance Seen at the time as a historic achievement, the passage of time has confirmed its momentous nature It is difficult to contemplate into what tragic paths we might have fallen had independence for India been further delayed. Independence to countries is very rarely given too soon How easy it is to see now that Britain would have benefited enormously—and the wider world too—had a settlement between her and Ireland not been tragically delayed The clock of progress was put back fatally. We were spared further conflict with our Asian dependencies by the decisive action of Attlee in sending Lord Mountbatten to India as the last Viceroy in order to transfer power to the Indians. Of the four new states in Asia only Burma elected to sever its links with the Commonwealth (An outline of the developments in India since her independence is given later.)

The Changing Commonwealth.—At this point we may glance ahead at the further evolution of the Commonwealth which followed the grant of independence to the Asian countries—a step criticised vehemently at the time but now seen to have been wise. As other countries in the Commonwealth reached sovereign status most of them sought full membership, so that there were welcomed to membership Ghana and Malaya in 1957, the Federation of Nigeria in 1960, Cyprus, Sierra Leone and Tanganyika in 1961, and in 1962 Jamaica, Trinidad, and Tobago, followed by Uganda. Thus we have a system which bears no resemblance to the empires of the past, a partnership based upon friendship between nations with a diversity of race, religion, and language. This evolution we are now beginning to take for granted; but it must not be forgotten for it is one of the most heartening features of our time. It would be consonant with Britain's fine record in other parts of Africa if she announced that independence would not be granted to Southern Rhodesia while a white minority remains in complete control. *See also* **Part II.**

Labour Faces the Country, 1950.—During the whole of its term of office, 1945–50, the Labour Government had not lost a single by-election But the general election of 1950 gave the Labour Party only a very slight majority They secured only 315 seats, against 298 Conservatives, 9 Liberals, and 2 Irish Nationalists A considerable defection of middle-class voters resulted in suburban seats in London and the Home Counties returning to Conservative allegiance Dissatisfaction with continued shortages and with rationing no doubt played a part The redistribution of seats due to poulation movement had resulted, in 1950, in an electoral system with a slight bias against the Labour Party since support in working-class areas was so strong as to bank up enormous Labour majorities there, whereas the Conservative vote was more diffused and thus more effective in electoral figures. The result ended Labour's effective control of Commons Government was scarcely possible with a majority of six and the parties renewed their fight at another election which Attlee called in October 1951.

Controversy in Labour Ranks.—No political party—or indeed any organisation or institution—can thrive without vigorous discussion of policy This applies particularly to a party advocating changes It is simpler to stand still than to go forward There is greater probability of difference of view when it comes to making a change than when an existing course is being broadly maintained In October 1950 Gaitskell, at the age of 44, succeeded Cripps as Chancellor of the Exchequer Next year the Government, having to find money for a rearmament programme necessitated by the Korean war, decided as a temporary measure to put charges on National Health dentures and spectacles. As a protest Aneurin Bevan, then Minister of Labour, and Harold Wilson, President of the Board of Trade, resigned The dissidence of Bevan's followers intensified as time went on They were called Bevanites or sometimes, because of their number and diversity of outlook, "57 varieties" They also differed from their party on defence and on the issue of German rearmament.

The Conservatives Regain Power. 1951.—The Labour Party secured the highest total poll that it or any other party had received in a general election—fourteen million votes The Conservatives received a quarter of a million less; but they secured a majority of seats This anomaly was due to the character of the electoral system described above The composition of the new House was 321 Conservatives, 295 Labour, 6 Liberals and 3 Irish Independents. In the atmosphere of relaxed responsibility the controversy which had begun within the Labour Party while they were in power was renewed.

Churchill at Eighty.—No Prime Minister had been so honoured as when members of both Houses assembled in 1954 in Westminster Hall to present to him a book signed by them and a portrait of him by Graham Sutherland A memorable description of the scene is reprinted from *The Guardian* in "The Glory of Parliament" by Harry Boardman—the throng of several thousand, the drums of the Guards' band beating the opening bar of the Fifth Symphony, which Churchill had so memorably converted into a victory sign ten years earlier He disclaimed having inspired the nation in the war. He had had only to appeal, he said, to the remorseless, unconquerable will of the people. "It was the

British race that had the lion's heart I had the luck to give the roar "

Eden Succeeds Churchill.—The new Prime Minister, Anthony Eden, who succeeded Churchill in April 1955 decided upon a general election, thus taking advantages of two factors, the controversy within the Labour Party and the economic recovery at that time. There were also, at the time, a number of strikes or threats of strikes which affected a wide public and these disputes were unfortunately due in part to inter-union rivalries The Conservatives increased their majority from 17 in 1951 to 58

The Election of 1955.—The Conservatives had a total of 345 M P s, Labour 277, Liberal 6 and Sinn Fein 2 Both the Conservative and Labour votes fell—the first by some 400,000 and the latter by over 1 5 million When Parliament assembled four older members, including Dalton, resigned because of their age from the Labour Shadow Cabinet, and when at the end of the year Attlee resigned the leadership, Hugh Gaitskell was elected leader of the party by a substantial majority The Labour Party was more solidified as a result of the Government's Suez adventure and Bevan was brought back as " Shadow Foreign Secretary "

Attlee's Achievement.—Attlee, who thus retired from the leadership of the Labour Party, went to the House of Lords as Earl Attlee If Churchill stood for the " finest hour " in our history, Attlee stood for the social revolution which followed it He was the most modest man ever to engage in politics As a young man he had gone to the East End of London to take up social work and had become Mayor of Stepney. Nobody then could possibly have imagined that he would one day become Prime Minister and Churchill's Deputy Prime Minister for five years of war. " The difference between the two," wrote Harry Boardman (who described the Parliamentary scene so brilliantly for many years for *The Guardian*), " is between genius and extraordinary ordinariness " " True there is no colour, no magnetism, but there is great concentration of purpose, a mind with a razor edge and something of harsh resolution " This simple man of few words transformed the social and economic fabric of the country and changed the face of the Commonwealth into the beneficent world-wide system it has become.

Conservatives' Third Consecutive Victory, 1959.—During the 'fifties the Labour Party had to endure the loss of three consecutive elections and a loss of increasing margins In 1959 after eight years in office the Conservative Party secured the return of 365 Conservative members, with 258 Labour and 6 Liberal members and one Independent It was at this election that the Liberals doubled their share of the vote partly by running more candidates and partly by the increase of votes in many of the contests in which they took a part.

The Conservative's Aims were to maintain security and prosperity and the Government were especially concerned so to control expansion as to avoid an inflation which would disrupt orderly progress. Partly with this object it set up two organisations popularly called Neddy and Nicky The first, to advise upon economic development, is explained in **Section G, Part III.** The Government decided in 1961 that it would be to Britain's advantage to gain admission to the Common Market but after prolonged negotiation this hope, on which so much was staked, was destroyed by France's veto in 1963. On Africa Mr Macmillan harnessed " the wind of change " to steer a number of countries towards emancipation.

A new chapter opened in British politics when, in February 1963, Mr. Harold Wilson became leader of the Labour Opposition after the untimely and lamented death of Mr. Hugh Gaitskell.

The National Incomes Commission (Nicky).—After the drastic reconstruction of his Government in the summer of 1962 when Mr Macmillan dismissed about a third of his ministers, he appointed a permanent body to inquire into and express views on wage claims of special importance. The intention was to consider pay claims and disputes which may be referred to the Commission by agreement of the parties concerned, or the Government may decide that it should itself consider the matter in the public interest The Commission would take into account not only the circumstances of each claim, but also the wider considerations of national interest. This was an aspect of the Government's desire to secure a more realistic relation between the rate of increase in incomes of all sorts and the growth of national production. It was not intended that the Commission would override existing arrangements for negotiation and arbitration and it would work by exhortation. The Commission was to work in public and deal with questions of pay in the private and public sectors alike. *See also* **Section G, Part III.**

Attitude of the T.U.C. and Others.—The T.U C. strongly opposed the Government's decision on the ground that it was the duty of the Government to say when the interest of one section of the community conflicted with another. In their view it was not possible for independent people, however eminent, to take on their shoulders the task of saying that in the public interest, despite the merits of a particular case, they do not think it right to give an increase In other quarters it was said that a central body to run a national incomes policy would be a boon if it could be achieved But its workings would need to rest on the consent of both sides of industry, it must be seen to be fair, it must be part of a comprehensive social and economic policy aimed at more than mere restraint of wages, and it must promote economic growth

Redundancy of Workers.—By November 1962 more than half a million people in Britain were unemployed—the highest since 1959—and the trend was rising, the number of workless being highest in Scotland, the North of England, and Northern Ireland It was seen that a new challenge had arisen to our social security. Scientific developments such as automation, by eliminating jobs and radically changing the work involved, must obviously make for unemployment, although its incidence may be deferred by expansion It is good that toil should be saved, that would be generally accepted as a boon in a society in which work and leisure could be shared and there was general security But unemployed men, having no security, do not see things in that way and they have reason for alarm It is clear that our second industrial revolution, which has been created by automation, requires a new approach to economic planning—planning for the safeguarding of human resources as well as for the development of physical ones A new social programme is necessary and for this various strands of national planning need to be brought together—location of industry, housing, social insurance benefits and retraining. Here, as in some other problems, time is vital because not only is technical change rapid but the rate of change is surpassing most predictions.

The Drift from North to South.—The growing unemployment in the North is part of a larger phenomenon—a drift of population from the North to the South of England. In the last ten years more than 500,000 people have moved south of the Trent, and during the same period the rate of increase of population in the South has been six times the rate in the North. It was clear that industry in North-west Europe was concentrating into what is called the Golden Triangle, the region between sides of a triangle drawn from Birmingham — Paris — the Ruhr — Birmingham. The relationship between North and South of Britain not only in industry but in every aspect of life was seen to be a problem of increasing importance.

2. WORLD PROBLEMS AND EVENTS

The Threat of Famine.—The world might have thought itself entitled to a little more relief from anxiety than it got So soon after the war as 1946 famine was imminent. There was fortunately the very man at hand and ready to act—John Boyd Orr. Boyd Orr was an expert in nutrition who had long devoted his immense courage and drive to the feeding of the hungry. He had fought malnutrition in Britain in the 'thirties when destitution had followed unemployment He had then driven home the fact that 50 per cent of the population (1933–4) did not have an income which would guarantee them the diet necessary for well-being. For the bottom tenth—4·5 million and they included the miners of South Wales—there was only malnutrition. Something similar was true of other countries including the United States, the richest of all It was because of Boyd Orr's scientific facts and his powerful public pleading that it was possible to introduce, so early in the war, a rationing system for food And because of fair shares and nutritional knowledge Britain came out of the war a healthier nation than she had been at its outbreak six years earlier In 1946 however the world faced a famine situation That, in the event, there was no widespread famine was due to Boyd Orr who, as head of the Famine Conference of that year, induced the nations to accept self-denying ordinances Britain reimposed rationing Out of that threat of famine, which might have cost 75 million lives, came the idea of a World Food Board

The Idea of a World Food Board.—The Famine Conference was concerned that a similar world threat should not recur Boyd Orr was therefore asked to plan a permanent body which would estimate in advance annual food requirements, ensure that adequate supplies were forthcoming, and see they were properly distributed Orr planned such a Board which would help countries to increase food production equal to human needs, build up a reservoir of food to even out good and bad harvest years, and stabilise prices, with the Board buying surplus after bumper harvests and selling after bad There was general enthusiasm among governments for the scheme, but it evaporated when it was seen that it entailed a sacrifice of a fraction of sovereignty "If nations cannot co-operate on food," said Boyd Orr, "they will co-operate on nothing." The plan had been much more than a humanitarian scheme to feed the hungry, since a development of world agriculture would call for vast quantities of industrial products and also for consumer goods to meet the increased purchasing power of food producers, who are larger than all other industrial groups. Here was a real chance to solve basic world economic problems and to bring prosperity and stability to food producers What emerged was, in the words of Professor Ritchie Calder who has told the story from personal knowledge, "a pale ghost of the original concept"—the World Food Council. The World Food Council is another name for the executive of the Food and Agricultural Organisation, which, incidentally, had been the first permanent agency of the United Nations to be established Boyd Orr retired and was awarded the Nobel Peace Prize, a recognition of what he had tried to do.

World Poverty.—The declaration of human rights adopted by the United Nations Assembly in 1948 lays down that: "Everyone has a right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age, or other lack of livelihood in circumstances beyond his control." In 1962 the United Nations set as a target for attack the doubling of the standard of living of the poor countries in 25–30 years. In 1961 the General Assembly had designated the 1960s as "The Development Decade" The attack on poverty started from a position in which the gap between rich and poor countries was widening—rich getting richer faster than the rate of progress by the poor Further there was a lack of confidence in economic matters between the West and the poor nations—neutral nations felt they were left out in the cold by the Common Market and Comecon, and India, for example, had had difficulty in raising foreign exchange for her Plans. This was not all. Other factors were running against the poor countries. All through the 'fifties they had to accept falling prices for the food and raw materials which they exported, and this was made worse by having to pay more for the manufactured goods which they imported. If they try to sell industrial goods they are confronted by protection systems U Thant, the Secretary-General of the United Nations, has said "The world will not live in harmony so long as two-thirds of its inhabitants find difficulty in living at all."

The Population Explosion—At the opening of our period (1945) the total world population was about 2,500 million; today it is over 3,000 million and increasing at a rate of 54 million a year (*see* **L123**) Not only is world population increasing but the pace is accelerating Aldous Huxley has put it this way While it took about 1,600 years, from the beginning of the Christian era to the Pilgrim Fathers, for our planet to double a population of 250 million, the world's population stands today at some 3,000 million. "By the year 2000 unless something appallingly bad or miraculously good should happen in the interval, 6,000 million of us will be sitting down to breakfast every morning" In a word, says, Huxley, 12 times as many people are destined to double their numbers in a fortieth of the time In the lifetime, therefore, of younger readers of these lines the demographic revolution, as the population explosion is sometimes called, will have completely changed the face of world politics *See also* **K197-200**

The Crisis of Population in Poor Countries.—In many of the poorer countries infant deaths remain as high, or higher than they formerly were in Europe, and in some areas they may be as high as 200 to 400 per 1,000 births Indeed, in some primitive countries one out of every two children born may fail to survive through childhood to adult life Many factors, both medical and social, have contributed to the saving of infant lives and the picture has begun to change in many Eastern countries, particularly as a result of mass attacks on the great killing diseases To give only one example, the control of malaria has saved many thousands of infant lives, and in most parts of the world the infant death-rate is falling rapidly Professor Cipolla in his stimulating and challenging book *The Economic History of World Population* (Penguin) says that in Ceylon, immediately after spraying for malarial mosquito, the death-rate fell from 20 to 14 per thousand in the single year 1946–7—a fall which took seventy years in England But—and this is the point which creates the crisis—the birth-rate does not fall, and the explosion is not therefore controlled Backward countries must do things more quickly and on a bigger scale than Europe had to do in the years of the industrial revolution And when we realise that more than half their population are illiterate we get a glimpse of the stupendous task that lies before the peoples of the world

Nasser and the New Egypt.—A new factor in the Middle East was introduced when the Egyptian Army revolted in 1952, overthrowing the monarchy, leading two years later to the emergence of Nasser as Prime Minister. In that year Nasser secured the agreement whereby all British forces were to leave the Suez Canal Zone by 1956 Egypt did not become a democracy in any Western sense but the government runs all the basic enterprises of the country. In 1956 Nasser internationalised the Suez Canal Company as a reply to the withdrawal by the United States of its offer to finance the High Dam at Aswan. The attack by the British and French on Egypt followed, causing serious disagreement with the United States, which inspired international action to rescue Egypt. (It was while we were bombing

Egypt that Russia suppressed a revolt in the satellite of Hungary.) The nationalisation of the Suez Canal and the building, with Russian help and finance, of the High Dam are the two most important of Nasser's actions

Egypt and Russia.—A new chapter had opened in 1955 when the Russians made an arms deal with Egypt By that action Russia became a Middle Eastern Power She upset the Anglo-American policy of balancing arms deliveries to Israel on the one hand and the Arab states on the other (It was all the more creditable to the United States that she was shocked by and opposed a war upon Egypt when it came next year.) Russia's influence in Egypt penetrated a Western preserve, and she leap-frogged the "northern tier" of Turkey and Iran (which, with Pakistan, had been grouped by the United Kingdom into a defensive barrier and now known as CENTO, the Central Treaty Organisation) Russia continues to pour in money, equipment, and technicians in the building of the High Dam which was begun in 1960 and should be completed by 1970

Israel.—This is an appropriate point to recapitualte the salient points about Israel Palestine, formerly part of the Turkish empire, had been ruled by Britain from 1918 to 1949 under a League of Nations mandate upon the basis of the British declaration that Palestine should be "a national home" without injury to the Arab population The Nazi persecution of Jews naturally quickened Jewish migration to Palestine and this caused strain between Arabs and Jews After the massacre of Jews by Germany during the war itself, there was naturally a stronger flow of emigrants of Jews to Palestine, and when Britain restricted this flow and tried to curb illegal immigration, tension increased between Jews and Arabs In 1947 Britain said she would surrender her mandate and asked the United Nations to find a solution, which they did But their plan to divide Palestine into Jewish and Arab states was rejected by the Arabs When Britain withdrew in May 1948 the Jews proclaimed the new state of Israel, which was at once recognised by the United States and Russia, but the country was attacked by neighbouring Arab states The Israelis successfully defended themselves, although greatly outnumbered, and in 1949 the United Nations secured an armistice

A Turning Point in Soviet History—The 22nd Congress in the autumn of 1961 proved to be unexpectedly important Mr Khrushchev publicly and dramatically completed the process, which he had begun in 1956, of drawing a line under the Stalin régime and finally rejecting the cult of Stalin This change was symbolised by the removal of Stalin's body from the mausoleum at the Kremlin At the same time Mr Khrushchev was confronted by an external challenge to his leadership of the Communist world—by China who believed that Russia was moving steadily away from classical communist doctrine

The Stalin Era.—Stalin had made the Soviet Union a modern industrial society and a great armed power But the arbitrary bureaucracy through which this had been achieved had, in Khrushchev's view, overrun itself. Radical changes became essential and Krushchev attempted various steps—the scaling down of the secret police, the rebuilding of the administrative apparatus; the opening up of virgin lands, and a new theory that war was not inevitable

The "Monolithic" Party.—The legacy of the Stalinist era had been the concept of the "monolithic" party, that is to say, a party which, however torn by internal conflict, must never allow any open division of opinion and free debate, much less the formation of any groups expounding distinctive views This concept was challenged at the 1961 Congress and remains on the Agenda of Congress. The student of affairs will therefore be interested to see whether differences on policy are allowed to be openly discussed. Differences have arisen between Russia and China, and these external differences, referred to later, cannot be covered by a cloak of "monolithicism"

A New Drive in Russia.—At the end of 1962 Mr Khrushchev discussed at a special congress fresh plans for throwing the full weight of the Communist Party into solving the country's economic problems The party will be split into "two regiments of shock troops," one for industry and one for agriculture. Local government administration was to be split, like the party itself, into an agricultural and an industrial side So far as one can judge, the general changes are, at the centre, the strengthening of party activities and the reduction of the possibility of opposition to those activities and party plans by the economic bureaucrats, and, at local level, the strengthening of non-party control, where factory production committees will be elected from non-party as well as party workers Mr. Khrushchev apparently wants to involve the whole nation and not just the party in the drive forward and to limit the possible opposition from central ministries By 1963 it was evident that there was much greater freedom for the artist

India and China—The independence and unity of India on the one hand and the emergence in China of the Central People's Republic on the other form the two most important political features of Asia Relations between them are therefore of great importance The two countries have lived, historically speaking, in different worlds, their experiences at the hands of the West have been different, their recent developments and their present political systems are entirely dissimilar—the one a democracy and the other authoritarian Yet these differences had not affected India's friendship and sympathy with China In the Cold War India has studiously refrained from being drawn to one side at the expense of the other, and this neutrality has caused her to oppose alliances such as SEATO and CENTO We give some background notes on these two countries for a fuller understanding of the momentous changes taking place in South-east Asia

Indian Changes under British Rule—India had gone through profound changes during British rule which set the pattern of her development after independence Among these were the introduction of the concept of law and the rule of law, the construction of a civil service superior to any which had been known before in Asia, the creation of a system of education which the British had introduced so far back as 1835, the emergence of English as a common language, and the growth of an intelligentsia (to use a word with a Russian origin) with a humanistic outlook and responsive to Western ideals and traditions Important consequences followed from these changes, made during the decades of intimate contact with the British First they enabled Hindu society to reform itself on the basis of modern ideas; to create an educated leadership, to modernise Indian languages, and to introduce modern science to India We owe to Sardar K. M Panikkar, Indian novelist and historian, perhaps the best analysis of the preparatory revolution in Hindu thought during British rule and the consequences which we now see in modern India This analysis is to be found in two of his books *Asia and Western Dominance* and *Common Sense about India.*

The Leadership of Mahatma Gandhi.—That the dissolution of British rule was made so peacefully, a miracle of modern times, was due principally to Gandhi who associated nationalism with ethical concepts, summed up in the term "Gandhism" and denoting pacifism, the value of the individual soul and humane ideas The struggle for independence came under his leadership—a religious leadership—for the quarter of a century following the first World War He had called for great

social changes—the eradication of untouchability among Hindus, the loosening of caste ties and full equality for women, he instilled discipline, the discipline of non-violence or "Ahimsa", and he believed in Hindu-Muslim unity He had also made India conscious of the social reforms which needed to be made when the time came and created the discipline to make a democracy able to carry them through Gandhi's ideal of religious unity, though disrupted by the partition into the two states, Pakistan and India, made it possible for the new India to be a secular state, in which all religions and minorities had equal rights.

Nehru and the Dynamics of Democracy.—Social reforms were made possible by the force of democratic decision and action India's first general election, in 1952, for both central parliament and state legislatures, was based on adult franchise and the electorate numbered 180 millions The Congress Party led by Nehru won both that election and those in 1957 and 1962. It stands for rapid and planned industrialisation, the modernisation of Hindu law and a secular state; and the establishment of a welfare state. The strength of India's democracy is in its roots in local organisations, in village councils and district boards. Here, again, we go back to Gandhi, for it was he who introduced the elective principle into Congress. Democracy has thus taken strong root in India, although the large percentage of illiteracy constitutes a weakness

The Emergence from Poverty.—At the date of independence the vast majority of Indians were at starvation level Her economy was not only poor but unequipped for development; her population was increasing by five million a year, and furthermore her chances were damaged by the partition and the consequent strife and uprooting of millions of people The thinking on economic matters of Jawaharlal Nehru, Gandhi's successor, was of course very different from that of Gandhi. The Congress Party of India had taken office in 1936 (under the Government of India Act of 1935) by which time Nehru had established a planning committee Gandhi had thought of India becoming prosperous through village industries but Nehru realised that prosperity could be achieved only through comprehensive economic planning

India and Atomic Energy.—Mr Nehru has said that "absolutely, under no circumstances" will India make atomic weapons But India has been able to develop her atomic energy industry up to weapons standard. She has large supplies of uranium and thorium; and good physicists headed by Dr. Bhabha India is driving straight into the nuclear power age, thus bypassing a number of difficulties in creating other sources of power, namely, comparatively few sources of hydro-electricity, large areas a long way from coalfields, and diminished foreign exchange for buying oil India's first big power reactor should be working by 1965.

Foreign Aid: the Challenge to the West.—The Indian plans have been financed in part by India's supply of foreign exchange and by foreign loans But foreign financing has been unco-ordinated and insufficient. Barbara Ward in her book *India and the West*, a work of great force, asserts that India was running out of her reserves in 1958 before any systematic attempt was made by other countries to meet the crisis India, she says, has been bailed out from crisis to crisis but neither machinery nor policy exists to ensure systematic advance. The Western Powers have not committed themselves to seeing that India's Plans succeed. They have done no more, says Barbara Ward, than "half guarantee that they will not be allowed to fail." But you cannot half-launch an economy any more than you can half-launch an aeroplane. A commitment to success, which was the quality of America's Marshall Plan for the restoration of Europe productive machine, is lacking in the West's approach to India. The West, in Miss Ward's view, has not taken a decision committing itself to aid to the point of success; it has not provided sufficient funds; and it has not created machinery to ensure effective co-operation

Women in the New India.—The new marriage law gave effect to the proclamation of equality of women in the Constitution. It permitted marriage between castes (which had not been permitted by Hindu law and practice), thus striking hard at the caste system The marriage law was unified for the whole of India; it is monogamous and sanctions divorce Daughters have an equal right with sons to inherit Women have attained a new independence and dignity and one of the results has been their participation in political work at all levels. Four women have been Presidents of Congress

Nehru, India's great leader and prime minister, symbolises India's highest aspirations As a disciple of Gandhi he revered him, but his political outlook has been different He is an enlightened liberal working towards a modernised, rational, democratic, secular state enjoying both the benefits of large-scale scientific organisation and the spiritual good of individual liberty Under great strains this way and that he has maintained neutrality in the face of world power blocs and has embodied in his politics characteristics from differing régimes He overtowers everybody in Indian public life and is one of the few great figures on the world stage

India and Pakistan.—The strained relations between these two countries have formed a sorrowful chapter The concrete problems which have recently arisen between the two countries are not, in themselves the cause of the strain but are the result of earlier deterioration of feeling This deterioration was most severe in the year before actual partition, when tension between Hindus and Muslims exploded into communal warfare in Calcutta and in certain provinces including the Punjab This strife had roots which struck deep into history for the Muslims had, between the eleventh and sixteenth centuries, conquered by stages almost the whole of India The Muslims had forestalled the British Westerners in bringing almost the whole of India under a single government Therefore in the territories now in the Indian Union, the Hindus are masters in their own house for the first time since the beginning of the Muslim conquest of India so long ago. The partition of the sub-continent inevitably left large pockets of minorities of Muslims in India and of Hindus in Pakistan The long history of conquest, of difference of religion and culture and the bitterness of partition itself—all this background accentuated problems which would not in themselves have been so difficult to solve. We must recall that Gandhi, Nehru and other Indian leaders did their best to heal communal strife

China.—China will be of increasing importance in the coming decade for the whole world, and there are some cardinal aspects which offer an essential key to understanding It is only in the last fifty years that the people of China have emerged from centuries of exploitation It is very difficult for a Western observer whose history of development has been spread over centuries to realise either the condition of Chinese people well into the present century and the dramatic changes which followed the overthrow of the repressive dynasty in 1911 and the advent of the Republic next year. The new leader, Sun Yet Sen, was a great idealist and humanitarian and until his death in 1925 pitted himself against the age-long combination of landlords, military men, and reactionary scholars He built a network of roads; improved irrigation and the strains of cotton; and he created a modern banking system. Yet for all his achievements Sun failed; or perhaps it is truer to say that Sun's party, the Kuomintang, failed him.

The Failure of the Kuomintang.—Sun had advocated such economic and social reform as would secure an adequate livelihood for the people which would offer a firm base for a democracy. It was essential that a people who had suffered poverty and degradation for so long should have a prospect of real improvement. They were the poorest people on earth, with only about a tenth of their soil cultivated and an average life expectancy of something like 25 years. Foreign powers had made things worse. But Sun's efforts to remedy this critical condition were frustrated by privileged groups. Power passed to the military remnants of the old Imperial army and Sun did not succeed in giving his party teeth for militant action for reform. It was doubtless Sun's aim to enlist the co-operation of the Chinese Communist Party (which had been founded in the north in 1921), but two years after his death his successor General Chiang Kai-shek opened an anti-Communist drive. That decision which drove a wedge between Kuomintang and the Communists was to be of tragic consequence, throughout the period of our survey.

The Position in 1945.—When our period opens Japan had been in occupation of Manchuria for fourteen years and had invaded other parts of China, and for eighteen years the Communists had had to struggle not only with Japan but with open war upon them by Chiang Kai-shek. It was not until 1949 that the Communists gained full control and the Kuomintang forces retreated to the island of Formosa. The new Chinese Government has been recognised by the United Kingdom and by most other countries but not by the United States.

The Emergence of Mao Tse-tung.—Sun's exhortations had been taken to heart not by Chiang Kai-shek but by Mao Tse-tung who made a completely new approach to the peasants. Mao soon realised the unlikelihood of success in trying to gain support in towns. He therefore turned to the peasants, and it was this change of tactic and his success in raising peasant armies which established the pre-eminence of Mao as a leader. For it was the countryside which enabled the Communists to succeed. First, it helped that party to develop honest government—the peasant participants were poor with little opportunity for corruption, the rural areas were free from foreign influence, and they were less vulnerable to conquest than compact urban centres. But there were two other overriding factors. First, it was the peasants who needed the reforms, to secure which they were ready to work in field and forge. Second, it was the peasants who created a people's army superior to all other armies in Chinese history.

Mao.—Mao takes his place as one of the four chief figures of Asia in the last decade—the others being Nehru and Vinoba Bhave of India and U Nu of Burma. He is the son of a farmer of the middle rank and this doubtless endowed him with an insight into the character of peasants. His identification with the Party was complete, whereas Chiang had called for allegiance to himself rather than to a coherent body of principles. In a sense the struggle between the two men was between a party and a person. China apparently needed a party. The portraits of Mao suggest a somewhat elderly, benevolent woman and he is, indeed, sometimes known as Grandma Mao.

Land reform and the Commune.—In 1950 Mao extended to the whole country a land reform previously applied only to certain regions. Land was redistributed so that about sixty per cent of the population, who had hitherto had no land or so little as to be unable to make a living, now had the means of a livelihood. A further development was the integration of a number of mutual aid teams, covering perhaps 20 to 50 farms, in producers' co-operatives. Soon nearly all farms had joined high grade producer co-operatives—much larger concerns than those originally introduced. At that point the commune was established. The commune, an institution of increasing importance in China, linked producer co-operatives into a larger unit but did much more. It absorbed local government and industry in rural areas, village education, public health and communications. At this stage a big effort was made on the social welfare side—the establishment of dining rooms, nurseries, schools and houses. This is the year of "The Leap Forward" when China claimed to have doubled her harvest. China no longer had too many people—she could absorb all her manpower by the new large-scale methods. Writing on China's communes Dr. J. S. Horn, the British surgeon, consultant at the Peking Medical College Hospital, said "Think what it means to be assured of three solid meals a day, where ten years ago the idea of food guaranteed for everyone would have been regarded as Utopian fantasy."

The Second Five Year Plan (1958–62).—China's development was steady between 1949 and 1958, when it became spectacular, and the years 1958 and 1959 are known as the years of the big leap forward. In 1959 and 1960, however, China suffered severe losses from the worst weather conditions for a hundred years with floods, droughts and typhoons. But her Government claimed to have achieved by 1961 the main targets of her second five year plan ending in 1962. Her steel production, 158,000 tons in 1949, rose to 18 million tons in 1960 (compared to 90 millions in the USA and nearly 25 millions in the UK). Great progress has been made over the whole national economy. Priority is now given to heavy industry, but this has been possible because of the prior development of agricultural and light industry, both of which continue to expand rapidly. Unfortunately Britain's share of China's total foreign trade is still only about two per cent.

Women in the new China.—A test of whether progress in a community is real is the position in it of women, and on this test China, like India, comes out remarkably well. In Chinese life the woman had always been regarded as inferior to man and she was conceded no rights whatever. A woman was regarded as eternally a minor—her very children not properly belonging to her. Footbinding expressed the destiny of confinement which men imposed upon women. A man could, whenever he pleased, repudiate his wife, he could sell his wife as a concubine. With all this went slavery and infanticide. Millions of girl babies were drowned or given as fodder to swine. In 1931 the Kuomintang introduced the new Code of the Family by which women could inherit, they were considered as human beings, marriage could not be imposed as a commercial transaction. In actual practice, however, the new law was not effective. So late as 1936 wives and widows were being sold in Peking and Shanghai and the immense majority of the peasants knew nothing of the new rules. In 1937 there were still two million girl slaves. The Communists affirmed in the Marriage Act 1950 the complete equality of the sexes, abolished infanticide, authorised remarriage of widows and based the family upon the equal right of man and woman to self-determination. The Communists concentrated effectively upon the status of women for the benefit not only of women but the whole community.

China and the Great Powers.—The newspaper reader may well have been puzzled by the changes in China's attitude to foreign Powers, including Russia. Since 1949 there have been seven major phases in China's foreign policy.

1. First, in 1950, an alliance with Russia, with a drawing away from the United States.
2. A desire to expand beyond her old boundaries. (The Korean War.)
3. A plan to gain Great Power status by establishing a hegemony over Asian nations.
4. Realisation of the dangers of this plan (Bandung Conference).
5. New relations with Russia.

6. Long-term firmness and patience over Formosa.
7. A disagreement with Russia in 1961

The offensive by China's North Korean protégé against the South, a disquieting sequel to the 1950 Treaty with Russia, was followed by the two-year Korean War, an all-round tragedy, and resulted in intense bitterness between Communist China and the United States China changed her policy and made a strenuous bid to win the friendship of Asian nations by emphasising her peaceful intentions at the Bandung Conference of Asian and African countries in April 1955. By 1954 when Manchuria came under the complete control of the Communists China felt strong enough to assert her independence and at the same time her sense of solidarity with Russia During the last two years however relations with Russia have been strained

The United States and Formosa.—When Chiang Kai-shek had withdrawn his forces to the island of Formosa some hundred miles to the east of the mainland, the United States who had supported Chiang throughout the Civil War undertook to defend the island Peking claimed that Formosa was a domestic issue and that the United States was interfering in the Chinese civil war The tension was heightened by the fact that it was the Nationalist government which was recognised by the United States, although the British government and most other countries recognised the Communist Government Moreover Formosa—with the official title of Taiwan—occupied the seat of China at the United Nations and as such was a permanent member of the Security Council as one of the big Powers Thus for many years and up to the time of writing the six hundred million Chinese of the mainland are excluded from membership of the United Nations The United States and China came near to war in 1954–5 China refrained, however, from trying to capture Formosa, although she secured the Tachen group of islands to the north-west of Formosa; and tension eased until the shelling by Peking of the island of Quemoy in 1958 In the subsequent negotiation the United States declared that she would not use force to reconquer the mainland.

India and China: The Frontier Dispute, 1962.—The unfortunate clash between these two countries about their border came to a head in the autumn of 1962 The Indian Government had taken the view that the 2,500-mile northern frontier drawn up when the British ruled India remained valid whereas that alignment is not recognised by China But the issue did not become a live one until 1959 after China had occupied Tibet Repeated attempts to negotiate an agreed frontier failed. The disputed areas are (1) the northern region of Kashmir called Ladakh, the Ladakhis are Buddhists with intimate ties with Tibet and (2) in the north-east where the border is the so-called McMahon Line This line was drawn on the map by a British official of that name at the time when China was weak and it has never been agreed to by China Here too the inhabitants are more akin in religion, habits, and appearance to the Tibetans than the Indians The area of Ladakh which the Chinese claim links Sinkiang with Western Tibet (both in China). The Chinese Government announced a cease-fire on 19 November to begin on 1 December Both China and India appear to have an arguable case on historical, geographical, and judicial grounds

The Union of South Africa.—Only by a small majority did Marshal Smuts persuade the Union Parliament to join the rest of the Commonwealth in the fighting of the Second World War But not long after the war ended Smuts's party, the United Party, was defeated in a general election and soon afterwards Smuts, who had been a world figure, died. The National Party which came to power, led in turn by Dr Malan, Mr Strydom and Dr. Verwoerd, was determined to maintain the supremacy of the white over the brown and black races in South Africa by a policy of separation known as apartheid (*see* J4) By 1961 the Union of South Africa, founded with such high hopes in 1910, became a republic. Not only that but the country had broken with the Commonwealth on the colour question It severed diplomatic relations with the new African states, was at loggerheads with the United Nations, was threatened by economic boycotts and was rearming at great expense

Albert Luthuli.—The apartheid policy in South Africa threw up its heroes and heroines to keep alive ideas of tolerance We here salute one of them, Albert Luthuli, the Zulu chief who won the Nobel Peace Prize in 1960 He was President of the chief African political organisation, the African National Congress, until it was banned in 1960 after the shootings at Sharpeville "I am in Congress," he said, "precisely because I am a Christian" Luthuli, whose grandfather was one of the first Zulu converts to Christianity, has devoted his life to passive resistance against apartheid and after imprisonment has been banished by the South African Government to an area of Durban He became a world-wide figure during the South African treason trials Luthuli has fired the imagination of young people the world over, and this was illustrated by the remarkable fact that the students of Glasgow University in 1962 elected him Rector of their University Luthuli's autobiography *Let my people go* (1962, Collins) contains some excellent photographs of him

Cuba.—During recent years tension has been mounting between the United States and Cuba, the island in the Caribbean to the south of Florida Cuba, like all the twenty republics of Latin America, was once a European dependence This background accounts generally for its "anti-colonial" attitude So far back as 1823 Mr Monroe, then President of the United States, claimed the right to keep Europe out of the American hemisphere on the ground that the latter kept out of Europe This "hands-off" dictum was part of what is known as the Monroe Doctrine But obviously the events of the world killed the Monroe Doctrine in 1917, when the United States entered the European war, and finally buried it in 1945 The revolution in Cuba led by Dr. Fidel Castro was to have a profound effect throughout Latin America and to transform relations with the United States Castro demonstrated that a small nation could free itself from United States domination and yet survive and he was able to eliminate corruption in the government of a country which has been infamous for it The revolution was both heartening and alarming Castro really did provide new homes and schools and hospitals, and raise the standard of living He expropriated the land and gave it either to peasants or to co-operatives By the end of 1960 the Cuban Government were in control of virtually all the nation's resources—land, industry and commerce, and had freed the economy from United States domination, socialising its whole means of production But in doing so Cuba became a totalitarian state, court-martialling and executing opponents of the régime.

Cuba and the United States.—The United States in 1960 suspended its purchase from Cuba of sugar which is of course a very important cultivation in Cuba The Soviet countries thereupon gave Cuba assurances that they would take the place of the United States as a market for sugar When, later that year, the United States stopped exports to Cuba (excepting certain foods and medical supplies) the Soviet countries said they would supply them with machinery, petroleum and essential raw materials Early in 1961 the United States broke off diplomatic relations In the spring two U S aeroplanes, but manned by Cubans, attacked the principal military bases near Havana, the capital. Two days later 1,500 invaders, Cuban exiles—armed, trained and largely controlled by U S agencies—landed on the island but were driven back to the beaches and overwhelmed. The United States intelligence service had assumed that the Cuban people would

rise against Dr. Castro directly they heard of the landing. After a denial that the United States had any part in the affair President Kennedy accepted responsibility for the U.S. part in the attack. Controversy broke out in the States. Confidence in the new Kennedy administration was shaken. The director of Intelligence (the Central Intelligence Agency) retired. Mr Walter Lippmann, one of the best political commentators, wrote that the affair was fundamentally alien to the American character. Relations between the two countries were more bitter than ever, and, by the end of 1961, Cuba became a communist state in the full sense. Eighty per cent of Cuba's exports were going to the Soviet countries and to China instead of to the United States.

The Cuban Crisis of the Autumn 1962.—The world came very near indeed to war—to the brink of war, to use the metaphor which had for some years become unpleasantly familiar—during the last week of October 1962. Some weeks earlier President Kennedy had pledged the United States to take measures to oppose the creation of offensive military power in Cuba. On October 22, upon alleged evidence of offensive Soviet missile sites there, he announced a blockade of ships (or more precisely a quarantine of ships) carrying weapons to Cuba. Some Soviet ships altered course thus avoiding a direct confrontation. U Thant, then Acting Secretary-General of the United Nations, asked Russia to stop arms shipments and the U.S. to lift its blockade for two or three weeks to enable talks to be held. While agreeing to talks the United States said that, as missile bases were still being built, the blockade would continue. The United States furthermore was clearly contemplating further action if necessary—invasion or bombing of Cuba. Mr Khrushchev then offered to move from Cuba weapons which the United States "regard as offensive" if the Americans removed their missiles from Turkey (whose border marches with U.S.S.R. territory). Next day, five days after the opening of the blockade, Mr Khrushchev decided to dismantle Soviet missile bases in Cuba and ship "offensive weapons" back to the Soviet Union, the United States agreeing to give assurances against an invasion of Cuba. The ordinary man, casting around for the salient points which emerge from this frightening position, may think these to be:

(1) that the psychological dangers of foreign bases everywhere—Turkey and Finland, for example, no less than in Cuba—were made plain,

(2) recognition had been given to Cuba's right to her own régime without suppression by the United States,

(3) the fact that the world was brought to the edge of war without any consultation with Britain, European countries, or the United Nations, and

(4) that the United Nations, urged on by the smaller nations, nevertheless played a great and conciliatory part in averting catastrophe.

France and de Gaulle.—One of the biggest changes in France after the war was the wiping out, as a serious factor, of the Radical Socialist party so powerful before the war. The newspaper reader must not be misled by the titles of foreign political parties—the Radical Socialist party was not radical and it was not socialist giving those terms the meanings they have in England. They never regained their place in the Fourth Republic which spanned the years 1946–58. There was one hopeful spell when Pierre Mendès-France (one of the most courageous premiers France ever had) made a vigorous attempt to reform the party, only to lead to his forming a leftist splinter group of his own. In 1958 General de Gaulle, who had had a brief period of power in 1945–6, established a semi-presidential system with himself as President, taking certain powers away from Parliament and thus opening France's Fifth Republic next year.

The grant of independence to Algeria was a beneficent achievement. His dramatic refusal, however, to vote for Britain's admission to the Common Market; his refusal to accept President Kennedy's offer to share defence arrangements, and his hints of a new foreign policy imparted a novel and enigmatic pattern to the European scene.

De Gaulle: Resistance Leader and President.—After the collapse of France in 1940 de Gaulle, an unknown General, had fled to London and asked Frenchmen everywhere to rally to his standard. Pétain, when the Germans came, headed the French Vichy Government which surrendered and collaborated with them. De Gaulle entered Paris as a conqueror in 1944 and set up a provisional government, which afterwards became the Fourth Republic. He resigned in 1946 because the multiplicity of parties made government unworkable, and stood in the wings, so to speak, living quietly in the country, until he obtained power again in 1958, when an Army revolt in Algeria brought the country near to civil war. After another four years of bitter struggle—a complicated struggle since the Army and the French colonists in Algeria were often in conflict with de Gaulle—involving treasure of life and wealth, a settlement in Algeria was reached in 1962. De Gaulle made great use of the referendum—in 1958 on his Constitution, in 1961 and the following year on Algeria and in October 1962 when he asked for a vote of confidence. This was occasioned by his proposal to abolish the method of selecting future Presidents (hitherto made by an electoral college) and ensure that he could nominate his own successor. This move to weaken parliamentary government and strengthen personal presidential government had resulted in a censure vote by the French Assembly. In this referendum de Gaulle received 61 per cent of votes cast but this was only 45 per cent of registered electors. De Gaulle secured his vote but France clearly dropped a warning that, though she wants a stable government, she is not indifferent to the manipulation of the Constitution, the disregard of Assembly votes, and the one-sided exploitation of television and radio for propaganda. But, soon afterwards, de Gaulle's party was so successful at a general election as to secure a majority in the Assembly and ensure a compliant Assembly to support him.

De Gaulle: the Man.—De Gaulle's formidable height has presented cartoonists the world over with something unusual to play with and they have relished turning the image into every conceivable kind of column, pole or stick. He has created a "mystique" of a complete identity with France. He is aloof, egotistical, courageous, with a pessimistic view of human values which may be the cause of his inaccessibility and aloofness—positively lunar, as one commentator says. In public policy he has encouraged rapprochement with Adenauer but fear of German rearmament has strengthened his determination to have his own atomic weapons, and the French have made three test explosions in the Sahara. Who will take his place? The more time that passes to allow the Algerian settlement to mature the less the likelihood of a *coup d'état* by the discontented Army chiefs which might thus cause civil war.

The Non-aligned Countries.—A large number of countries have obtained independence since the last war. This fact gives them a sense of unity, they all, of course, fear the threat of war which might destroy their independence and would certainly jeopardise their development, and they are all vitally concerned in getting assistance, financial and technical, from the developed countries. But from that point we see the greatest variety. Cuba on the extreme left, Ethiopia, Nepal and Somalia on the far right and the rest shading from one end to the other. A large proportion of the world's nations is therefore outside the two great Power blocs. But when we look at those whose sympathies are neither towards the one nor the other we are unable to find that they are coherent in their outlook or able to take corporate action, although many of them stood together over Suez, the Congo and Cuba. The rise

of the non-aligned countries is a new factor in world politics of the greatest importance as their influence at the United Nations shows

The Western Attitude to Non-alignment.—The West's attitude to these new countries is ambivalent, as theirs is to the West There is a love-hatred relationship towards the countries whose domination they have overthrown—Pakistan having what might be called a love attitude and Guinea a hate attitude Similarly the attitude of the United States is mixed—bad towards the Latin American countries and worst of all towards Cuba The British attitude is at present cautious and sceptical

The Russian Attitude to Non-alignment.—The Russians do not like non-alignment, which carries with it the freedom to decide in international situations But caution is imposed by two factors. If the drive against colonialism were backed by force the danger of nuclear war would be opened. Further, Russia has a fear of impinging too violently upon bourgeois states like India and Egypt though of course she helps them This attitude is temporary for, like the West, she hopes to swing them over sooner or later to her side

The Changing Face of Africa has been one of the most dramatic features of our time. During the two years 1960–1 alone, nineteen new sovereign states appeared Before 1955 there were only four states not controlled by Europeans in Africa —Egypt, Ethiopia, Liberia, and Libya, independence was then reached in ones and twos, but in 1960 came the flood. Now nearly four-fifths of the population live in independent states whereas, before 1955, four-fifths lived under European rule. (*See* **K194–5**) After seven years of fighting France gave up her rule over Algeria in 1962. Britain may be very proud of the part she has played in liberating conquest peoples—totalling in all a population greater than that of the Soviet Union; and this fact must be remembered in the difficult struggles between African nationalists and the hitherto dominant white majorities in the Rhodesias As we have said earlier we must hope that Britain will again show that she is on the side of co-operation with the African peoples in the countries of the Central African Federation A failure to do so may tragically jeopardise what has been achieved elsewhere by undermining the confidence of Africans in moderate leaders.

The Crisis in the United Nations.—We cannot trace here the history of the United Nations since its origin in 1945 It is impossible to imagine what might have befallen the world but for its existence The General Assembly is, in simple truth, the nearest thing ever evolved to a world parliament. It has more than doubled its size, a fact which testifies to its indispensable value Standing as it does at the centre of conflicts it is natural that a good deal of bitter criticism should fall upon it After nearly twenty years of endeavour in every field of life there are three special points which cause concern. First, the organisation is kept short of money. Neither France nor the Soviet Union, for example, has contributed towards the crippling cost of the UN Congo operation, and the chances of getting payments from these and some other countries are slender, despite the advisory opinion of the International Court of Justice. Second, as the membership of the United Nations grows so does the balance of power within it tip towards the representation of non-committed countries, and the United States, particularly, is inclined to think this inimical to American global interests. The Afro-Asians are naturally more deeply concerned to eliminate colonialism and to oppose apartheid than with cold-war issues and the Assembly's condemnatory resolutions on Southern Rhodesia and on South Africa are indications of their challenging attitude. The third cause of crisis is the Russian " troika " proposal, at present in abeyance, for three secretaries instead of one Secretary-General. Thus the United Nations is passing through a most difficult phase We cannot leave the subject without noting that Communist China is still not admitted; that there seems no early prospect of her being admitted, and that the dispute between her and India over their border might have been solved—as many problems between members have been solved—had China not been forced, principally by the influence of the United States, to remain outside the family of nations.

UN and the Emergence of African and Asian States.—The complaint is often made that the emergence of a mass of new Asian and African states has unbalanced the original UN structure. How absurd, it is said, that voting in the Assembly should be equal for the large and the small, for the advanced and the backward. An underlying confusion of thought is cleared up in a readable and valuable Penguin *United Nations Piety Myth and Truth* by Andrew Boyd (1962) He points out that " the new nations " include India, the world's second most populous country, and Indonesia and Pakistan, each with far more inhabitants than any West European country The two UN members with the smallest populations of all are European Iceland and Luxembourg Asia and Africa which contain two-thirds of the human race, command only half the Assembly's vote Latin America, with only one-fifteenth of the world's population, has a fifth of the votes and Western Europe with a tenth of the population has a sixth of the votes. If we gave the United States 120 Assembly votes because of its population, India would require 300 and China (when admitted) 460 votes.

World Government.—The great world issues which we have alluded to—East–West relations, world poverty, relations between rich and poor countries—all demand world solutions. But we have not yet been able to generate any powerful feeling towards the creation of a world government This is a challenge which has not yet been met, and the reader may usefully think of ways and opportunities when more dynamic feeling might be put behind what is at present a distant possibility Meanwhile we may note eight steps which, if they could be adopted, would quicken the pace towards world government·

1 the establishment of a permanent international police force,
2 the setting up of a UN disarmament agency,
3 the creation of a world development organisation;
4 the obligatory payment of UN dues,
5 fullest support for diplomatic activity of the UN Secretary-General;
6. reform of the UN Security Council;
7 the admission of the Chinese People's Republic,
8 acceptance of decisions of the Security Council and recommendations of the General Assembly when carried by an overwhelming majority.

3. THE SCIENTIFIC REVOLUTION

The Space Age.—A persistent bleep sounded the opening of the space age to a startled world on 4 October 1957 It came from the world's first artificial earth satellite, *Sputnik I*, launched without any preliminary heralding by the U S S R. Sir Bernard Lovell, head of the Jodrell Bank Observatory, called it " absolutely stupendous " and " the biggest thing in scientific history " A *Times* leader said, with a straining for understatement, " The achievement is impressive " Within a month *Sputnik II* went into orbit with a " test animal "—the dog Laika—aboard During 1958 the United States launched five earth satellites and two space probes, the Soviet Union going on to the launching of *Sputnik III*. Accuracy in shooting impressed the world when a direct hit on the moon was achieved by Soviet *Lunik II* in September 1959 and a month later *Lunik III* took photographs of the far side of the moon and transmitted them successfully back to

Earth. More United States satellites were launched that year and next year the U S launched satellites for astronomy, meteorology, navigation and communications, the well-known *Telstar* system being developed under the last group In August 1962 the Americans launched their *Mariner II* towards Venus and at the time of writing (14 December 1962) scientists are listening to the music of the spheres as signals from the spacecraft come across 36 million miles of space transmitting information about the planet which will later be analysed Then in November 1962 Russia launched a spacecraft on a seven-month journey towards Mars When, therefore, these lines are read Mars will have yielded some of her secrets and the historic question of whether there is life on the planet may have been settled by the photographs taken. *See also* **Section F, Part IV.**

Manned Space Flight.—The biggest news of the opening years of the space age came on 12 April 1961, with the first manned flight—Yuri Gagarin's orbital flight in the Russian *Vostok I*, to be followed by the first co-ordinated two-manned flights, the two pilots being Nikolayev and Popovich In 1962 Walter Schirra returned to Earth with an accurate splash in the Pacific from an American spacecraft. *See also* **L107.**

The Confusion of Aims in Space.—The early satellites were conceived in the spirit of the International Geophysical Year and scientific in purpose But this purpose has become submerged by national prestige, by international conflict and military security secrecy Soon space will be used for communication, transport, commerce, exploration Those who were hoping that space flight would bring great benefits are now appalled by what may follow from cold war attitudes The situation in space is just as wonderful as it appeared with the bleep of the first *Sputnik* but it is darkened by the menace of the cold war. The cost too is crippling—for the United States it is something like five thousand million dollars a year Critics continue to ask whether, in the scales of science, space weighs too heavily

The Defence Controversy.—In the late 'fifties the subject of Britain's defence became an acute public controversial issue One group takes the view that, by renouncing nuclear weapons and scrapping stocks of atomic and hydrogen bombs and the means of delivering them, by withdrawing from the North Atlantic Treaty Organisation (NATO) and by abolishing American bases, this country will be stronger, not weaker For the argument is that Russia, which has no serious quarrel with this country, would not bother to attack us if we had no nuclear weapons and were freed from association with NATO and the United States Furthermore, say the unilateralists (the name given to those who take this view), such a renunciation would be a lead to other countries contemplating their own atomic weapons—perhaps the most hopeful means of preventing the spread. Among avowed unilateralists are Bertrand Russell, J B Priestley, Commander Sir Stephen King-Hall, and Professor A J P. Taylor. Ever since 1958 increasing numbers of people organised by the Campaign for Nuclear Disarmament have set out every Good Friday from Aldermaston, the site of a nuclear research establishment, to march fifty-five miles to Trafalgar Square, London, for a mass demonstration That march, led by Canon John Collins of St Pauls Cathedral, has become a regular annual event Opinion is of course sharply divided on this subject, but it may be worth quoting here the opinion of the international group of scientists known as the Pugwash Movement (which is described later) that "defence against nuclear attack is very difficult Unfounded faith in defensive measures may even contribute to an outbreak of war" At the end of 1962 the Campaign, accepting that, at least in the near future, there is no chance of persuading Russia and the United States to give up their nuclear weapons, proposed to concentrate its efforts at denuclearising the rest of the world. This implied not only the abandonment of our own deterrent but resistance to the creation of a European deterrent.

The Defence of Defence.—The idea of unilateral disarmament caused no debate within the Conservative and Liberal parties. But it did cause a hot debate within the Labour Party. Many trade unions espoused the unilateralist cause, the leading figure being Frank Cousins of the Transport Workers; and against the strong opposition of Mr Gaitskell and the National Executive they secured the approval of the Labour Party Conference at Scarborough in October 1961 to a demand for unilateral renunciation of the testing, manufacture, stockpiling and basing of all nuclear weapons in Great Britain, although by a small majority It was on this occasion that Mr Gaitskell used the phrase, so often quoted, that he would "fight and fight and fight again to save the Party we love" and secure a reversal of the Scarborough decision He succeeded in this at the Conference in the following year.

The Defence Blues.—The public got some notion of the tremendous cost of modern weapons, which are constantly being scrapped before full development, when in April 1960 the Government announced that they were abandoning *Blue Streak* (an intermediate range ballistic missile) which cost over £100 million for preliminary development and compensation for cancellation *Blue Streak* was usable only from a fixed launching pad and it became clear that, by the time it became operational, it would be totally obsolete But this was only one of many cancellations. *Blue Water*, another weapon, was cancelled—expenditure £25 million *Blue Steel*, a powered bomb designed to help British V-bombers to penetrate Russian defences, came to the fore in 1962, intended to be replaced in 1964 or 1965 by the American *Skybolt* It was therefore literally a bolt from the blue when the Americans announced in December 1962 that they had decided to discontinue further development of *Skybolt* The British Government, therefore, decided to replace the airborne *Skybolts* by the seaborne *Polaris* missiles, intended to be installed in British submarines The switch involves serious technical, financial, and political problems The British Polaris submarines are expected to become operational by 1970 and ultimately merged in a NATO multilateral nuclear force.

Is the Spread of Nuclear Weapons Inevitable?—The layman is naturally prone to suppose that the use of nuclear weapons must spread as surely as the circles ripple outwards from a stone falling in water But we are told by experts that this is not so The motives and the circumstances of countries are mixed Both Canada and India have deplored a domestic nuclear policy, although India's views may be changed by the conflict with China China's indication that she will obtain nuclear power independently has been expressed in very ambiguous terms. Sweden hesitates to complicate the delicate position between her neighbours Finland and Russia Israel shrinks from the prospect of a Middle East full of nuclear weapons Belgium and Italy have both agreed to the supply to them of fuel for atomic power stations being safeguarded against use for military purposes Japan's nuclear supplies are strictly controlled by International bodies Both the Soviet and the United States governments embodied in their disarmament proposals of 1961 a proposal not to relinquish control of nuclear weapons to any nation not owning them or give them any information or material to make them Furthermore the cost of creating a nuclear weapon force is rising

Is the Spread of Nuclear Weapons likely?—Nevertheless the layman will remain apprehensive and it would surprise very few people to hear any day that a fresh Power had acquired nuclear weapons There is, for example, a growing demand for these weapons in Western Germany and General de Gaulle has not left much doubt about

his ambitions for France. The complexities and the chances are discussed in a study written by Leonard Beaton and John Maddox (the defence and the science correspondents of *The Guardian*), *The Spread of Nuclear Weapons* (Chatto & Windus).

Disarmament.—This word has been familiar to everyone for years but it is not possible, by the reading of newspaper reports, to follow what is really happening on this subject. Mr. Philip Noel-Baker who, in 1958, wrote the classic book *The Arms Race* goes further and says, "It is virtually impossible for those concerned with public affairs and for commentators and the press, to follow what has been done" Yet the subject is one of vital importance to every citizen. Mr Philip Noel-Baker has campaigned for world disarmament for thirty years and there can be few men living with a wider experience of this aspect of international affairs Though the problems of disarmament are highly complex and have, moreover, become obscured, Mr Noel-Baker shows that the difficulties are not insurmountable Recounting the past he wrote

> "Two events of overriding importance stand out from the history of the United Nations work on disarmament since 1952. the Russian acceptance of a great part of the West's proposals on 10 May 1955, and the United States suspension of those proposals four months after Russia had accepted them —a suspension for which the United States received the very reluctant, but in the end complete, support of Britain, France and Canada"

An explanation of the proposals which, at the time of writing, hold the field will be found on in **Part II.** We may permit ourselves two generalisations One is Noel-Baker's view that the threat of annihilation does not cease with the banning of nuclear weapons The other comes from Wayland Young (Lord Kennet) who interprets for the ordinary man the intricacies of disarmament in the skilful way Ritchie Calder explains scientific matters "It is reasonable to hope that disarmament should generate its own momentum once it starts, and that the difficulties of starting will prove to have been greater than those of continuing." One can only reflect that a world containing three major nuclear Powers would be less stable than the present world containing two such major Powers, and disarmament even harder to achieve

Pugwash—the Scientists of the World Confer.—The Pugwash movement, which dates from 1957, is a spontaneous movement in which scientists from many nations periodically meet, without direct government control, representing nobody and solely as individuals to consider the rôle of the scientist in contemporary life and to discuss how science can be devoted to constructive purposes and not destructive ones By the nature of their work scientists especially are capable of transcending national barriers and forming, as it were, an international community. It took its immediate origin from a declaration in July 1955 by Bertrand Russell, signed by Albert Einstein and nine other scientists, among whom were seven Nobel Prize Winners. "We have to learn to ask ourselves, not what steps can be taken to give military victory to whatever group we prefer for there are no longer such steps . . . but what steps can be taken to prevent a military contest of which the issue must be disastrous to all parties? . . Shall we choose death because we cannot forget our quarrels? . . We urge the governments of the world to realise, and to acknowledge publicly, that their purposes cannot be furthered by a world war. . . ." Why Pugwash? Because the first conference took place at the little Canadian town of that name in 1957. Pugwash was the native place of the American industrialist, Cyrus Eaton, who having heard the Russell-Einstein appeal, from which we have quoted above, financed the first conference and a great part of subsequent ones. A careful attempt is made to see that scientists of widely divergent political views are invited. A "broad spectrum" of general outlook is central to the whole purpose. Among British participants have been Lord Boyd Orr, Dame Kathleen Lonsdale, Earl Russell, Sir Ben Lockspeiser, Sir George Thomson, and Professor J Rotblat. If an agreement to ban test explosions is reached it will have been made possible by the mutual understanding and common objective approach by scientists of different countries, upon whose agreed data negotiations have been based

What War Would Mean.—The longest public statement from the Pugwash scientists came after their conference in Austria in 1958 and is known as the Vienna declaration They said that if, in a future war, a substantial proportion of the nuclear weapons already manufactured were delivered against urban targets, most centres of civilisation in the belligerent countries would be destroyed and most of their populations killed. This would be true whether the bombs used derived most of their power from fusion reactions (so-called "clean" bombs) or principally from fission reactions (so-called "dirty" bombs) Radioactive fall-out would spread, in varying intensity, over the rest of the earth's surface and many millions of people would die, in non-belligerent as well as belligerent countries, by the acute effects of radiation There would be, further, substantial long-term radiation damage, to human and other organisms everywhere, from leukaemia, bone cancer, and shortening of the lifespan, and from genetic damage affecting the hereditary traits transmitted to the progeny Even a "restricted" war supposing it could be maintained in a restricted way, which is unlikely, would cause widespread destruction.

The Hazards of Bomb Tests.—The Pugwash scientists referred to the extensive investigation by the United Nations scientific committees on the effects of atomic radiation In this case too scientists from many different countries have been able to arrive at a unanimous agreement They concluded that the bomb tests produce a definite hazard and that they will claim a significant number of victims in present and following generations Turning to the incidence of leukaemia and bone-cancer due to the radioactivity from test explosions the committee thought the tests may add significantly to the incidence of these diseases This particular conclusion depended on the assumption that these effects can be produced even by the smallest amount of radiation. This assumption was not shared by all the authorities in the field Pending further study the Pugwash scientists said the uncertainty called for a prudent acceptance of the most pessimistic assumption All unnecessary exposure to radiation is undesirable In a war of course the biological damage would be incomparably larger than from tests, and we come back to the central position that the immediate problem is the elimination of war

International Co-operation in Science.—After years of concern with ways of preventing the misuse of science in the wholesale destruction of mankind, the Pugwash scientists—41 of them from twelve different countries—turned in 1961 to constructive international co-operation in science, because this is a way to create trust between nations and science offers the means for giving all men on earth a satisfactory and worthwhile life They planned co-operation in six spheres: in earth sciences, in space research, in the life sciences, in the physical sciences, in assistance to developing nations and in exchange of scientists and scientific information

The Earth Sciences.—As the work of the International Geophysical Year (1957–8) demonstrated, the earth sciences present an especially fruitful field for international collaboration. No one country is likely to provide sufficient funds to conduct, on its own, the world-wide investigations which are required They proposed a survey of the entire ocean—the ocean bed, the waters of the ocean, and the major biological provinces of the ocean and fertility of the waters. At present

man gets only about one per cent of his food from the sea. The aim of international co-operation is to raise the fishing industry from a hunting to an agricultural technique. The annual crop of fish could be multiplied easily by five and it is quite likely that the oceans can produce ten times more food than at present by an expansion of our knowledge of marine biology. They proposed, further, the drilling of the earth's surface to the mantle (*see* **Mohole, L79**). All this is only a part of the proposals in this field.

Co-operation in Space Research.—The scientists realise that complete co-operation in this field, as in some others, will become possible only when the arms race is ended and national tensions are reduced. But certain advances and certain studies can be made now. Among these is the study of how to prevent the biological and radioactive contamination of extra-terrestrial bodies, co-operation on the instrumental study of the moon, and how to create international world-wide systems of communication by satellite.

Co-operation in the Life Sciences.—Among the many fields of biology those which relate especially to human welfare are well suited for combined effort. The scientists called for a considerable extension of the work of the United Nations on international agricultural training programmes. We have already referred to the tenfold increase which would be possible in our supply of food from the sea if we knew more about marine biology. We need international co-operation (and finance) for advances in regard to cancer, cardio-vascular disease, immunology, infectious diseases, mental health, problems of aging, nutrition, human genetics and others. There are many other urgent needs in the health sciences and the co-ordination of programmes and administration in a world centre of medical research need to be entrusted to the World Health Organisation (WHO) of the United Nations whose funds should be at least trebled. Turning to man's environment and his modification of it we meet the problem of pollution of air and water by our industrial activities and by radioactive substances, and we need to learn how to preserve our plants and animals. The developments in biology in the next century, it has been said, will be as explosive as the growth of the physical sciences in our own, and they offer new opportunities for countries to co-operate.

Co-operation in the Physical Sciences.—In many respects modern physical science has become very big and expensive and the world needs large-scale electronic computers and all the very costly apparatus for high-energy physics, controlled thermonuclear research and the study of very heavy elements. The Pugwash scientists urged the creation of intercontinental scientific laboratories served by an intercontinental computing centre. "It is our belief," they declared, "that the astute location of such a striking epitome of science—the most characteristic theme of our civilisation—could have extraordinarily great significance in improving the tone of the present political situation."

Bertrand Russell.—"The initiative for organising the first international conference of scientists and the credit for starting the Pugwash movement goes to one man, Bertrand Russell." These are the words of Professor J. Rotblat, the Secretary-General of the Pugwash Continuing Committee in his *History of the Pugwash Conferences* (Dawsons of Pall Mall, London, 1962). In a speech in the Lords on 28 November 1945, a few months after the Hiroshima bomb, Earl Russell not only forecast the tremendous destructive power of the H-bomb and the resulting threat to civilisation but suggested that a meeting between Western and Soviet scientists might provide the best entry towards co-operation and international control. In 1954 the menace of nuclear weapons became as great as Russell had predicted. He then broadcast on the British radio a talk called "Man's Peril" which made a tremendous impact on public opinion. Embodying his views in a manifesto he first approached Albert Einstein who signed it two days before his death. The other signatories were mostly Nobel Prize Winners, mainly in physics, this being the subject most directly involved. This manifesto was the starting point of the present world-wide movement which has had such a profound influence. Earl Russell is a supreme example of a distinguished scholar—philosopher, mathematician, and Nobel Prize Winner for Literature—who has devoted himself to a public political issue which he regards as of momentous importance. Russell continues his devotion despite the fact that he is over ninety. (*Pears Cyclopaedia* paid its tribute to Bertrand Russell by awarding him their annual trophy in 1955 for his efforts in the cause of world peace—the outstanding achievement of that year.)

The Two Cultures.—Much discussion was aroused in 1959 and has gone on ever since, by a book with this title by Sir C. P. Snow. Most of the salient points of the book have been taken up in the discussions, still continuing, on the condition of Britain and the kind of world into which we are going. In view of this it is worth while recapitulating these themes. (The full title of the book is *The Two Cultures and the Scientific Revolution* and it is the text of the Rede Lecture given at Cambridge, 1959, and published by the Cambridge University Press.) Snow, who is both a scientist and a novelist, asserted that the intellectual life of the whole of Western society is increasingly becoming split into two groups—the scientists and the literary intellectuals. The groups did not understand each other, their attitudes were different, they had distorted images of each other, and in consequence there was dislike and hostility. This polarity of feeling and thought was sheer loss to the community, and therefore deserves analysis and remedy.

The Scientist and the Non-scientist.—The scientists, who have the future in their bones, said Snow, think the literary intellectuals are lacking in foresight and are unconcerned with their fellow men, while the latter think the scientists are optimistic in a shallow way and unconcerned with man's individual spiritual condition. These are in great part tragic misunderstandings which, so far from becoming resolved, cause a separation between scientist and non-scientist which is much less bridgeable among the young now than it was thirty years ago. This division, prevalent all over the Western world, is sharpest in England because of our fanatical belief in educational specialisation and because we let our social forms harden, whereas in other countries they are less rigid. The consequences are momentous. The attitude of the scientist is not understood, and from that stage there is likely to grow an anti-scientific flavour in the outlook of those with a traditional culture. This affects our education and the whole of our national life. We fail to understand the scientific revolution going on around us.

Science as Key to the Future.—We have failed to learn from the scientists what are the crucial problems of the future, chief among which are the division of the world into rich countries and poor ones, and the rapid growth—the explosion as it is called—of population. And since we insufficiently understand what these problems are we do not prepare for them. Snow said that, roughly, if we compare like with like and put scientists and engineers together we are training at a professional level per head of the population one Englishman to every one and a half Americans and to every two and a half Russians. Someone, he comments crisply, is wrong. He thinks, however, that the Russians have judged pretty near right what kind and number of educated men and women a country needs to come out top in the scientific revolution. In this country we need a much larger supply of first-class professionals for supporting research, design, and development. We need, further, a large fund of men able to do the secondary technical jobs. All this hinges of course upon the politicians, administrators and

the entire community having a sense of what the scientists are talking about.

4. CHANGES AND ISSUES

What has the Enfranchisement of Women achieved?—Fifty years ago Votes for Women had been advocated as a panacea which would solve our evils. In 1919 the Sex Disqualification Removal Act, 1919, had provided that neither sex nor marriage should be a bar to the exercise of any public function or the carrying out of any profession How have things worked out? In 1962 there were only 25 women members in the Commons, and there had been only three Cabinet Ministers, two of whom had been Ministers of Education No woman until 1962 was made a judge There were only 151 women barristers against 3,084 men in the 1951 census; and only five are Q C s although there are a large number of women J.P s. There is a steady increase, after a long struggle, of women doctors, but few women secure the highest posts Relatively there are very few women professors at Oxford and Cambridge. In the Civil Service there are two women Permanent Secretaries and about 9 per cent women in the administrative grade Since Labour took control of the London County Council in 1934 there have been five women chairmen· but outside London the position is very different, there being only three women county council chairmen in 1961. In local government service women are only rarely found above low or middling positions The words of the Sex Disqualification Removal Act, 1919, could not be bolder or more commendable; in practice they may mean nothing or very little. "Women's rights," wrote Queen Victoria, "is a subject which makes the Queen so *furious* that she cannot contain herself" She might have taken the subject more calmly had she foreseen that, even after the battle of principle had been won, men would embark upon another campaign—the battle of practice There is still therefore a long way to go before women enjoy full social and economic equality with men, society still does not accept women on equal terms with men.

Women's Claim to Equal Pay.--After considerable procrastination women secured equal pay in the Civil Service, in teaching and in the administrative staff in local government and the nationalised industries But the British Government still does not implement the International Labour Office Convention on Equal Pay. Only one woman in a hundred in industry, as against 50 men, takes home more than £14 a week The average wage of a woman in industry in Britain is about half that of a man the figures are about £7 a week compared with £15 The tradition of paying less for a job because a woman does it is not only still alive but is being extended into new fields like precision jobs in electronics

The Domestic Revolution.—It is since the last war that the greatest changes have come which have benefited women These have been in the home The fusty, dusty paraphernalia have disappeared. Labour-saving equipment has transformed life New fabrics, easily washed and ironed, if ironing is needed, sensible and simpler clothing; detergents and other cleaning materials, frozen foods and refrigerators—all these have helped to banish drudgery from the home Men have entered the kitchen—as designers of modern installations and also to help the wife, which is now as honourable a task as gardening or household repairs Confiding to a fellow peer as they descended the grand staircase of the Athenaeum an earl, was overheard to say· "It's not the washing up I mind so much—it's making the beds" Geoffrey Gorer, the sociologist, finds that an upper- or middle-class wife gets far more consideration and physical help from her husband than does a women of the working class (whose husband would complain that he is being unmanned, turned into a cissy) This social change has therefore still some way to go. The full effect of this domestic revolution can be seen if one recalls that in Britain a hundred years ago there were one million domestic servants out of a total population of thirty million Notwithstanding the abundance of cheap domestic servants the general position of women was bad; today, notwithstanding the absence of domestic assistance, women have much richer opportunities for creating a good life for their families and themselves Perhaps the most important factor in the emancipation of women has been not the vote or the advance of labour-saving devices but the spread of birth control This has changed life for countless women and their families, although it is still true that the poorest families (and the poorest countries) have most children

Earlier Marriages.—An important change in the 'sixties is that there are more boys reaching adulthood than girls so that the chances of marriage for women will much improve Another change is that girls are attaining physical puberty earlier. Professor Carstairs in the 1962 Reith Lectures said that a hundred years ago it was at 17 and now it is thirteen and a half In keeping with this physiological change, the mean age of marriage has declined during the present century A corollary of this is that women complete their childbearing at an earlier age and, thanks to better physical standards, are then free for activities and work outside the home With their earnings women can contribute to securing benefits for the home and family; and all this offers a basis for a more reciprocal partnership and companionship between parents

Racial and Religious Groups.—Disturbances in districts in England where there were coloured minorities were followed in 1962 by insidious attempts to sow hatred against Jewish groups It was pointed out that this fanning of prejudice was a form of social sickness which seemed to arise when men were suffering from fear of unemployment especially if at the same time, for whatever reason, there was a feeling of political cynicism But to disseminate racial hatred was not only a grave incitement to public disorder but was also a revival of the forces which had enabled Hitler to cause such ruin both before and by the fact of the Second World War Racial and religious hatred is repugnant to the sense of toleration and freedom so deeply inherent in English thought and tradition At this point we reach the dilemma that it is our belief in freedom which allows the freedom of speech and writing which covers activities which we dislike Freedom of speech is not freedom if we shrink from allowing arguments which we think are bad The point which emerges is how far ought the community to allow freedom of speech to those whose policy would deny it? At what point should Parliament limit freedom in order to maintain law and order which are clearly threatened by a doctrine of hatred? *See also* **Free Speech and Public Order, D35-6.**

The Restriction of Immigration.—The Commonwealth Immigrants Act, 1962, by applying restrictions to Commonwealth citizens departs from the traditions of common citizenship and freedom of movement The timing of the Act, after a campaign against immigrants from the West Indies, Africa and Asia, was held by its critics to reflect the victory of prejudice over humanity, especially since its application does not extend to the Irish, the largest single group of immigrants The Archbishop of Canterbury called the Bill "deplorable," when it was debated in the Lords, and said the conscience of the country will be aroused to "a new determination to attack again the conditions which have led to the reversal of one of our country's greatest traditions."

The Controversy about Capital Punishment.—So far back as 1930 a Select Committee appointed by the House of Commons had by a majority recommended that Parliament should abolish the death penalty for an experimental period of five years. But a Bill for that purpose was not introduced until 1933 and got no further than a first

reading. Five years later the Commons carried a motion by 114 votes to 89 providing for a five-year suspension but the Government refused to give effect to the decision In 1948 during a debate on the Criminal Justice Bill the House again, in a free vote, declared itself in favour of suspension for five years. But the Lords threw this particular clause out Next year the Government appointed a Royal Commission but it was prevented from considering abolition itself and was authorised to consider only "whether liability . . to suffer capital punishment for murder should be limited or modified" Another four years went by.

The Royal Commission's Views on the Death Sentence, 1953.—All the recommendations which the Commission made were designed to restrict the use of the death sentence They were prevented as we have explained, by their terms of reference from offering a view on abolition itself But they went as far as they possibly could "There is no clear evidence in any of the figures we have examined," they said, "that the abolition of capital punishment has led to an increase in the homicide rate or that its reintroduction has led to a fall" If the most important recommendations which they were making were to be rejected, the Commission concluded, then the issue is whether capital punishment should be retained or abolished The Government passed a Homicide Act, 1957, which drew a distinction between capital and non-capital murders—an Act which Lady Wootten has recently said is almost universally condemned

Crime.—It is only recently that the attitude to crime has moved into a new stage This might be termed the fourth stage. The first, in the first half of the 19th century was to treat the culprit so harshly that it would (so it was thought) deter others, this was the era when men were hanged for most trivial offences In the second stage some attempt was made to fit the punishment to the crime; and capital punishment was sometimes replaced by transportation In the early 20th century we began to think about the individual himself as well as the crime he committed, differentiated between habitual offenders and young offenders; abolished the treadmill, created the idea of the probationer and the probation service; and introduced Children's Courts, and preventive detention in Borstal institutions But it was not until the last war that we had reliable statistics of crime to tell us whether it was on the increase and throw light on its incidence Increasing research which is now being undertaken brings our attitude to crime to a fourth stage. One form of research is into possible ways of identifying in childhood, traits which would be likely, if unadjusted, to lead to incipient criminality

Crime and Responsibility.—The hope for the future lies in the promotion of the scientific study of the causes of crime and enabling those concerned with framing laws and administering them to keep in touch with advancing knowledge Society also has the duty of creating the conditions likely to favour the growth of a strong sense of responsibility. We persist in keeping the retributive element in criminal law although we do not know, and we cannot agree upon, what part punishment plays in reform What part should retribution, deterrence and reform play in a theory of punishment, since those three aspects clash and are often irreconcilable? Can prison life ever provide the conditions for real moral improvement? Has the idea of punishment been a success? Society needs protection but to carry through sound reform requires a wisdom still to be attained. *See also* **Crime in a Changing Society, D33–4.**

Pilkington on Television.—Acute controversy was aroused in 1962 when the report appeared of the Committee which the Government had set up two years earlier on broadcasting. The Committee attempted to define the purposes of broadcasting, to assess the achievements of existing television services, to define how far these achievements diverged from the purposes of broadcasting and to attempt to isolate the causes of the divergencies The purposes of broadcasting are defined in the B B C Charter and the Television Act but the Committee thought their best method was to examine the programmes themselves They had regard to the effects of television on the character of our society, saying that television does not, and cannot, merely reflect the moral standards of society and that it must affect them either by changing them or reforming them Broadcasters had the obligation to respect the public's right to choose from the widest possible range of subject matter and so to enlarge worthwhile experience This might be called "giving a lead" but it is not the lead, they said, of the autocratic or arrogant On the examination of the evidence the Committee felt that the purposes of television were not being realised. What were the main causes of dissatisfaction?

Dissatisfaction with Television.—The main causes of disquiet were

1 Too often television portrays a world in which the moral standards normally accepted in society are flouted or ignored
2 Television often shows excessive violence
3 There is a lack of balance The range of programmes shown is not sufficiently wide, each of the subjects within this range is not effectively portrayed, and many items are shown only at inconvenient times
4 Television is guilty of triviality, a word examined more closely in the next paragraph.

In general, the Committee exonerated the B.B.C. from any of the charges arising from this dissatisfaction with television but on all four scores they impeached I T.V Commercial television, they said, falls well short of what a good public service of broadcasting should be The Independent Television Authority said the Committee, discounted the influence of the medium and thus rated the responsibility of the broadcaster lower "The Authority seems sometimes to assume that the criticism is levelled at light entertainment rather than at a lack of essential worth in programmes of whatever kind"

What is Triviality?—It is worth looking more closely at this term, used in the fourth of the causes of dissatisfaction set out in the preceding paragraph This term seems applicable to so much besides television programmes that it may be useful to quote the Committee's definition.

> "Triviality resides in the way the subject matter is approached and the manner in which it is presented . In short, there is no such thing as a trivial programme in the abstract One should add, though, that television has created some forms of programme which particularly lend themselves to triviality, which lend themselves to the exploitation of artificial situations or of 'personalities' but have practically no subject matter or body of their own."

The choice with which the Committee was concerned was not, as the popular press was inclined to represent it, between one kind of programme and another, between light entertainment and serious broadcasting, but between good and bad programmes, whatever their kind. There is good and bad variety, and good and bad documentary What the Committee discussed, though this was often obscured in the public discussion of their views, was not the particular genre but the quality within each genre.

The Pilkington Proposals.—The Committee's conclusion was that a major change of function was required in order (1) to vest the reality of power in I T A itself, (2) to remove from programme planning and production the commercial incentive always to aim at maximum audiences and maximum advertising revenue; (3) to apply the incentive of profitability to the production of the best programmes; (4) to promote real competition in programme production between the

programme contractors; and (5) to promote competition in good broadcasting between the B.B.C. and I.T.V. Therefore their major proposals were:

1. The Independent Television Authority should plan the programmes.
2. The Authority should sell advertising time.
3. The programme companies should produce and sell to the Authority programme items for inclusion in the programme planned by the Authority.
4. The Authority, after making provision for reserves, to pay surplus revenue to the Exchequer.

Thus, finding that the Authority's power to control the programme companies was "illusory and negligible," they recommended vesting in I.T.A. the reality of power. They proposed that the B.B.C. should be authorised to provide the next additional television service. To this specific proposal the Government agreed and to their recommendations on a wide range of subjects. But on the main recommendation, the reorganisation of Independent Television, they postponed consideration. The Television Act expires in 1964 and, sooner or later, therefore, Pilkington must be faced.

An Anatomy of Britain.—What is the nature of the strange malaise in Britain's ruling circles? It is easy to sense it but very difficult to analyse. In a book *Anatomy of Britain* by Anthony Sampson, published in 1962, the author offers a good deal of description of the ruling classes thus preparing the way for diagnosis. His general theme is that the traditional ruling classes, coming from the aristocracy, public schools and Oxbridge, continue to dominate and stultify government with their amateurishness, their cliques and their resistance to innovation. Rulers of this old-style are out of touch with the new people and the new forces coming to the fore in science, education and industry.

The Search for the Establishment.—Those who joined in the self-examination naturally tried to find out more precisely how the wheels went round. What were the forces that set the whole complex country moving? Where did the power come from? Who took the real decisions? Who really counted? And were these people different from those who appeared to control the power? From this it was but a short step to the thought that, possibly, there were not secret sources of power so much as concealed sources. Was there in England a group of people or sections of people who controlled the destinies of the English, somewhat like the one hundred families who are said to rule France? This inquiry began to warm up about 1954 when the word "Establishment" came into use. The word has since been widely adopted but in various ways. In its simple meaning it might be taken to mean the British constitution and the institutions which surround and protect the constitution. It was extended to those who stood guard over these institutions—in the City, in the public schools, in the Church, in the B.B.C., and so on.

Our Social Groups.—As we should expect, the close look at itself which England has been taking includes a good look at our social groups. The simplest pattern is that between "gentlemen" and others, as if the country were an extended county cricket ground with amateurs ("gentlemen") going in by one door and professional players ("others") going in by another as was the case before 1963 when the distinction was swept aside. But we have long thought of at least three main classes—upper, middle and lower. In a stimulating book by various writers called *The Establishment* published (by Anthony Blond) in 1959, Hugh Thomas describes eight English groups, which should not be listed in any ranking order. They are (1) the tenant and yeoman farmers; (2) the agricultural labourers; (3) the surviving members of landed aristocracy or gentry; (4) the intellectuals (defined as those who have taken their education seriously and to be found in teaching, the professions, the Civil Service and the arts); (5) the petty bourgeoisie (small business men and shopkeepers), (6) the capitalists (industrial managers and financial administrators); (7) heavy industrial workers, the largest single group; and (8) the light industrial workers manning modern-type machines, mainly in the South of England.

Lack of a Sense of National Unity.—The need for a common understanding as a basis for moving forward, was emphasised in a series of discussions broadcast by the B.B.C. in 1962 under the title "What is wrong with Britain?" What was lacking, it was asserted, was a sense of a national pattern and this lack had many causes. It was asserted that there was stagnation in many fields—not only in economic growth but in the public services, in industry, in the political parties, and even in sport. A sense of national unity was weakened by an educational and social system which divided the country into classes. Ten per cent or less of the people get one kind of education and the rest get other sorts of education, socially inferior if not otherwise necessarily inferior. This blocked communication between sections and spread a profound feeling of inferiority and superiority inimical to a true understanding of the diversity and virility of our society. Further, our education turned away from a real concern with present social and technical realities, and this led to a persistence of the attitude of mind which had a strong hostility to expertise and technocracy. This attitude was seen as related to the paralysis of will, the refusal to grapple with problems and find new solutions.

Stifling of Initiative.—One of the views in the B.B.C. discussion was that a large mass of the population have their horizons permanently lowered at the age of eleven. Grammar schools largely follow the pattern of traditional education; and these allow a certain section of the lower classes to be mobile. The seventy per cent or so who go to secondary modern schools are given an education intended to fit them for what they are going to do, such as manual work. Initiative, it is said, is stifled and certain kinds of talent, like craftsmanship, are overlooked. The children from these schools are fitted to a subordinate rôle in society, and this ties in with the question of industrial relations where there is a lack of participation on the shop floor. Not only production but the general atmosphere of society are affected in ways easily imagined, if a large section are made to feel that they are not fit for anything much better than a fairly lowly industrial job and that they are not going to go much further.

The Wastage of Ability.—Professor Carstairs in the Reith Lectures of 1962 drew attention to the enormous fund of ability running to waste, stemming from the continuing inequality of educational opportunity. In Britain today 75 per cent of children finish their full-time education at the age of fifteen. For those who go on to sixth forms there is a further wastage—cruel to the student, damaging to the community—since only a small percentage can get into universities. We need a massive expansion in higher education.

A Key to the Pattern.—Each of us will have our own test by which we judge events. The writer finds that he relies upon two criteria to help him when looking at the complex stream. One relates to the point in the preceding paragraph—the wastage of ability—and can be framed in the following question. How far is a political act creative? Will it use potential ability and resources for more abundance and happiness? Will it generate goodwill and growth, human and material? Linked with this is the second question. How far does a political act enlarge the scope of co-operation, create a wider circle of harmony? Our alliances, our blocs, our regional pacts may be judged by whether they lead to a firm and wider harmony or partnership, which we must build or perish.

II. A CITIZEN'S GUIDE

This part comprises an outline—with an explanation of some current problems—of local and central government, our Courts of Justice, the British Commonwealth; the United Nations, Western European organisations, the constitutional and political implications of the Common Market, and some changes in Africa. At the end is a list of voluntary societies of particular interest to the citizen.

A GUIDE TO LOCAL GOVERNMENT.

What is Local Government?—Local Government is concerned with the domestic duties of a community as distinct from national questions like defence or taxes which must be decided by Central Government. Beyond Central Government innumerable tasks remain for the elected Local Authorities.

What Local Government is there in a Village?—Three bodies share the Local Government in a village:—

(1) A Parish Council of between five and fifteen members is elected in all rural parishes where the population is over 300. A Parish Meeting is an assembly of all the Local Government electors of the parish, and it meets every March. Where there are more than 200 electors they may set up a Parish Council, if there are more than 300, they must do so. Where there is no Parish Council the Parish Meeting assembles twice a year.

(2) Second, there is the *Rural District Council* taking in its area a group of adjacent parishes.

(3) Third, there is the *County Council*. The Parish Council deals with the purely local matters we have described. The Rural District Council takes the medium-sized problems like housing and housing conditions and sanitary services. The County Council takes the major services, like education, police, roads.

The Local Government in a Small Town.—Here Local Government is shared by two authorities, the Urban District Council and the County Council, the major services going to the County authority.

The Local Government in a Medium-sized Town.—Here, too, we find only two authorities, the Borough Council and the County Council. The Borough Council is very similar to the Urban District Council mentioned in the preceding paragraph, but the chairman of the Borough Council is a Mayor. Not all areas looked after by an Urban District Council are small. There are five with a population of over 100,000. On the other hand, not all areas with a Borough Council are medium sized, many of them having less than 5,000. A town becomes a borough by obtaining a Royal Charter, and the borough becomes a corporate body with a Mayor, Aldermen, and Burgesses (or Citizens).

The Local Government in a Large-sized Town.—In the largest towns there is only one body. The County Council plays no part, and the Local Authority is the County Borough Council. Thus Leicester is a County Borough independent of the Leicestershire County Council. Certain towns have retained their status because of their historic standing, examples being Oxford and Canterbury.

The Administrative County.—In England and Wales sixty-two administrative counties, covered by County Councils, have been created. The number exceeds the number of geographical counties because the division for Local Government purposes has been made on grounds of convenience.

Local Authorities in Scotland.—These consist of County Councils, Burgh Councils, and District Councils. The County Councils have powers and duties similar to those in England and Wales. Burgh Councils are of three kinds (Royal, Parliamentary, and Police Burghs). The Royal Burghs (holding rights directly from the Crown) and Parliamentary Burghs (created by the Reform Act, 1832) correspond generally to County Boroughs in England and Wales, but they are not entirely independent of the County Councils. The Police Burghs correspond generally to the Urban Districts and Non-county Boroughs in England. The town councils of Burghs consist of Provost, Bailies, and Councillors, corresponding to the Mayor, Aldermen, and Councillors of English Councils. The District Councils broadly correspond to English Rural District Councils. Central control of Scottish Local Authorities is exercised by the Secretary of State for Scotland, the Department of Health for Scotland, the Scottish Education Department, and other Scottish Departments.

Local Authorities in Northern Ireland.—These comprise six Administrative Counties (Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone), two County Boroughs (Belfast and Londonderry), and a number of Borough, Urban, and Rural Districts.

Who Run Local Government?—We have seen that, excluding the area of the London County Council, there are seven different types of local authority.—

Parish Meeting
Parish Council.
Rural District.
Urban District.
Borough
County Borough
County.

Except for the first they consist of representatives elected by the citizens, who ultimately control them. The whole of the members of a Parish Council retire every third year. But in Rural and Urban District Councils and Borough Councils it is the normal practice for one-third of the councillors to retire each year and some continuity of experience is thus assured.

Besides Councillors there is another group of members called Aldermen in Borough Councils, County Borough Councils, and County Councils. They are elected, not by the public but by the Council itself, forming a fixed percentage of the total membership of the Council.

How does Local Government Get its Powers?—A Local Authority may do only those things which it has been empowered to do by Act of Parliament. There are three kinds of such Acts: General, Adoptive, and Local Acts. A General Act may require a Local Authority to do something, or it may permit it to do something if the authority so wishes. Thus Parliament having decided that the minimum school-leaving age is to be fifteen, Local Authorities must see that that rule is carried out: they cannot choose some other school-leaving age. Sometimes the Act lays a duty on the public and requires the Local Authority to see that it is carried out, examples being the Shop Acts fixing hours of shopkeepers.

An Adoptive Act is one which confers power to do something if the Local Authority wish to adopt the provisions of the Act, an example being the Public Libraries Act.

Where does the Money come from?—The services provided by Local Authorities in England

and Wales will cost £1,041 million in 1963–4 and £1,093 million in 1964–5 and general grants by the Government will be £562 and £598 million, respectively, a year, and the main resources are rates and government grants It had been the practice for the larger part of the Government's share to be paid in the form of specific grants, most of which are calculated on a percentage basis The Government in 1958 consolidated twelve of the percentage grants into a general or block grant.

How does Central Government Supervise Local Government?—Local Authorities, in providing services (for example, a Police Force) required by Act of Parliament, are in effect carrying out local administration of a national service. Therefore a Government Department is held responsible for seeing that the Local Authorities carry out their local duties As regards police, the department is the Home Office, for education, the Ministry of Education; for town and country planning, the Ministry of Housing and Local Government. The Ministry of Housing and Local Government has a general concern for Local Government as a whole.

Further examples are the removal of responsibility for trunk roads from local highway authorities and the ownership of civil airfields Other services which have been transferred from Local Authorities are gas, electricity, valuations for rating, and poor relief

a whole and will consist of 100 councillors and up to 16 aldermen. The new boroughs and the Greater London area come into being as official territorial areas when the Bill becomes law, the new councils will come into existence as local authorities when they are elected in the spring of 1964, and from that date until 1 April 1965 the new authorities and the old will continue side by side Thus the new councils will take over their full functions in April 1965 when the present authorities cease to exist

Elections for the Greater London Council.—At the first election of the GLC each borough will form a complete area returning two, three, or four Greater London councillors For later elections, however, each borough will be divided into electoral areas, each with a single member These electoral areas will coincide as far as possible with parliamentary constituencies, which are being reviewed by the Parliamentary Boundary Commission to ensure that they do not span across different boroughs.

The Special Position of Education in Greater London.—The arrangements for education mark an important departure from the Government's original plan Whereas outside the present LCC area education will be a borough function, education inside the LCC area will be the responsibility

Local Government in England and Wales

Parliament

- 1st Tier: County Councils
  - 2nd Tier: Non-County Borough Councils
  - 2nd Tier: Urban District Councils
  - 2nd Tier: Rural District Councils
    - 3rd Tier: Parish Councils
    - 3rd Tier: Parish Meetings
- 1st Tier: County Borough Councils
- 1st Tier: London County Council
  - 2nd Tier: Corporation of the City of London
  - 2nd Tier: Metropolitan Borough Councils

The New London Government.—The Government's plan for a new system of local government for Greater London was published in 1961 and their Local Government Bill for creating the new system was introduced in 1962 The Government's proposals are based on the recommendations made in 1960 by the Royal Commission on Local Government in Greater London, the proposals as they finally emerged containing two important departures which are noted below The new system will involve the abolition of the London County Council and the Middlesex County Council and parts of Essex, Surrey, Kent, and Hertfordshire will have been incorporated in Greater London, which will cover the whole of the continuously developed area within the green belt The system will come fully into effect on 1 April 1965.

The London Boroughs.—There will be 32 new London boroughs and the population of each will be between 170,000 and 340,000 This is a departure from the original proposals of the Royal Commission which conceived smaller units of between 100,000 and 250,000 population Broadly speaking the new boroughs will be responsible for all the important personal services such as housing, health, and welfare Each council will have a maximum of 60 directly elected councillors, plus aldermen up to one-sixth, making a maximum of 70. The councillors will also retire together every three years.

The Greater London Council, a directly elected body, will carry out functions which need to be planned and administered over Greater London as

of a special committee of the Greater London Council The Greater London Council as such will not be the responsible education authority Instead those members elected from the central area alone will form the Inner London Education Authority and from this an Inner London Education Committee will be set up in the normal way The ILEA will decide how much money is needed for education and call for it from the Inner London boroughs The ILEA will not only consist of the GLC members for the Inner London area but also one representative appointed by each Inner London borough and representatives of teachers and churches will be co-opted in the usual way. Freedom of choice will be preserved of schools and colleges not only within the Inner London area but in the Greater London area as a whole. Boundary divisions will not prevent a pupil or student from being admitted to a school or college in another area. The Minister of Education will review these temporary arrangements in 1970

The Powers of Boroughs.—Each borough will be a housing authority although the Greater London Authority will become the "overspill" authority. Local development plans will be drawn up by the boroughs (within the framework of the overall development plan of the GLC) and the boroughs will be responsible for dealing with applications for planning permission. They will be wholly responsible for a wide range of personal health services and welfare services for the elderly, the sick and the handicapped, and children's services.

Highways and Traffic.—The GLC will be the traffic authority for the whole of Greater London.

Thus "metropolitan roads" will come under the GLC and the new boroughs will take the remaining roads except trunk roads which the Ministry of Transport will continue to look after

Other Functions.—The GLC will be responsible for fire and ambulance services, for refuse disposal and main sewerage and will take over the LCC parks and open spaces, and places like the Festival Hall and Kenwood House

The Local Government Act 1958 made the following provisions.—

1. Replacement by a general grant of a number of separate grants made for specific services. The largest to be absorbed are those for education, health, fire, and child care
2. Rerating of industry from 25 per cent of net annual value to 50 per cent.
3. Creation of two Commissions, one for England and one for Wales, to review the areas of counties and county boroughs, and to consider claims for extensions and also claims by large non-county boroughs or urban districts that they ought to be county boroughs. (A population of 100,000 will be regarded as establishing a presumption of adequate size.)
4. Selection of five big provincial conurbations (in England) for special review by the Commission.
5. Reviews of districts and parishes, outside these five areas, by county councils.
6. Delegation of certain health, welfare, and education functions by county councils to the larger district councils

Reviews of Local Government Areas.—In the White Paper on the Areas and Status of Local Authorities the Government stated that there was "no convincing case for radically reshaping the existing form of local government." What was needed was overhaul and improvements to bring it up to date.

County Borough.—At present an essential qualification by a borough seeking promotion to county borough status is that the population of the borough must be at least 75,000 The new Act raised that minimum qualification to 100,000 with certain qualifications

Special Review Area.—The five "special review areas" which under the 1958 Act are each to be examined as a unit are: West Midlands, Merseyside, West Yorkshire, Tyneside, and South-East Lancashire.

The First Areas to be Reviewed.—The first areas to be reviewed, commencing in March 1959, were the East and West Midlands, and this included the West Midlands Special Review Area By 1963 the Commission had issued a Final Report on these three Midland areas and had issued Draft Reports for five areas:

South West general area
Yorkshire and N. Midlands general area
N E general area
Tyneside special area
West Yorkshire special area

and they had under active consideration (1) the Lincolnshire and E Anglia general area, and (2) the area of the North West which includes two special areas (Merseyside and South East Lancashire) and the N W general area.

OUTLINE OF CENTRAL GOVERNMENT.

What is Democracy?—Democracy is a form of Government in which the supreme powers of Government are vested in the whole body of citizens. It thus differs from an autocracy, in which these powers are vested in one person, from an oligarchy (powers vested in a few people), and from an aristocracy (powers vested in a privileged class). This country, the United States, the Scandinavian countries, and most of the Dominions are among the examples of a democracy The classification of Governments into monarchy (a form of government with a King or Queen at the head) and republic (which has no King or Queen but a President) cuts across the division of Governments into those which are democratic and those which are not. For example, the United States is a democracy, but not a monarchy. In this Guide we try to explain how democracy works in Great Britain; the essential methods whereby the people control the Government; and the way Government itself works (including Parliament, the Civil Service, Local Government, and the Judiciary)

Essentials of Democracy.—The fundamental way in which the mass of citizens control the Government is a combination of methods, namely universal suffrage, the rule of the majority, and the right to oppose the Government. Under the first of these three principles all citizens, male or female, over the age of twenty-one have the right to elect their own member of Parliament and to vote in local elections Although we may sometimes take universal suffrage for granted, it came only in 1928, and is the culmination of slow growth. Under the second principle the majority has the right to rule, subject to the safeguards we shall describe later and subject especially—and this is the third principle—to the right of the minority to oppose This consideration is vital to a democracy and opposition is so essentially a part of the British Constitution that the Leader of the Opposition is paid a salary by the Government. The idea of opposition entails the existence of parties, dealt with later.

What is the British Constitution?—The statement that our Constitution is an unwritten one means that there is no single document called a Constitution In this respect this country is unique. Democracy is preserved by the ordinary law, by the political organisation of the people, by custom, and by rights which depend upon the capacity of the people to preserve them

Government of the People.—The supreme law-making body is Parliament (a word which originally meant a talk). Parliament has grown from the original principle that in important matters such as making the laws the monarch ought not to act without counsel and consent, and it now consists of two Houses, the House of Lords, composed of lords spiritual and temporal, and the House of Commons representing the commoners.

House of Commons.—The principal share of parliamentary business is conducted in the Commons Its business is divided into three branches: legislative, financial, and critical.

Composition of the House of Commons.—Its members consist of 630 citizens of the United Kingdom and Northern Ireland, who receive a salary. Women are eligible for membership. Adult citizens of both sexes have the right to vote at general elections subject to certain qualifications. The Speaker or chairman is elected by a free vote of the House from among the members. As Speaker he presides over debates with impartiality and safeguards the rights of members. He is the link between the House and the Crown. The life of a Parliament is limited to five years, although, on the advice of the Prime Minister, the Queen may dissolve Parliament and issue a proclamation calling for election of a new Parliament. Parliament is adjourned from day to day while in session. At the end of the session it is prorogued. At the expiry of its life it is dissolved.

Legislation.—Legislation is the work of making laws. The law of this country consists of common law, statute law, and equity. One may describe the common law as that based on custom and usage as declared and expounded by judges. Statute law is the law made by Parliament,

enshrined in Acts of Parliament or statutes of the realm. Parliament is thus concerned with the making of statute law. The classification of law is explained in another part of this section and in the Section **The Law of England**.

How Laws are Made.—Any member of the House of Commons may present a Bill after giving formal notice, but the principal Bills are those introduced by the Government based upon its programme as outlined in the Queen's Speech The Bill has to pass three Readings before it is agreed by the Commons. The First Reading is a formality. The House gets down to discussion at the Second Reading, when general principles as distinct from details are discussed If these principles are approved, the Bill passes its Second Reading and is then referred to a Committee. This Committee is a Committee of the whole House, with the Chairman of Committees presiding in place of the Speaker (a proceeding adopted for the more important Bills) or it may be a Committee composed of a lesser number of members divided between the parties on relative strength in the House itself Finance Bills and other money Bills go to a committee of the whole House. In Committee the Bill is examined clause by clause. After the committee stage follows the report stage. The House (with the Speaker) considers the Bill as reported to it by the Committee and considers whether further changes should be made. Where the House reports to itself this stage is a formality. The final stage in the Commons is the Third Reading (when only verbal alterations are allowed) and the House considers the Bill as a whole and whether it should or should not become law The Bill, having passed through all its stages in the House of Commons, is sent to the Lords, who may reject or amend it. The Lords cannot require the Commons to agree to amendments, nor can they delay a Bill indefinitely. They have no power in respect of money bills or bills dealing with the duration of Parliament, and since the passing of the Parliament Act, 1949, any other Bill which has been passed by the House of Commons in two successive sessions may be presented for Royal Assent without the consent of the Lords, provided that a year has elapsed between the date of the Second Reading of the Bill in the Commons and the date on which it is finally passed in that House

Money Functions of the Commons.—We return to the Commons and its second function (and one of its earliest in history) to provide the State with money. The Government cannot raise money by taxation (or in any other way) or spend money without the authority of Parliament, and this power of authority belongs exclusively to the Commons. The House can vote money only on the demand and on the responsibility of a minister of the Crown.

Critical Functions of the Commons.—Parliament itself does not govern. The Queen's ministers are responsible for government and parliamentary government means that Parliament ensures that those ministers represent and have the confidence of the party which possesses a majority in the House, and further, that it controls the action of ministers by questions and criticisms. Any member may propose a motion of condemnation of any member or department of the Government, and such a motion would become a vote of want of confidence if it were made by the leader of the opposition

The House of Lords is the oldest second chamber in the world and the most hereditary in its character. The Lord High Chancellor presides. The House of Lords has two sets of functions, legislative and judicial. It is a party to legislation within the limits imposed by the Parliament Acts of 1911 and 1949, and these limits are explained above They are based on the fundamental principle that the function of the Lords, which is a non-representative assembly, is not to thwart the will of the people, but to ensure that that will is precisely and reasonably interpreted. The judicial functions of the House of Lords sprang from the fact that it is the highest Court of Appeal for the United Kingdom. Only the nine Law Lords and those peers who have held judicial appointments hear these appeals, which are presided over by the Lord Chancellor These decisions are final and become part of Common Law. Proposals for reform of the House of Lords are discussed in a later paragraph.

The Queen.—We have seen that the Central Government is vested in the High Court of Parliament or The Queen in Parliament, consisting of the Queen and the two Houses. The Queen's tenure of the Crown holds for life (unless she abdicates), it is hereditary, and it is held by statutory right The Queen is a constitutional monarch, she takes an oath at her Coronation to rule according to the laws and customs of the people. She is the link binding the United Kingdom with the independent countries of the Commonwealth (where she is represented by a resident Governor-General). The Queen is the fount of honour and justice in the realm. She is head of the Forces, which are governed by "Queen's Regulations" She is also head of the Executive, that is all the work of the State is enacted in the name and under the authority of the Crown Her assent is necessary before a Bill becomes an Act of Parliament.

The Parties.—We have said that the right of a minority to oppose is an essential of democracy, and this idea means that political parties are allowed to function The party system implies a government party (which has the largest number of candidates) and an opposition known as Her Majesty's Opposition (the leader of which receives a salary) The party system emerged in the latter half of the seventeenth century as Parliament gained the right to be the law-making body The original division was between Tories and Whigs, the former representing broadly country interests and emerging from the Cavaliers and the latter broadly representing new interests and having their origin in the Roundheads. Thus of the three main political parties today, we may say that the Conservative Party's line of growth is from Cavalier to Tory, to Unionist and to Conservative, the Liberal Party's growth is from Roundhead to Whig and now Liberal, while the Labour Party is the youngest of the three The Conservative Party advocates private ownership of land and the means of life and is inclined to take a cautious attitude to reform. The Liberal Party strongly advocates free trade and also supports private enterprise, but initiates and supports reform The Labour Party distrusts exclusive reliance upon private enterprise and looks to State action or nationalisation to bring about a better distribution of wealth.

The Executive.—We must now turn from law-making by Parliament to the carrying out of the law. The work of applying the law and securing obedience is called the executive work of the Government The Executive comprises five bodies, the Queen, the Privy Council, the Cabinet, the Government Departments or Departments of State and the Civil Service. The Queen as the Head of the State is the nominal head of the executive

The Cabinet was originally a committee of the Privy Council. It consists of the principal Ministers of the Crown, and is responsible for deciding the policy of the Government on all matters affecting the country, whether on foreign or home affairs It has also complete control of the Government Departments. It is thus the central link in the whole machine of government The Cabinet is responsible for the individual actions of its members. This follows from the requirement that a Minister's policy must be in agreement with Cabinet policy. Thus the Government have a common policy and act as one man. This is the meaning of the phrase "Ministerial responsibility."

The Prime Minister.—The office of Prime Minister, like the existence of the Cabinet, was not formally mentioned in law until recent times. He is the link between Cabinet and Queen. It is he

who decides when to advise the Queen to dissolve Parliament. He is leader of the Government party in the House of Commons and gives a lead on policy. A recent writer has pointed out how the Constitution has, after long evolution, divided the functions of leadership and vested them in two personages—a Prime Minister who is temporary and removable by the will of the electorate, and the Queen, who, by contrast, embodies the principle of continuity. In recent years the office of Prime Minister has steadily increased in importance, and the holder bears a growing resemblance to the President of the United States.

The Government Departments.—The Departments are divided into six groups, the Defence Services, the Taxing Departments, the Social Services, the Post Office, Productive Departments, and others.

Changes in the Scope of Government.—During the present century the field in which the Government operates has widened considerably. Fifty years ago the Government was concerned mainly with the maintenance of order, external defence, and foreign relations. Now it is directly concerned in economic affairs, participating in industry and commerce, organising development and investment, and promoting scientific research. A good deal of the State's activities is conducted through public corporations. The increasing impact of science has been reflected in the organisation and promotion of research by the Government. The much wider sphere of Government activity has resulted in there being six times more non-industrial Civil Servants than in 1914, and three times more than in 1935. These figures exclude the Post Office.

Election Results from 1900 to 1959 have been:—

	Cons & supporters	Lib	Lab.	Irish	Others

The Surrender of Peerage: the Wedgwood Benn Case.—In 1962 proposals for the renunciation of peerages were made by a Parliamentary Joint Committee on House of Lords reform. This Committee was set up after a series of events involving Mr Antony Wedgwood Benn, M.P., who declined to accept his seat in the House of Lords upon the death of his father, Viscount Stansgate, whose peerage he inherited but did not want. As a peer he was no longer entitled to sit in the Commons and he was precluded from doing so although re-elected at the by-election consequent upon the vacancy. His re-election to Parliament was declared by the Courts to be invalid and his opponent, who had been decisively defeated, took the seat. The appointment of the Committee issued from this series of novel and anomalous events, and they made a number of proposals.

The Proposals on Lords Reform.—The Committee proposed that:—

(*a*) a person who may succeed to a peerage should be enabled to surrender his peerage,
(*b*) this should apply to those who may have succeeded to a peerage before the time that any change in the law becomes operative,
(*c*) peerages may be surrendered for life only, leaving to the next heir the decision whether to surrender the peerage in his turn,
(*d*) a peer who surrenders his peerage should be enabled to vote at parliamentary elections and be eligible for election to the House of Commons.

These were the main items in a series of detailed proposals which also recommended that:—

(1) a peer who had surrendered his peerage could, if the public interest so required, be appointed a Life Peer under the Life Peerages Act, 1958,
(2) no further peerages in Scotland be created and all peers of Scotland be admitted to the House of Lords on the same terms as peers of England, Great Britain, and the U.K.,
(3) peers of Ireland should be eligible for election to the Commons,
(4) peeresses in their own right should be admitted to the House of Lords.

The Effect of the Proposed Reforms would be to remove an anachronism—the exclusion from Commons candidature of someone who wants to be politically active. The main business of Parliament is carried out in the Commons not the Lords. At present members of the Lords are excluded from reaching the highest offices, and it is clearly inequitable that, by chance of birth, a man should be excluded from becoming Prime Minister, or, on the other hand, given automatically a specially privileged place in Parliament. We shall have to wait for the latter, more extensive reform, but if the proposals for the surrender of peerage are adopted it must bring nearer the day of more fundamental reform of the Lords. That body is very far indeed from being representative of the

Party	1950 (*Electorate* 34,269,764)		1951 (*Electorate* 34,622,591)		1955 (*Electorate* 34,855,907)		1959 (*Electorate* 35,388,029)

educated and progressive elements in the community.

The Life Peerages Act, 1958 was the first attempt to fulfil the promise of reform contained in the preamble of the Parliament Act, 1911. The Act provided for the creation of life peers and the introduction of women into the Lords. The first list of life peers in July 1958 comprised four baronesses—the first women members of the House of Lords—and ten barons.

The Ordinary Man faces the Official: the Ombudsman.—When the ordinary person is injured by unsound administration he has redress but this is limited. Sometimes there is a tribunal to which he can appeal—for example appeals on

pensions, national assistance, planning inquiries, farming subsidies; and since 1959 there has been a Council on Tribunals to watch these tribunals Or the injured person may be able to get his Member of Parliament to take up his case and perhaps ask a question in Parliament. But a question naturally tends to make a Minister defend his department rigidly; and a question cannot, in any event, deal adequately with a complex case. Sometimes the press can help to secure remedy of an injustice. The idea of a commissioner to investigate complaints has been discussed in recent years in this country The idea originated in Sweden where there has been an Ombudsman, as he is called, for more than 150 years. Denmark has had one for seven years and Norway appointed one in 1961 New Zealand is taking steps to appoint a Parliamentary Commissioner of Investigations.

Report by " Justice " on the Ombudsman.—In 1961 the all-party organisation of lawyers called " Justice " issued their report on how an Ombudsman could be instituted in Britain (*The Citizen and the Administration* published by Stevens & Sons, 10*s* 6*d*) It recommends the creation of a permanent Office of Parliamentary Commissioner, with the same status as the Comptroller and Auditor General. His duty would be to receive and investigate complaints of maladministration against Government Departments. He would be appointed for life and would be answerable only to Parliament He would have access to files and would report his findings to a Select Committee of Parliament Like the reports of the Auditor General any criticisms would be confined to the department and would not mention civil servants by name

LAW AND THE COURTS.

The subject of English law and its sources (comprising Common Law, Case Law, Equity, and Statute Law) is dealt with in the Section **The Law of England.**

The System of English Courts.

I. Criminal Courts.—1. *Courts of Petty Sessions* —At the bottom of the ladder are the Courts of Petty Sessions, which can try minor offences punishable either by fine or imprisonment, with a maximum of six months' imprisonment for one offence and twelve months for two or more These courts are presided over by not fewer than two local Magistrates, called Justices of the Peace, whose office is honorary, and who are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County. Some officials, *e g.*, Mayors during their term of office, are J.P.s *ex officio* Most J P s are laymen, but all Petty-Sessional Courts are assisted by a trained magistrate's clerk, who is usually a solicitor.

These courts also act as courts of preliminary inquiry to determine whether there is a *prima facie* case (*i.e* , a case that requires to be answered) against an accused which will require his being " indicted " for trial by jury. This they do by taking depositions from witnesses. If they decide that there is no *prima facie* case, the accused is discharged, if that there is such a case, he is committed for trial either to the Quarter Sessions or the Assizes. In many of the bigger towns a barrister known as a " Stipendiary Magistrate " is appointed to act as sole and permanent magistrate, and in London there are a number of such magistrates known as Metropolitan Police Magistrates.

2. *Quarter Sessions.*—These courts have a wide jurisdiction, but cannot try the most serious crimes, *e.g.*, murder, treason, or bigamy. Trial is by jury. The courts are of two kinds. Those which sit for the county are presided over by magistrates for the county; those for boroughs by experienced barristers known as " Recorders." Courts of Quarter Sessions also hear appeals from Petty Sessions

3. *Courts of Assize.*—England and Wales are divided into a number of circuits of very ancient origin, each comprising a number of Assize towns. One or more judges of the High Court go on each circuit at least three times a year. Their criminal jurisdiction is unlimited, and they also deal with such civil cases as can be conveniently dealt with locally rather than at the High Court of Justice in London. A great many divorce cases are thus disposed of.

The Central Criminal Court, or Old Bailey, as it is popularly known, is the seat of the Assizes for the City and County of London and certain parts of the home counties. Because of the immense population of this area, the Sessions are held once a month, and four courts are held at a time.

4. *The Court of Criminal Appeal* —This court is situated in the Royal Courts of Justice Building in London and usually consists of two judges of the Queen's Bench and the Lord Chief Justice. Appeals from Quarter Sessions and the Assizes lie to this court, which has powers to quash, reduce, or augment sentences on appeal

5. *House of Lords* —An appeal from the Court of Criminal Appeal lies to the House of Lords with the permission of the Court or of the House of Lords itself.

The constitution of the House of Lords as a judicial body is discussed on another page.

II. The Civil Courts.—1. *The County Court.*—There are about 500 County Courts in England and Wales which are grouped into circuits (not the same as the Assize Circuits). A County Court Judge visits each court at least once a month. Broadly speaking, his function is to try civil actions when the amount involved is not over £200, or in some cases £500

2. *High Court of Justice.*—The High Court of Justice is one of the two branches of the Supreme Court of Judicature, the other being the Court of Appeal, described below. The High Court deals with all civil cases, except those dealt with by the County Courts or by the civil side of the Assizes. Since 1873 it has been divided into three divisions·—

(1) the Queen's Bench Division, which is principally concerned with Common Law cases (*e g.*, defamation, breach of promise, damages for injuries, or breach of contract);
(2) the Chancery Division, whose functions have already been outlined; and
(3) the Probate, Divorce, and Admiralty Division, whose title is self explanatory.

3. *The Court of Appeal.*—Appeal lies as of right from decisions of the County Court and from the High Court of Justice to this court. Appeals are heard by courts consisting of three appeal judges, at the head of whom is the Master of the Rolls. The court can dismiss an appeal, allow it or make a fresh order as to damages or costs, or order a new trial.

4. *The House of Lords* —Appeal lies from the Court of Appeal to the House of Lords, with the permission of the Court or of the House of Lords. Only the " Law Lords " (or " Lords of Appeal in Ordinary "), who are eminent lawyers and life peers, and certain other high judicial appointees assist when the House of Lords is constituted as a judicial body to hear either civil or criminal appeals They are presided over by the Lord Chancellor, who is the head of the English Judiciary While other judges are appointed for life, his appointment is a political one, and he retains office only during the tenure of power of his party He is, of course, always an eminent lawyer.

Judicial Committee of the Privy Council.—This is a committee of lawyers, drawn from the Privy Councillors, who hear appeals from decisions of colonial and ecclesiastical courts.

Juvenile Courts.—This is a special kind of Magistrates' Court to deal with accused persons under the age of seventeen. The magistrates chosen are specially qualified for the work, and where possible a woman is appointed as one of the three Magistrates who constitute the Court. The Court is held in private away from the ordinary court room. The object of the Juvenile Court is to introduce into the trial a plan to reform the offender by providing for the care and protection which he may need, by removal from undesirable surroundings, and by subsequent edu-

cation or training. In these objectives the Court has the co-operation of social workers, including Probation Officers.

Probationary Officers are attached to particular Courts, sometimes a Magistrates' or a higher court. Sometimes an offender is not sentenced to punishment, but is released "on probation," that is on the condition that he behaves well and follows directions given by the Court or by a probation officer. Such an officer is a trained man (or woman) who advises, assists, and befriends people who have been committed to his care by a court of law. The probation officer, by his assessment of the social background of the offender, can advise the court upon the wisdom of putting the offender on probation. The probation officer by his understanding can so befriend an offender as to provide a basis for his rehabilitation. He undertakes the "after care" of those released from prison or Borstal or approved schools, to which juveniles are sent.

Legal Aid and Advice.—If you need help in problems, disputes, or Court cases you should know about legal aid and advice. The help of a lawyer of your own choice is within your means. You can get legal advice on questions of English law from a solicitor, whatever your means, for £1 and if your means are small such advice may be had free or for 2*s.* 6*d.* You can get legal aid, if your means are small, to make or defend a claim where there is not yet any question of taking or defending proceedings in a Court. You can also get legal aid for most Court cases in Courts of England and Wales, whatever your nationality if your means are moderate (in certain circumstances a person with an income as high as £30 a week may qualify), either free or for a contribution which you can afford. You should obtain the pamphlet *Legal Aid and Advice* from one of the Legal Aid Local Offices or Local Committees (of which there are 110) and their addresses can be ascertained from Citizens' Advice Bureaux, Court Offices, local government offices, or the telephone directory. The No. 1 (London) Legal Aid Area Office is 29–37 Red Lion Street, London, W.C.1. The principal address in Scotland is Legal Aid Central Committee, Law Society of Scotland, 34 York Place, Edinburgh 1.

OUTLINE of the BRITISH COMMONWEALTH.

The Commonwealth is a free association of sovereign, independent States—the United Kingdom, Canada, Australia, New Zealand, India, Pakistan, Ceylon, Ghana, Malaya, Nigeria, Cyprus, Sierra Leone, Tanganyika, Uganda, and Jamaica and Trinidad. So vast and complex an association has not been easy to define with precision. For a long time the term "British Empire" was used, and the self-governing countries (other than the United Kingdom) were called "Dominions." These terms have now given place to "Commonwealth" or "Commonwealth of Nations" and "Members of the Commonwealth." The last term describes the sovereign countries named in the opening of this paragraph (*See also* **K189**.) Other parts of the Commonwealth, such as Colonies, while they may be described as "Commonwealth countries" are not *Members* of the Commonwealth.

The Nature of the Commonwealth.—The Commonwealth is not a federation, for there is no central government, defence force, or judiciary, and there are no rigid obligations or commitments between them. Nor is it a contractual association as the United Nations is. Like the United Kingdom itself the Commonwealth of Nations has no written constitution. But all its members have a broad community of interests, and they are bound together by a common sense of ideals and by a common interest in the maintenance of peace, freedom, and security. Although the Commonwealth includes about a quarter of the total population of the world about three-quarters of the Commonwealth's people live in India. The white population of the Commonwealth is only a small fraction of the whole. The diversity is further illustrated in religion, for the Commonwealth includes over 200 million Hindus, 100 million Moslems, and 80 million Christians. The same variety appears in climate and natural resources. But in spite of diversities of race, religion, language, and tradition, members share a common political heritage which has given rise to a broadly common pattern of institutions.

The Common Heritage.—All members have certain important constitutional features in common. They are parliamentary democracies, their laws being made with the consent of a freely elected parliament after discussion there. The government holds office because it has the support of a majority in that parliament. Ministers, who must be members of parliament, are collectively responsible for the actions of the executive and must answer in parliament for all governmental administration. These salient constitutional features are similar to those described above in the Outline of Central Government. Lower houses are elected by secret ballot on a basis of adult suffrage, and they have the power of the purse, since they alone can originate or amend financial legislation.

The Sovereign and the Commonwealth.—The Queen's legislative power in the parliaments of the Commonwealth is a formality—she reigns, though she does not rule, but she provides the element of continuity in the administration. The Queen is, therefore, Queen of the United Kingdom, Canada, Australia, New Zealand, Ceylon, Nigeria, Jamaica and Trinidad, Uganda, and Sierra Leone, and she is the symbol of their free association in the Commonwealth. India, Pakistan, Ghana, Tanganyika, Cyprus, and Malaya do not owe allegiance to the Queen, but accept her as the symbol of the free association of the member nations of the Commonwealth and as such the Head of the Commonwealth. The Queen has, therefore, in the first group above, a relationship with the individuals comprising each country and also a relationship with the nation as a collective entity. In the case of India, Pakistan, Ghana, Tanganyika, Cyprus, and Malaya, she has only the latter relationship. It was reported in 1962 that Nigeria would request Britain's co-operation in changing to a republican form of Government.

The Commonwealth in the World.—The Commonwealth as a whole, including the dependent territories, covers roughly speaking a quarter of the world's land surface and contains about a quarter of its population. The nations vary widely as has been explained, not only in size, background, geographical position, race, religion, language, but also in composition of population, industrial growth, and world importance. It is natural, therefore, that the approach of the different countries to international questions should vary, and on particular occasions they have voted on opposite sides in the United Nations.

Status of Member Nations.—The subordination of the Dominions, as they were then called, to the United Kingdom had ceased for all practical purposes many years before that fact was embodied in the Statute of Westminster, 1931.

The Right to Secede.—"The essence of the Commonwealth relation is that it is a free association of nations, with a common purpose, who belong together because they have decided of their own volition to give and to take their fair share in a world-wide partnership." These words were used when the Burma Independence Bill 1947 was being discussed. In 1948 Eire declared its separation from the Commonwealth and Parliament next year passed the Ireland Act 1949, recognising that Eire (known henceforward as the Republic of Ireland) had ceased to be a part of the King's dominions, while providing that the Irish Republic should not be regarded as a foreign country. South Africa withdrew its application to remain in the Commonwealth after it became a republic in 1961.

The Colonies.—As stated in the opening passage of this outline, the United Kingdom, in common

with other members of the Commonwealth, has certain dependencies which are described as "The Colonies." But this is a loose term, for "the Colonies" are not really all Colonies in the strict sense. What are loosely spoken of as Colonies are properly divided into Colonies, Protectorates, Protected States, Trust Territories etc.

Definitions.—*Colony.*—A territory belonging by settlement, conquest, or annexation to the British Crown.

Protectorate.—A territory not formally annexed, but in respect of which, by treaty, grant, usage, sufferance, and other lawful means Her Majesty has power and jurisdiction

Protected State —A territory under a ruler which enjoys Her Majesty's protection, over whose foreign affairs she exercises control, but in respect of whose internal affairs she does not exercise jurisdiction.

Trust Territory —A territory administered by the United Kingdom Government under the trusteeship system of the United Nations.

Condominium.—A territory over which responsibility is shared by two administering powers

Leased Territories —This term applies only to that part of the mainland of China which was in 1898 leased to Great Britain for ninety-nine years and is administered by the Government of Hong Kong.

Responsibility of the British Government —The British Government is responsible for the affairs of Colonies (properly called Crown Colonies) both internal and external, and for their defence, and their peoples are British subjects. Protectorates are governed in the same way as Colonies, but have not been annexed. The peoples of Protectorates are not British subjects but British-protected persons

The Countries of the Commonwealth.—At the end of the Gazetteer is a list of all the countries of the Commonwealth showing their land area and recent estimates of population. The list distinguishes between the sovereign members and the British dependent territories, and classifies the latter according to the kind of dependency Not all the British dependencies come exactly within the definition either of Colony or Protectorate, since, for historical reasons, many come partly under one heading, partly under another

The Ever-changing Commonwealth.—There have been three major changes in the evolution of the Commonwealth. First, a multi-racial character was introduced in the conception of the Commonwealth when the Union of South Africa became a self-governing dominion. For the first time an area with a majority of non-British population became a Dominion The second change was the Statute of Westminster, which recognised the independent sovereign and equal status of the members of the Commonwealth. But the essential European character of the Commonwealth still remained. It was in 1947 when India, Pakistan, and Ceylon elected to remain in the Commonwealth, that it changed its character from a political association of peoples of European stock into a world-wide community without any restrictions of colour or race.

CHANGES IN AFRICA

At the beginning of 1963 the number of countries which had achieved independence was thirty-three.

At the end of the Second World War there were only four independent states in Africa. At the beginning of 1960 there were ten.—

Egypt	Ghana
Sudan	Guinea
Libya	Liberia
Tunisia	Ethiopia
Morocco	Union of South Africa

During 1960 another seventeen countries became independent. They were:—

Mauritania	Togo
Mali	Cameroun
Senegal	Chad
Dahomey	Central African Republic
Niger	Congo (formerly French)
Upper Volta (Voltaic Rep.)	Gaboon
	Congo (formerly Belgian)
Ivory Coast	Madagascar (Malagasy Republic)
Nigeria	Somali Republic

In 1961 Tanganyika and Sierra Leone became independent.

In 1962 four more were added Algeria, Uganda, Rwanda, and Burundi

The Pattern of Africa.—The following notes offer a key to the pattern of the African continent although this pattern is constantly changing We have first the frontier which is beginning to appear between black Africa of the newly enfranchised states and the white dominated Africa in the south made up of South Africa, Angola, Mozambique, and Southern Rhodesia *See also* K194–6

Regional Groupings. At conferences of independent African states in Accra in 1958 and Addis Ababa in 1960 unity of action was affirmed. In 1961, however, a rift appeared Ghana, Guinea, Mali, Morocco, and the United Arab Republic held a conference at Casablanca in the light of events in the Congo They did not attend a later conference at Monrovia (in Liberia) which the twelve Brazzaville states (most of which emerged from French Equatorial Africa) attended with eight other states A wider conference between the two groups was held at Lagos in 1962, and another conference was planned for May 1963 at Addis Ababa in the hope of merging the two groups completely

The Casablanca Group consisted of Ghana, Guinea, Mali, Morocco, the United Arab Republic and Algeria They were broadly regarded as the more militant countries, advocating an ultimate federation for the whole continent (Pan-Africa)

The Monrovia Group (which included all the Brazzaville states) comprised —

Libya	Niger
Tunisia	Nigeria
Mauritania	Chad
Senegal	Central African Federation
Sierra Leone	Cameroun
Liberia	Gaboon
Ivory Coast	Congo (Brazzaville)
Voltaic Republic	Ethiopia
Togo	Somali Republic
Dahomey	Malagasy

They were regarded as the more moderate and traditionally-minded states. But this division of characteristics cannot be applied rigidly for the pattern is constantly changing and contacts between the two groups are increasing rapidly Nigeria, which has taken a leading part in bringing the two groups together, is itself moving towards national planning Nigeria has joined Ghana in denouncing associate status in the European Common Market, whereas the Brazzaville states are associated members

East African Federation.—So far back as 1948 an East African High Commission created the joint management of railways and harbours, a common currency, and other shared services This co-operation was seen to be so valuable that when Mr. Nyerere obtained power in Tanganyika in 1960 he was even willing to postpone his country's independence to secure a federal structure for the three East African territories (the other two being Kenya and Uganda) in which all three countries would secure independence simultaneously As it is there exists the potential nucleus of an East African Federation.

The Pan-African Movement is towards continental federation and is inclined to socialism and positive neutrality. The "union" of Ghana and

Guinea in 1958 was intended as a nucleus of a wider union; and when it was later joined by Mali was named, in 1961, the Union of African States. Another grouping is the Pan-African Freedom Movement of East and Central Africa (Pafmeca) which favours a federation which might one day extend to Nyasaland and Rhodesia as well as East Africa, while supporting continental unity. Three Afro-Asian Solidarity Conferences have been held, the last at Dar es Salaam in February 1963 and one of its features was a move to extend the scope of Afro-Asian solidarity to Latin America

The Central African Federation.—The Federation was formed in October 1953, and comprised the self-governing colony of Southern Rhodesia and the protectorates of Northern Rhodesia and Nyasaland The constitution provided for the continuation of the protectorate status of the two northern territories, Northern Rhodesia and Nyasaland. Within the Federation the three territories retained the same constitutional status as before, except in respect of those matters which were specially designated as Federal subjects.

Review of the Central African Federation Constitution.—The constitution provided that some time between 1960 and 1963 there should be a conference to review the constitution The United Federal Party (of which Sir Roy Welensky is the leader) advocated that the Federal Government should then take over the responsibilities now exercised by the Colonial Office in Northern Rhodesia and Nyasaland and that safeguards for African welfare should be the subject of a treaty between the Federation and the United Kingdom The Dominion Party advocated the declaration of independence in defiance of Westminster, excepting the protectorates of Nyasaland and Barotseland (which is the south-western part of Northern Rhodesia), which it would leave under the joint authority of Colonial Office and the Federal Government. The common characteristic of both parties was their attitude to race and the call for white supremacy The African National Congress of Northern Rhodesia and of Nyasaland called for the complete dismemberment of the Federation

The Monckton Report.—The Monckton Commission, which the British Government had set up on the construction, programme and framework best suited to achieve the objects contained in the Constitution of the Federation of 1953, reported in October 1960. It agreed that the present form of federal association was too much disliked by Africans to continue and their distrust would be impossible to dispel without fundamental changes It therefore recommended a number of constitutional and other changes including the right to secede

The Future of the Federation.—Early in 1963 Mr Butler visited the three countries of the Federation to advise the British Government on its future. As a result the right of each territory to secede from the Federation was conceded and the principle of independence through the normal processes agreed It was proposed to hold a conference later in the year to clarify the future course of events

Nyasaland (or Malawi, as it will be renamed).—Elections in 1961 gave a victory for the Malawi Congress Party led by Dr Banda who in February 1963 became first Prime Minister when the country attained the first stage of full internal self-government, the process being due to be completed in April 1963, Britain retaining special powers over finance The British Government had earlier recognised the right of Nyasaland to secede from the Federation

Northern Rhodesia.—By 1963 two African nationalist parties (led by Mr. Kaunda and Mr. Nkumbula respectively) formed the Northern Rhodesia Government by coalition. They called for secession from the Federation and for a new constitution on the principle of "one man one vote". On the subject of further constitutional advance Mr. Butler said that Northern Rhodesia had not yet reached the stage of internal self-government.

Southern Rhodesia.—At the end of 1962 a general election was won by the Rhodesian Front Party (Mr. Winston Field) Early in 1963 Mr. Field introduced bills prescribing harsh sentences on members of illegal organisations He called for independence but Mr Butler stated that it would not be possible to make Southern Rhodesia an independent country in the full sense while she remained in the Federation, itself not independent. No further changes would be made until there had been a full-scale constitutional conference.

OUTLINE OF THE UNITED NATIONS.

Charter of the United Nations.—The Charter of the United Nations was signed on June 26, 1945. The purposes of the United Nations can be divided into four groups (security, justice, welfare, and human rights) and the nations undertook to carry out four main duties (to settle disputes peacefully, to refrain from treating or using force, to assist in carrying out the Charter, and not to assist an aggressor). The UN affirms faith in the human rights of all without distinction of race, language, sex, or religion.

Membership of the United Nations.—The UN had one hundred and ten member countries in 1963. They were.—

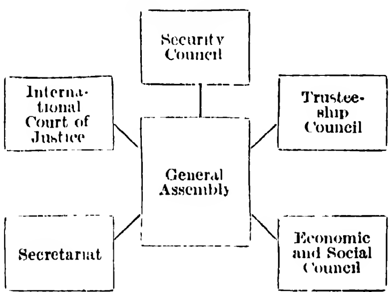
Afghanistan
Albania
Algeria
Argentina
Australia
Austria
Belgium
Bolivia
Brazil
Bulgaria
Burma
Burundi
Byelorussian S S R
Cambodia
Cameroun
Canada
Central African Federation
Ceylon
Chad
Chile
China (Taiwan)
Colombia
Congo (cap. Brazzaville)
Congo (cap Leopoldville)
Costa Rica
Cuba
Cyprus
Czechoslovakia
Dahomey
Denmark
Dominican Republic
Ecuador
El Salvador
Ethiopia
Finland
France
Gaboon
Ghana
Greece
Guatemala
Guinea
Haiti
Honduras
Hungary
Iceland
India
Indonesia
Iran
Iraq
Ireland
Israel
Italy
Ivory Coast
Jamaica
Japan
Jordan
Laos
Lebanon
Liberia
Libya
Luxembourg
Malagasy Republic
Malaya
Mali
Mauritania
Mexico
Mongolia
Morocco
Nepal
Netherlands
New Zealand
Nicaragua
Niger
Nigeria
Norway
Pakistan
Panama
Paraguay
Peru
Philippines
Poland
Portugal
Roumania
Rwanda
Saudi Arabia
Senegal
Sierra Leone
Somalia
South Africa
Spain
Sudan
Sweden
Syria
Tanganyika
Thailand
Togo
Trinidad and Tobago
Tunisia
Turkey
Uganda
Ukrainian S.S R.
United Arab Republic
U S S.R.
United Kingdom
United States
Uruguay
Venezuela
Voltaic Republic
Yemen
Yugoslavia

Present and Original Membership.—The classification of the present one hundred and ten members and of the original fifty-one members is as follows:—

	1945.	1963.
Americas	22	24
Western Europe	8	16
Soviet bloc	6	9
Asian	9	} 55
African	3	
Others	3	6
Total	51	110

Major Organs of the United Nations.—The UN have six major organs: (1) a General Assembly, (2) a Security Council, (3) an Economic and Social Council, (4) a Trusteeship Council, (5) an International Court of Justice, and (6) a Secretariat It is especially the inclusion of the third body on this list (with all the Commissions and specialised agencies which stem from it) which makes the UN more broad and balanced than the League of Nations

Principal Organs of the United Nations.



General Assembly.—The General Assembly occupies a central position in the structure of the UN. But its business is quite distinct from the Security Council It meets once a year. The Assembly can consider the general principles of co-operation for peace and security and disarmament and regulation of armaments. It can discuss any question concerning peace and security brought before it. It makes recommendations, but any question upon which action is necessary must be referred to the Security Council. The carrying out of its humanitarian work is the function of the new Economic and Social Council (dealt with below) which it elects and supervises. Further, the Assembly controls the purse.

The Security Council.—The aims of the UN are wide—from feeding starving peoples to encouraging self-government in backward areas —but it cannot advance towards the noble objectives set out in the Preamble unless peace is maintained. The principal organ to preserve peace and security is the Security Council It has eleven seats, of which five are permanently occupied by Great Britain, the U S A., the U.S.S.R , China, and France The China which is represented in the UN and on the Security Council is not, however, the Republic of China (or Communist China). It is the régime of Chiang-kai-Shek, who occupies Formosa. The other six are elected for two years by the General Assembly The further six members are (1963): Ghana, Philippines, Brazil, Morocco, and Norway. The Security Council sits continuously. It has two functions: (1) to promote the peaceful settlement of disputes and (2) to stop aggression Under the Charter, parties to a dispute have already promised not to use force, and to settle their quarrels peaceably and to refer their dispute to the Security Council if they really cannot reach a peaceful settlement. On its side the Council can call on the parties to settle disputes peacefully, it can investigate any situation likely to cause a breach of the peace, and at any stage it can recommend a solution.

The Veto.—At this point we must deal with the veto, which applies to substantive questions. A decision needs only seven out of eleven votes. Five of the seven votes must be those of the permanent members, namely the United Kingdom, the U S.A , U S S.R., China, and France In other words if any one of them says "No" to the use of force, even after a full investigation, the Council cannot use force to settle the dispute. Thus when it comes to imposing sanctions for a breach of the peace the assent is required of the Great Powers, and one of them may of course be a party to the dispute. If the Great Powers imposed sanctions on each other it would mean a major war in which the present UN would disappear. Partly in order to overcome the difficulty of the veto the Assembly has set up a Committee to remain in permanent session consisting of one representative of each member It is known as the Little Assembly, its formal title being the Interim Committee.

The Uniting for Peace Resolution, 1950.—The General Assembly had always been able to discuss matters of peace and security, although it could not make recommendations about them if they were being considered by the Security Council But in 1950, after the Korean crisis, a new decision was taken by the General Assembly whereby if there were some threat or breach of the peace on which the Security Council was in deadlock, the Assembly, on a vote of seven members of the Security Council, could consider it immediately and make a recommendation about it This decision, to which Russia and four other countries were opposed, was called the "Uniting for Peace" resolution. By this resolution, too, the Assembly could be called together within twenty-four hours It was the standing Interim Assembly which considered the Israeli-Egyptian dispute in November 1956.

The Economic and Social Council.—The UN pledged themselves to a broad humanitarian policy of which the following are salient points to promote higher standards of living, full employment; the conditions of economic and social progress; solutions of international economic, social, health, and other related problems, educational co-operation, universal respect for human rights; and the fundamental freedoms for all The main business of the Economic and Social Council is to carry out this broad policy To tackle these huge problems the Council established a number of important commissions and bodies, which fall mainly into the following categories.

Regional Economic Commissions

- Economic Commission for Europe (ECE)
- Economic Commission for Asia and the Far East (ECAFE)
- Economic Commission for Latin America (ECLA)
- Economic Commission for Africa (ECA)

Functional Commissions

- Technical Assistance Board (TAB)
- Transport and Communications
- Fiscal
- Statistics
- Population
- Social
- Human Rights
- Status of Women
- Narcotic Drugs

Special Bodies

- UN Children's Fund (UNICEF)
- Commissioner for Refugees

Intergovernment Agencies (previously called Specialised Agencies).—The agencies are organisations established by intergovernmental agreements, and their activities as a rule are co-ordinated by

the Economic and Social Council. The list of the thirteen Agencies are given below.

- International Atomic Energy Agency (IAEA)
- International Labour Organisation (ILO)
- Food and Agriculture Organisation (FAO)
- UN Educational, Scientific and Cultural Organisation (UNESCO)
- World Health Organisation (WHO)
- World Bank (Bank)
- International Finance Corporation (IFC)
- International Monetary Fund (IMF)
- International Civil Aviation Organisation (ICAO)
- Universal Postal Union (UPU)
- International Telecommunication Union (ITU)
- World Meteorological Organisation (WMO)
- Inter Governmental Maritime Consultative Committee (IMCO)

Several of these organisations were at work before the UN was set up. One such body is the ILO.

New Trends at the United Nations.—A development at UN is the increasing readiness to leave things to U Thant and more especially when he was confirmed as Secretary-General The Assembly did this during its 1962 sessions on the Congo and on Cuba They felt that one trusted man with the authority of 110 member countries is more effective than an unwieldy body U Thant thus received numerous requests to mediate in Cuba, in Hungary, in Southern Rhodesia, in Angola. There was an expansion of this attitude —the belief that a UN "presence" (official representatives of the Secretary-General) might ease tensions in trouble spots.

Features of the 1962 Assembly.—(1) Broadly speaking the Russians soft-pedalled their views at this Assembly. They did not press their earlier proposal for three joint Secretaries (the "troika" proposal) and agreed to confirmation of U Thant as Secretary-General More surprisingly the Russians made no serious effort to support Communist China in the debate on Chinese representation Further, although Russia, like France, refused to pay her share of expenses for the Congo operation, there was no recrimination

(2) The problems of the newly independent countries were a major preoccupation of the Assembly and one of its major decisions was to hold an international trade conference to concentrate on the problems of those countries This was due to be held late in 1963 or early 1964

(3) Colonial questions were naturally a major preoccupation. Strictures on British colonial policy were severe (in spite of the admission of Uganda during the session) But these criticisms were nothing like the bitter attacks on Portugal and South Africa. A resolution was passed demanding the postponement of the Southern Rhodesian elections The Assembly did not accept Britain's argument that she had no constitutional power to intervene in Southern Rhodesia. Sir Hugh Foot resigned as a British representative at UNO

(4) The Assembly decided to keep in existence the committee on colonialism set up in 1961. Its membership has been increased from 17 to 24.

(5) There was no progress on proposals for reforming the UN Charter The Communist members insist that no action be taken until Communist China is admitted

(6) The United States announced that she would make fresh efforts towards a settlement between Israel and the Arab countries who still refused to come to terms with the mere existence of Israel

(7) India declined to allow any form of UN intervention in the Sino-Indian struggle

(8) Mainly on U S insistence, the General Assembly dropped a resolution aiming at denuclearisation of Latin America This would have provided for international verification of Cuba as well as the rest of Latin America, but Cuba made it clear that she would support such a resolution only on condition that inspection would cover all U.S. bases in Latin America.

(9) The Assembly voted to seat representatives of the new republican régime of the Yemen in place of the Imam's representatives previously accredited

(10) A special session of the Assembly was due to be held in the summer of 1963 to deal with UN's financial crisis. The International Court held that the expenses of the UN's emergency operations in the Congo and the Middle East were part of ordinary UN expenditure and that members who defaulted were subject to the Charter rule, leading to loss of vote after two years.

The Congo and the United Nations.—The use of a United Nations Force in the Congo gave rise to much discussion as to the legality of the undertaking While it is impossible to deal adequately with such a complex issue in the space available here a few salient facts will assist the reader. The initiative came from the Congo Government itself In July 1960, widespread disorder having followed the proclamation of the Congo's independence, the Congo Government asked the United Nations for military assistance The request was not based solely on the breakdown of order but on the despatch to the Congo of Belgian troops in violation of a Treaty just concluded between Belgium and the Congo Republic The Security Council took a number of decisions in three Resolutions during 1960 all of which included a call to Belgium to withdraw its troops from the Congo These Resolutions were all directed to measures for the maintenance of internal order It has been argued that the maintenance of internal order is a domestic matter and, therefore, one which does not come within the jurisdiction of the United Nations Internal order is undoubtedly a domestic matter. But in the Congo affair there were two further relevant points First, where military assistance is provided upon the invitation of the government of a state this is not "intervention". It is true that when rival governments are contending for power it may be very difficult to determine whose invitation is valid Second, any threat to the peace ceases, by definition, to be essentially domestic

The Distinction between Maintenance of Internal Order and Intervention in Internal Conflicts.—Events in the Congo illustrated how difficult it is, where the mechanism of government has broken down, for a small force trying to maintain order not to get entangled in internal conflicts for power Had there been a single government of the Congo the position of the United Nations would have been relatively simple. But there was a split (between President Kasavubu and Mr. Lumumba) and the emergence of a strong separatist movement in the province of Katanga The United Nations were then faced with a request for use of UN troops to subdue the breakaway province of Katanga At this point Mr Hammarskjold, then Secretary-General of the United Nations, explained that the conflict between the Central Government and Katanga was an internal matter, provided that Belgian troops were withdrawn Thus the issue was clouded, and it was clouded still further by the fact that the United Nations Force could not restrict the use of force to occasions of self-defence. They had to use force to protect civilians threatened by troops no longer under control and who had resorted to pillage and massacre As the situation deteriorated there was a threat by the Central Government to seek military assistance outside the United Nations unless that body could end violence in dissident provinces. The Security Council thereupon, in February 1961, authorised military action should that be necessary to prevent civil war. But they made it clear that the United Nations would not become parties to an armed conflict or use force to impose a political settlement. The United Nations Force was obviously drawn into a difficult position but its operations were conceived as a police action. By 1962 there was a prospect of increasing political stability in the Congo.

The Campaign for Nuclear Disarmament has, as its purpose, to press for a British initiative to reduce the nuclear peril and to stop the armaments race. It is argued that the possession of a few hydrogen bombs and Britain's part in the nuclear arms race is both morally wrong and rationally

indefensible. Whatever agreements might or might not be reached, it is urged that Britain, with as many nations with her as possible, but if necessary on her own, should renounce unconditionally the use and production of nuclear weapons, by herself or in her own defence The Campaign puts forward four immediate proposals:

1. That the British Government should halt patrol flights of aeroplanes equipped with nuclear weapons, in view of the danger, if the plane crashes, from plutonium, and the graver danger that such accidents may be mistaken for enemy action and trigger off a nuclear war
2. The stopping of testing of nuclear weapons
3. That the Government should not proceed with the establishment of missile bases in Britain. They would make Britain the first target if a nuclear war breaks out
4. That Britain should refuse to supply other powers with nuclear weapons Three nuclear powers are bad enough Ten or twenty would be disastrous.

In the view of the sponsors of the Campaign the so-called "Great Deterrent" is a myth The risks we run now, the argument continues, are far greater than any involved in renunciation. Civilisation cannot survive a nuclear war.

The Committee of 100 organises sit down and other protests against nuclear armaments It differs in method from the Campaign for Nuclear Disarmament whose protests are constitutional and do not involve breaches of law Bertrand Russell said, "At present it seems an even chance whether any human beings exist forty years hence If man is to survive, the trend must be reversed."

Nuclear Tests.—The negotiations at Geneva for an agreement to stop nuclear tests, which had been going on for some three years, were shattered by Mr Khrushchev's announcement in October 1961 that the Soviet Union were planning to explode a 50-megaton bomb before the end of October He pleaded that the Western Powers were preparing a rocket war against "the Socialist world" and the Soviet Union was obliged to strengthen its defences The series of Russian explosions broke the moratorium on tests which had been exercised by the United States, Great Britain and Russia The difference in outlook at the Geneva conference may be described as follows The big Western Powers had wanted a nuclear test-ban treaty with built-in controls as a preliminary to a disarmament treaty The Russians demanded test-ban negotiations within the general framework of disarmament and not as a separate piece of negotiation The non-nuclear Powers wanted simply to see an end to testing regardless of anything else

Disarmament Conference 1962.—In March 1962 negotiations began once more on this subject, this time at Geneva between seventeen countries There was one important difference from all the Conferences which had gone before. This is the fact that in September 1961 the United States and the Soviet Union agreed on a series of broad principles which they believed could be the basis for multilateral talks They both agreed that "disarmament must be general and complete and that war is no longer an instrument for the settlement of International problems." The reader has the advantage over the writer of these notes since he will know what progress was in fact made at Geneva in solving the very real problems which arose from the concrete proposals tabled by the USSR and the USA when the Conference opened. These are analysed below.

The American Disarmament Plan: Stage One.—In the first stage, which would take three years, the U.S. proposed the cut-off of the production of fissile material; the transfer of 50 metric tons of uranium-235 to peaceful purposes; a reduction of 30 per cent in the means of delivery of nuclear weapons; and the reduction of forces to 2 1 million men. They also proposed the establishment of observation posts at transport nexuses and at airfields during this stage one and the international inspection of testing sites.

A Comment on the American Proposals.—The proposal that each side should during the first stage turn over 50 metric tons of weapons grade uranium-235 to peaceful purposes is a proposal to the strategic advantage of the United States because that amount is believed to be about one-seventh of the American stockpile while it might be as much as one third of the Soviet stockpile

The Russian Disarmament Plan: Stage One.—The Russians in stage one, which would last fifteen months compared to the Americans' three years, proposed the total abolition of all means of delivery (that is to say not only of means designed to carry nuclear weapons but all those capable of carrying them), the destruction or conversion of all factories or parts of factories producing such means, the withdrawal of all forces stationed outside national boundaries, and the reduction of force levels to 1 7 million men, including civilian employees.

A Comment on the Russian Proposals.—The result of the proposal calling for the withdrawal of forces outside national boundaries would be the ending of NATO and, also, of course, the end of the Warsaw Pact But it would also leave conventional Soviet forces 500 land miles away from the dividing line in Europe whereas American forces would be three or four thousand sea miles away

Difficulties over Inspection.—The preceding brief comparisons indicate the difficulties of phasing and of balance, but there are difficulties over the subject of inspection The Americans in their opening proposals made two advances on previous plans First they adopted the idea of Sohn Zones (This system of Zones is named after Professor Sohn referred to below. Each side divides itself into, say, twenty geographical zones The inspector picks one and inspects it One cuts, the other chooses) The other new feature was the American agreement to "self-inspection" which they had previously rejected and which at first sight certainly seems an unconvincing method of control (Under self-inspections it would be possible to use in an aeroplane a film for the inspectorate, which would see straight down between point A and point B)

Inspection of what remains.—The US and the USSR have interpreted inspection differently Suppose at any given moment a hundred weapons are to be destroyed and a hundred retained the East would ask the inspectorate to certify the destruction of a hundred. But the West would require the inspectorate to certify further that not more than a hundred weapons remained The problem therefore arose as to how a check could be devised on what armaments remain without offering to the intelligence services a field of information outside the strict scope of the inspection.

World Government.—In 1961 the Parliamentary Association for World Government celebrated the tenth anniversary of its foundation and there were two World Conferences, one in Venice and one in London. The Association believes that only through a world ruled by law can peace be established permanently on this earth—just as it is only through the rule of law that we, in these islands, enjoy peace The Association is therefore trying to set up a world parliament, world laws, a world executive government with a world force to see that laws are obeyed This could of course be the United Nations with an amended Charter to give it the powers it now lacks. The British Parliamentary Group for World Government includes Members of Parliament of all parties and of both Houses. A classic work on the subject remains a book first published in 1958 and now revised (and published also in a cheaper edition): *World Peace through World Law* by Grenville Clark and Louis B. Sohn, published in this country by

the Oxford University Press. It describes in detail world institutions and basic rules required for the effective prevention of war. It is the most authoritative treatment that has appeared so far of the revision of the Charter of the United Nations. *See also* **C14**.

OUTLINE OF EUROPEAN ORGANISATIONS.

1. Introduction.

This outline is an attempt to explain the various organisations through which European countries are trying to co-operate. It is hoped that the reader, with the help of the chart (**C38**), will find the pattern less bewildering than at first appears, and that he will be in a better position to understand the proposals which have been made, and which are also explained, for simplification of the whole design. The destruction in Europe in the Second World War emphasised the need for greater union, both for recovery and for defence. A bewildering array of organisations has sprung up. They differ in form, in function, and in membership. Some overlap in function. Some are much less effective than others. The edifice is not, moreover, built on a single harmonious plan. Beneath the edifice are two different kinds of foundations, that is to say, two rival theories. These two theories (the federalist and the functionalist) are explained as the story unfolds. The story traces three main streams—the military, the political, and economic developments—and describes the bodies which evolved in each stream. The account concludes with an explanation of some suggestions which have been made to make the organisations more effective by better co-ordination.

Historic Origin of European Unity.—Sully, the famous Minister of Henry IV, King of France, outlined, in 1638, a proposal for achieving European unity and putting an end to war in Europe. He called it the "Grand Design." It was revived in modern dress by Monsieur Briand, the French Prime Minister, in 1929. During the War (1943) the concept of a United Europe which should be created after victory was won was outlined by Sir Winston Churchill: and he returned to the subject in his famous speech at Zurich University in 1946.

Two Starting Points: ERP and the Brussels Treaty.—There were two main sources of the present numerous European bodies. The first was the European Recovery Programme in 1947 (ERP), and the second was the Brussels Treaty of 1948.

The European Recovery Plan was popularly known as the Marshall Plan, as it was the result of the invitation made in 1947 by Mr. Marshall (then U.S. Secretary of State) to the European countries to draft a programme to put Europe on her feet economically. The U.S.A. was ready to give this aid if the countries concerned would agree on co-operation and plan their needs. In March 1948 the countries concerned created the Organisation for European Economic Co-operation (OEEC) to administer the programme of aid. This body was replaced by the Organisation for European Co-operation and Development in 1961.

The Brussels Treaty, 1948, was the other main source of the West European organisations. In March 1948 Britain, France, and the Benelux countries (Belgium, Holland, and Luxembourg), agreed at Brussels to pursue a common policy on economic, political, and military collaboration, and to promote a better understanding of the principles which form the basis of the common civilisation of Western Europe. It also provided for the creation of a Consultative Council. This Council, when formed, was the Council of Europe, and it is described below, together with an account of all the organisations which stemmed from the Treaty. Italy and the German Federal Republic joined the Brussels Treaty Organisation in May 1955, which then became the Western European Union.

2. Military Organisations.

The Brussels Treaty and the Western Union Defence Organisation.—As we have seen, under the Brussels Treaty, so far back as 1948, the five Western Powers concerned pledged themselves to military collaboration; and in the same year they formed the Western Union Defence Organisation. At that time policy was being framed by a fear of a revival of German aggression. But in time this fear was replaced by distrust of the Soviet Union. There were two developments. In the course of seven years the Western Union Defence Organisation was transformed by the inclusion of the German Federal Republic itself and of Italy into a larger body called the Western European Union. How this change came about is described in the following paragraphs, which tell the story of the creation of the new Federal Republic of Germany, the proposal for a European Defence Community (which did not materialise), and the eventual emergence of Western European Union (in 1955). The second sequel of a military character of the Brussels Treaty was the creation of the North Atlantic Treaty Organisation (NATO). Whereas WEU is a regional organisation, NATO has an even larger range, as its members include Canada and the U.S.A. An account of NATO follows the story, to which we now turn, of the emergence of the new German Republic and its eventual incorporation in WEU.

Government of Germany after the War.—As a result of Germany's unconditional surrender on June 5, 1945, all power in Germany was transferred to the Governments of the four principal Allies. By decisions at Potsdam in 1945 that power was exercised by the Commanders-in-Chief of the U.S.A., the United Kingdom, the Soviet Union, and France, each being responsible in his own zone of occupation. On matters affecting Germany as a whole, the four would be jointly responsible as members of the Control Council. Berlin was divided into four sectors of occupation.

The London Conference 1947 of the four Foreign Ministers concerned failed to agree on a joint German settlement. Unfortunately, the effect was to set in motion political and economic developments which were speedily to make Germany the battleground of the conflict of ideas between Soviet Russia and the Western Powers. The Allied Control Council could no longer function efficiently, and by the end of 1948 four-Power rule had virtually collapsed and the partition of Germany was complete. A federal Parliament and Government were formed in Western Germany. The Soviet zone prepared a rival form of Government for East Germany.

Western Germany's New Status.—In May 1952 the German problem acquired a new complexion, when the so-called "Contractual Agreements" were signed by the three Allied Powers and Western Germany at Bonn. These Agreements did not form a Peace Treaty, but they attempted to define how W. Germany and the three Allied Governments should work together. Sovereignty was to be restored to Germany and she was to enter a military alliance with France. Indeed, a Treaty called the European Defence Treaty was drawn up between the four Powers, with Italy and the Benelux countries, which was to fit German Armed Forces into a Western European system. But this system, called the European Defence Community, never came to fruition as such, owing to the refusal of France to ratify the Treaty in 1954.

Collapse of EDC.—With the collapse of EDC there was a halt to the idea of a Political Community designed to embrace both the proposed EDC and the existing European Coal and Steel Community. It was logical that these two Communities formed by the same countries should not have separate institutions but should take their place within a single political community.

The London Nine Power Conference and the **Paris Agreements, 1954.**—Nine Powers met in

London to devise a substitute for EDC. They were Belgium, Canada, France the German Federal Republic, Italy, Luxembourg, Netherlands, United Kingdom, and the U.S.A. The Conference considered how to assure full association of the German Federal Republic with the West and the German defence contribution. All the decisions which were reached formed part of one general settlement and these were embodied in agreements signed shortly afterwards in Paris. These decisions included the following:—

1. The occupation of W. Germany by Great Britain, the U.S.A., and France should end.
2. The German Federal Republic and Italy should join the Brussels Treaty Organisation.
3. The W. German Republic was admitted to the North Atlantic Treaty Organisation (NATO).

Western European Union.—These agreements took effect on May 5, 1955, when the occupation régime in Western Germany ended and the Republic attained full sovereignty and independence. At the same time the Republic became a member of the Western European Union (the expanded Brussels Treaty Organisation), which came into formal being on May 5, 1955, and also of NATO, to which we now turn.

The North Atlantic Treaty, 1949.—The founder members of this Pact (which widened the scope of the Brussels Treaty) were Great Britain, the U.S.A., Canada, France, Holland, Belgium, and Luxembourg. The parties agreed that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agreed that if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defence recognised by the Charter of the UN, will assist the party so attacked.

3. Political Organisations.

Federal Union.—The development of greater political unity among the European countries may be best introduced by a word about the federalists. The Federal Union had, before the War, urged a federation of Europe as a first step in a progression towards a world federation. The Federalists advocated the surrender of absolute national sovereignty, a part of that sovereignty being vested in a federal authority. This authority, it was urged, should possess a government responsible to peoples and not to the States. It should have a Supreme Court to settle disputes between States which are members of the federation, and have an armed police force to uphold its decisions.

The Hague Congress, 1948.—Several schools of thought were represented at the Congress, one main difference being between the federalists, who want to create a real federation in Europe, and those, like the United Europe Movement, who were not committed to a federation in so far-reaching a sense. The Congress declared that the European nations must transfer some part of their sovereign rights so as to secure common action, and it demanded an early convening of a European Assembly chosen by the Parliaments of the participating nations. But in the event the political reality has not become so radical as the surrender of any sovereign rights to the Council of Europe.

The Creation of a Council of Europe.—In May 1949 the Foreign Ministers of the ten countries consisting of the five Brussels Treaty Powers and Denmark, Eire, Italy, Norway, and Sweden, concluded a formal Agreement called "The Statute of the Council of Europe." It set up a Committee of Ministers and a Consultative Assembly, forming together a Council of Europe. The Council was established twelve months after the Hague Congress, almost to a day. The Committee of Ministers provides for the development of co-operation between governments, while the Consultative Assembly provides a means through which the aspirations of the European peoples may be expressed. The seat of the Council was fixed at Strasbourg.

Council of Europe.—The Council came into existence in August 1949, and the Assembly opened at Strasbourg when M. Spaak was elected President. Mr Churchill (as he then was) sat as an ordinary member. Procedure is a combination of British and Continental systems, but the design of the chamber follows the Continental pattern, delegates sitting at tables arranged to form a semicircle. In November 1949 the Council of Ministers agreed to meet the wishes of the Assembly that it would not in practice exercise its right of control to fix the agenda of the Assembly.

The Consultative Assembly.—This, the deliberative organ of the Council, is empowered to debate and make recommendations upon any matter which: (i) is referred to it by the Committee of Ministers with a request for its opinion, or (ii) has been approved by the Committee. The Assembly consists of representatives of each member state appointed by national parliaments. All resolutions of the Assembly require a two-thirds majority of the representatives casting a vote. The Assembly meets annually.

The Responsibility of Members of Assembly.—The Assembly comprises over two hundred individual members of Parliament from fifteen different countries. Although they are entitled to group themselves on any particular issue if they choose, a member is in particular relationship to his country and his party or even to his constituency. There is therefore a position of some confusion and subtlety. Originally the Deputies in the Strasbourg house were seated in alphabetical order of their names; today they sit grouped in political parties.

Relations with National Parliaments.—The attempt made by the Joint Committee between Ministers and the Assembly to act as an organ of co-ordination between the two sides of the Council has not satisfied the Assembly. It has therefore set up a Working Party to analyse the relations between the Assembly and national parliaments. This Party tries to see what steps can be taken in each national parliament to secure consideration of recommendations and ratification of Conventions which have been approved at Strasbourg. They have gone so far as to appoint a spokesman for each country.

What Has the Council of Europe Achieved?—The Council plays an important part in law-making. It has itself framed and launched important Conventions like that on Human Rights, and it also frames general principles and gives opinions on texts of laws. On the diplomatic side it prepared the way for a solution of the Saar problem, which had divided France and Germany since the War. It is working on the simplification of frontier formalities, and it is concerned (in common with several other international bodies) with refugees. Among other actions, it has encouraged the growth in reciprocity between countries of their social services, and established a European Court of Human Rights.

4. Economic Organisations.

The Organisation for European Economic Co-operation (OEEC).—We now turn to the third stream, the economic. We have seen that OEEC was created to administer American (Marshall) aid. But it needed also to re-create a sound European economy. The allocation of aid continued until 1952; but the practice of mutual consultation on economic matters continued in order to carry out long-term programmes. Owing to the nature of its original task of distributing Marshall Aid, the U.S.A. and Canada became associate members of the Organisation. In 1961 these two countries formed with members of OEEC the Organisation for Economic Co-operation which replaced OEEC and is described below.

European Coal and Steel Community.—A further economic development came in 1950 with the proposal for the co-ordination of coal and steel

production in Germany, Belgium, France, Italy, Luxembourg, and the Netherlands. The organisation of the Community is an example of co-operation on a supra-national basis, since the governing authority is not responsible to the individual governments of member countries but only to the Community. The High Authority has the right to deal directly with the coal and steel enterprises of the Community without passing through national governments. In 1954 Great Britain formed a Standing Council of Association with the High Authority for consultations on coal and steel and for co-ordination where necessary.

The European Economic Community (EEC), or Euromarket.—In 1955 "the Six" (namely the countries in ECSC) decided to drive towards further economic integration. This decision was taken at Messina, and the six are sometimes referred to as the Messina Powers. The EEC was established by a Treaty of Rome in 1957 and is an extension to the whole economic field of the institutional method of co-operation already adopted in the European Coal and Steel Community of the Six. The principal institutions are the Parliamentary Assembly (which is common to EEC, ECSC, and Euratom), a Council of Ministers, and an executive Commission of nine members. The common Parliamentary Assembly is now called the European Parliament. The Community is merging the Six into a single economic unit by harmonising economic, social, and investment policies and establishing a common market in trade.

What is a Common Market?—A common market is a trading area with no internal tariffs (import duties) or quotas (which are quantitative restrictions on imports) and a single external tariff and quota structure. The first tariff reductions inside the Six (10 per cent.) took place on January 1, 1959. By January 1962 there had been cuts totalling 40 per cent. in internal tariffs. During 1960 the Council of the Community resolved to speed up the process of further reductions which, on original intentions, would have taken from twelve to fifteen years so as to aim at complete liberalisation of internal tariffs by 1966.

A European Free Trade Area.—When the Six were discussing the Common Market the British Government declared (1956) that they would consider joining a free-trade area in Europe. Although she would not join the Common Market scheme itself, she would consider sharing in the stage-by-stage reduction of inter-European tariffs on all non-agricultural goods. They would not attempt (unlike the Six) to standardise their own tariff walls in relation to the world outside the European free-trade area. Such a free-trade area would be independently controlled with permanent co-ordination with EEC. In November 1958 France rejected the British proposals for linking the six European common-market nations with the eleven other OEEC countries in a free-trade area. It appeared to the French impossible to establish a free-trade area between the six treaty powers and the other eleven OEEC countries without a single customs tariff between all of them and the outside world and without measures of harmonisation in the economic and social sphere.

The European Free Trade Association.—Thereupon seven countries outside the area of the Six formed a European Free Trade Association. They were Great Britain, Austria, Denmark, Norway, Portugal, Sweden, and Switzerland, and they agreed upon a plan at Stockholm in November 1959. Inside the free-trade area comprising these seven countries it was contemplated that there would eventually be no internal tariffs or quotas, but member states would retain separate external systems. The Seven, upon the foundation of their Association, immediately offered friendly co-operation to the existing Common Market. But the problem of finding a political link—called by the diplomatists the problem of the three half-crowns (seven and six)—remained a difficult one. *See also* **G11(1)**.

Britain's Application for Membership of the Common Market.—In the autumn of 1961 Britain applied for membership of the Common Market. Membership would provide this country with a much improved export opportunity but could lead equally to a sharp intensification of competition in our home market. In terms of population, purchasing power, production and growth, Western Europe is an exceptionally dynamic economy. The negotiations were stopped upon the veto of France in January 1963, and they were adjourned indefinitely. The political aspects of the Common Market are discussed below.

Organisation for Economic Co-operation and Development.—This new body has taken the place of OEEC. Canada and the United States, who were associated members of OEEC, joined with the eighteen members countries of that body to set up OECD. The convention was signed in Paris in December 1960, and the new body came into existence in the autumn of 1961. Thus Canada and the U.S.A. join in facing the broader objectives and the new tasks of today, namely to achieve in Europe the highest sustainable economic growth, employment, and standard of living, to contribute to economic development; and to expand world trade on a multilateral and non-discriminatory basis, in accordance with international obligations.

Economic Commission of Europe.—As explained in the preceding outline of the UN, ECE was the first of the great regional commissions to be set up by UNO. It was created in 1947 to concert action for the economic reconstruction of Europe, and it was hoped to strengthen economic co-operation between all European members of UNO. Russia and some of the Communist Eastern European countries are members of ECE, and it is the only European organisation where the Western bloc and Soviet powers can meet for discussion and action.

Euratom.—The six countries which proposed the Common Market also discussed the creation of a European organisation for the peaceful uses of atomic energy. Euratom, as it is called, has prior claim on any uranium, plutonium, or thorium in member countries and would distribute it to atomic-energy establishments without discrimination. In the event of deficiency materials are allocated on needs. The institution of Euratom is dealt with in the Treaty of Rome establishing the European Economic Community.

5. The Political Aspects of Membership of the Common Market

The economic aspects are dealt with in **Section G, Part III**. Here we examine the political aspects which are more problematical. The Treaty of Rome, 1957, which had established the European Economic Community defined (in Articles 2 and 3) the principles and objects for which the Community is to work. Those articles specify in detail the steps for creating a Common Market, for approximating the economic policies of member States, the promotion of harmonious development of economic activities, and raising the standard of living. But the aim of "closer relations between its member States" is stated without elaboration. It is into this gap that speculation is poured. No limit is set in the Treaty to the process of integration; on the other hand there is no commitment to join a Federation of Europe. While member States commit themselves to a common policy on a number of economic issues there will be co-ordination of national policies designed to take account of the needs of the rest of the Community.

Two Kinds of Political Aspects.—We need to distinguish between two things. First, the machinery by which the aims of the Common Market are to be achieved—the Commission, the Council of Ministers, the European Assembly, Court of Justice, and so on. This may be described as the political machinery of the Common Market. Second, we have to think of the kind of political relationship which will grow up, either

by deliberate design or practical development, between member countries We may think of the first set of facts as the engine or locomotive of the Common Market train; and we can regard the second as what sort of journey the train will take —will it take a direct run to federation or follow some other line? One, therefore, is how the Market will tick, the other where the Market will take the new Europe. Both these aspects are the subject of controversy and speculation. We take now the latter aspect, dealing later with the mechanism of the Market

Where is the Market going?—The answer, as we have suggested is speculative, but the issue is much more in doubt after General de Gaulle's declaration in January 1963 which, in effect, closed the door against Britain's entry to the Common Market The Europeanists had visualised a rapid advance to federation, a union of states whose members surrender their sovereignty over the most important subjects, such as foreign policy, defence, and tariffs, to a central government, while keeping control over some part of their internal affairs But in 1963 it was seen that France was likely to head for a confederation, that is to say an association of Governments with their powers unsurrendered, a council of Heads of States taking decisions by straight though weighted majority vote Since France and Germany have almost 60 per cent of the EEC population the meaning of the Franco-German accord signed in 1963 becomes clearer. Apart from these two schools there were the experimentalists who were not sure where the present process led, the pragmatists who were concerned only to rationalise commerce and gave little thought to political union, and those who were attracted to the belief that EEC offered a new cultural or even spiritual phenomenon.

Attitudes of Mind.—This variety of view reflects variety of attitude The Europeanists, who include Jean Monnet, former head of the Coal and Steel Community, look upon themselves as taking the first step to conquering the excesses of nationalism and sovereignty which have caused wars and blocked prosperity They show a determination for reconciliation between defeated and impoverished countries to work together to restore lost fortunes Will the end, however, be the transformation of half a continent into a super-State but with aggressive and intolerant characteristics which will not have reduced the excesses of nationalism? Or will a European union be successfully led by those who genuinely want to see Europe fulfilling a civilising and pacific mission?

The Political Roof over the Community.—Whatever the attitudes of private people the fact remains that the Common Market has far-reaching political implications and that those who created the Market regard it as a step to a political objective. In July 1961 the Heads of State of the Six decided at Bad Godesberg, Germany, "to give form and figure to the will for political unification which is already contained in the treaties founding the European Communities" and to call for proposals for giving "a statutory character within the shortest time to the unification of their peoples" The body appointed to frame these proposals is known as the Fouchet Committee When on 10 October 1961 Mr Edward Heath made his celebrated speech in Paris to the Six outlining the British Government's position perhaps the most important statement of Britain's long-term policy towards Europe was adherence to the decision, referred to above, taken by the Six in July 1961 and now known as the Bonn Declaration.

The Organs of EEC.—The machinery of government of the European Economic Community consists of.

1. The Council
2. The Commission
3. The Court
4. The Parliament
5. The Economic and Social Committee, and
6. The Ambassadors of the member Governments.

The meetings of Ambassadors form unofficial permanent liaison between Council and Commission. Let us examine the five official organs.

The Council issues regulations and decisions which are, upon issue, binding in law on all member States. It consists of one member from each member State (normally a Cabinet Minister) They have votes as follows·

France	4 votes
Germany	..
Italy	..
Belgium	2 votes
Holland	..
Luxembourg	1 vote

The voting practice in 1962 was to decide a few minor matters by majority vote, on many matters by unanimous vote, and on an increasing number by qualified majority, namely 12 votes out of the total of seventeen Thus, in the last category, any two countries which can muster 6 votes between them can block a decision There is no machinery for getting out of the consequent deadlock.

The Commission.—Whereas the Council consists of politicians the Commission consists of permanent officials. There are nine members appointed by Governments, for a minimum term of four years and not more than two members may come from any one country Its business is to further the general purposes of the Treaty and decisions are by majority vote From the Commission flow two streams·—

(a) Proposals, which it sends to the Council.

(b) Under powers of its own —

1 Decisions to named countries and binding on them
2 Directives to named countries to achieve certain results, without specifying the means
3. Recommendations and Opinions, which are not binding
4. Authorisations without which many things are forbidden

The Court, whose procedure is wholly Continental, consists of seven Judges appointed by Governments for a maximum of six years Its word is final on the interpretation of the Treaty, on the rules made under the Treaty, and on the legality of all the actions of the organs of the Community.

	Council of Ministers	Court of Justice
Commission of European Coal & Steel Community	Commission of EEC (officials) (Common Market)	Commission of Euratom
	European Assembly	

The Parliament or Assembly consists of representatives of the national Parliaments There are 142 representatives in all—36 from each of the three bigger powers, 14 from the two medium ones, and 6 from Luxembourg. It meets once a year as of right and its only power is to pass (by a two-thirds majority) a vote of censure on the Commission (the permanent officials) which must then resign If Britain were to join its quota of members to the Assembly would presumably be 36. It is generally held that one day the Assembly will consist of representatives elected by direct universal suffrage but this will not occur until everybody is willing. In the meantime the Assembly can only consist of nominated parliamentarians.

The Working of the Organs: the Commission.—We look first at the Commission (of officials) as this is held to be by far the most powerful of the organs. Broadly speaking, it is the only body with a right of initiative, sending, as we have explained, proposals to the Council which cannot prepare its own proposals for consideration. The Commission can thus prevent the Council considering anything it does not want to be considered. Its proposals to the Council can normally be amended by the Council only by unanimous or qualified majority vote.

The Commission prepares the budget, takes member Governments into Court, runs the agricultural market and is the Monopoly and Restrictive Practices Court.

In addition to all this the Commission has its own powers as we have explained under heading (b) in the earlier paragraph about the Commission. By its *decisions* it can give orders to member States over a wide field. For example, it can give orders on the details of applying rules of free competition to nationalised industries or to industries with special rights. Its *directives* order the result to be achieved (for example the framework within which agricultural prices are to be negotiated). It gives (or refuses) *authorisations* over a wide range of subjects, like the postponement of the raising or lowering of a tariff in certain circumstances. The powers of the Commission are thus seen to be extensive and important and they affect, among many other matters, the running of nationalised industries and the uses of Government aid.

The Powers of the Commission contrasted with the Council.—That the Commission (of officials or "Eurocrats" as they have been called) are the real rulers of the Community is more clearly seen when that body is contrasted with the Council (of politicians), quite apart from the range and importance of the powers given to the Commission. The Commission decides by simple majority and can easily reach a decision, but the Council, which requires either unanimity or qualified majority, is often unable to make a decision. The Commission has almost all the right of initiative. It sits for a minimum of four years, while Council members come and go. The Commission meets as often as it wishes, the Council once a month. The Commission thus acquires a real personality but not the Council. It is furthermore the Commission which controls the Community Civil Service.

Is the Commission democratic?—As we have seen the Commission is literally a bureaucracy, exercising many of the powers of government, and in the view of Mr William Pickles, Senior Lecturer at the London School of Economics, "there is no body of officials in any democratic country which enjoys anything even remotely resembling such a position of power *vis-à-vis* a body of Ministers issuing from democratically elected Parliaments". In his pamphlet *Not with Europe: the political case for staying out* published by the Fabian Society (which also publishes pamphlets in favour of British membership) Mr Pickles draws a simple picture of what the equivalent of the Commission would be at home. Imagine that we have two Cabinets here, he says, each with its own powers, but the second consisting entirely of permanent officials. None of the officials would be responsible to any individual Minister, they would do many things without reference to Ministers, they, and not the Ministers, would appoint all the other officials, and it is they who would fix the agenda of the first Cabinet. The second Cabinet could not be dismissed so long as it was supported by only one third of Parliament, and neither Cabinet would be subject to any other form of Parliamentary control whatsoever.

Other Views on the Commission.—It is fair to record that the view that the Commission is more important than the Council has been disputed by Lord Gladwyn the Chairman of the Common Market Campaign. "As things are", he wrote (December 1962), the Council "is the really important and decisive body". He said that the decisions which the Commission will take are of minor importance and are in the field of broad decisions which have already been accepted by the Council. On the other hand Mr. de la Mahotière in his book *The Common Market* (Hodder & Stoughton) thinks that the Commission has acquired greater importance as the Community has developed; and that, broadly, the Commission favours a federal structure. The views of Mr. Peter Kirk, Conservative M.P. (who has been a member of the Council of Europe and Western European Union Assemblies since 1956), may be cited. Broadcasting in January 1963 he said "there is a vital need for criticism of the Commission's work . . ." This criticism and control should be the task of the Assembly but "the present Assembly is unworthy of the name of Parliament at all". The defects whereby the Assembly—the Parliament of the Community—"has virtually no power at all" seemed to Mr. Kirk to make a situation which "must be unacceptable to any believer in parliamentary democracy in this country, especially as we can look forward to a fairly steady increase in the power of the Commission, as the Treaty of Rome comes to full effect".

6. Proposals for Simplification.

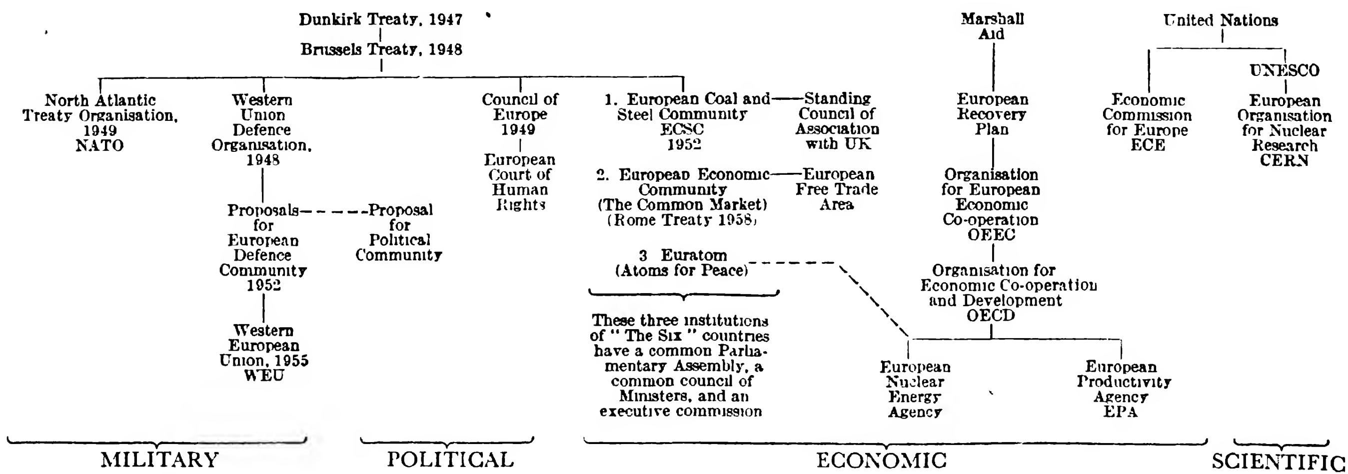
There are now in Europe almost as many "Unifying" bodies as there are countries to unite. Six major organisations, still more minor ones, and three parliamentary assemblies are all engaged on aspects of the task of building a United Europe. At least four cities, each housing one of the major organisations, can aspire (should they desire this honour) to become the "capital of Europe". There is inevitably some overlapping. Thus Western European Union and the Council of Europe are both competent for social and cultural questions. OECD and the Council are both interested in economic questions. At the moment there is not "one Europe" but the Europe of the Six (coal and steel community, common market, Euratom), another Seven in EFTA, the Seven in WEU, the Sixteen (the Council of Europe) and the Eighteen members out of the twenty in OECD.

Britain's "Grand Design."—In 1956 Great Britain suggested a single European Assembly where all aspects of Western co-operation could be reviewed. This would have the merit of concentrating in a single place organisations whose centres are at present in various capitals. This European Assembly would have five Commissions, political, economic, social and cultural, legal, and administrative. The "Grand Design" suggests more effective political consultation in NATO and WEU, and it further suggests the better linking of European unity in an Atlantic community. But the Assembly would need to cover in some way organisations of differing concepts and differing membership. This central difficulty has been faced by a proposal for two Assemblies to take, respectively, the intergovernmental and the supranational institutions—the Council of Europe, WEU being in the former category (and OEEC when it existed) and the institutions of the Six in the other. Another difficulty is that some countries are ready to join other countries in economic matters but not in military.

Other Proposals.—Another proposal was to link OEEC (which had no Assembly) with the Council of Europe (which is primarily an Assembly). In a similar way a fusion has been suggested of NATO and WEU to form a general defence assembly. This proposal was advocated in an excellent pamphlet published by PEP (Political and Economic Planning) in 1957.

The Special Position of Great Britain.—This country, although a European country, is in a special position, being already in two other orbits. She belongs to the British Commonwealth, and half her trade is with the Commonwealth, a quarter being with Europe. She also has strong links with the U S A. For these reasons this country has been unwilling to join in supranational organisations. An exception in practice has been the transfer of the command of Britain's national forces to the NATO supreme commander.

GROWTH OF WESTERN EUROPEAN ORGANISATIONS



Some Proposals for simplification of European bodies are noted below When the proposals were made the OEEC had not yet been replaced by OECD, which includes Canada and the U S.A.

1. Proposal for a single European Assembly with five Commissions, in a " Grand Design " Proposal made by United Kingdom in 1956
2. Proposal for two Assemblies to take respectively the intergovernmental and the supranational institutions. The Council of Europe and WEU are in the former class, and ECSC and other institutions of the six countries concerned are in the latter class. OEEC was in the former class.
3. Proposal to link OEEC (which had no Assembly) with the Council of Europe (which is primarily an Assembly); to make OEEC the Economic Assembly of Western Europe and to fuse NATO and WEU in a general Defence Assembly.
4. Proposal to merge the defence functions of WEU with NATO and its other functions with the Council of Europe, then to merge the Council of Europe with OEEC to create a " European Union " for Greater Europe (Mr Kenneth Lindsay)

MEMBERSHIP OF EUROPEAN ORGANISATIONS

(M is full membership, AM associate membership)

	Military		Economic				
	NATO	WEU	Council of Europe	OECD	ECSC Euratom, and EEC.	EFTA	ECE
Belgium (Benelux)	M	M	M	M	M		M

Notes: All the countries are members of UNO except Western Germany and Switzerland. The U.S.S.R. and other Eastern European countries are also members of ECE

* The United Kingdom is associated with ECSC through a Standing Council of Association.
† At February 1963 the only associate member of EEC was Greece, which had accepted the European common external tariff, although the Six had decided to conclude a similar agreement with Turkey. Other requests for association had been made by Sweden, Austria, Switzerland, Portugal, and Spain.

BERLIN.

The Facts.—The commitment to Berlin by the Western Powers is expressed in a Four-Power agreement. In 1944 the Russian, United States and British members of the European Advisory Commission (France adhered to the agreement later) agreed to divide Germany into occupation zones. This followed the defeat of Germany. They also agreed that the Berlin area would be administered separately as a fifth portion of Germany and be divided into sectors. This formally established the Western Powers' right to have their forces in what has since become West Berlin. This right carried with it the right of access by the Western Powers to their sectors in Berlin, and this was reaffirmed by the four Powers in June 1949. In October 1954 the Western Powers made a formal pledge to the people of West Berlin reaffirming their intention to keep armed forces in Berlin and that they would treat any attack on Berlin as an attack on themselves.

The Potsdam Agreement of August 1945 did not deal with rights but in essence laid down that Germany was to be treated as an economic unit and that Germany should not be dismembered politically. The Potsdam Agreement has become a dead letter by the creation of a Communist régime in the Russian zone of Germany; but this does not entail the cancellation of the rights of the Western Powers under the agreement described in the preceding paragraph.

What Mr. Khrushchev Wants.—Soviet proposals have been made many times for a German peace treaty to be signed with a confederation of the two German States, and for a Free City of West Berlin. Failing an all-German peace treaty Russia said she would sign one with the East German Republic. Thereafter countries wishing to maintain ties with West Berlin would have to agree with the East German Republic on means of access.

Western proposals are that German reunification should take place on the basis of self determination by all Germans through free elections; and that an all-German government should negotiate a final peace treaty. This carries with it the view that the whole city of Berlin (i.e. including East Berlin) should be reunified within the context of the proposals for reunifying Germany. But Russia refuses to contemplate a Germany reunited in this way since there would be no Communist influence to counter the danger which they feel of renewed German aggression. They also ask for formal recognition of the Oder–Neisse frontier line to the east of Germany.

Russian proposals are that the two German states should be persuaded to form a voluntary confederation on equal terms and a peace treaty should be signed with the confederation. Failing agreement between the two to confederate a peace treaty should be signed with one or both. The German States could remain "for a certain period" members of NATO and the Warsaw Pact respectively. But the Western Powers object that the four Powers cannot divest themselves of the responsibility for reunification. The East German régime has not been properly elected and a federation would preserve the division of Germany. On Berlin the Russians propose that West Berlin be converted into a neutral demilitarised Free City with token troops, including Russian. The changed status of West Berlin would need to have regard to the sovereign rights of the East German Republic and this would mean the ending of the occupation régime of West Berlin. In other words control over communications to West Berlin would pass to the East German Republic. The West object that West Berlin is already a Free City, and that a free city of Berlin should embrace East Berlin, illegally detached from four-Power administration under agreements which Russia signed.

A LIST OF SOCIETIES.

On this page are the addresses of some of the societies working in the fields of social service and international affairs. They are only a selection from all the societies working in these and allied spheres. Many societies working in the fields of adult education and outdoor and cultural pursuits are described (with their addresses) in the Section "Leisure Activities"

What the Societies Offer.—Many of the societies offer the facility of a unique specialised library, and most of them issue not only journals and magazines but pamphlets giving the latest authoritative views and discussions of contemporary problems Besides these facilities the associations offer the individual the opportunity of hearing experts and of discussing the subject with others interested in the same subject Many societies hold not only lectures but conferences, covering the week-end or several days, and some of them hold Summer Schools

Social Service.

The National Council of Social Service (26 Bedford Square, London, W.C 1) is the main promotional and co-ordinating organisation of voluntary social work in Great Britain It publishes *Handbooks on Voluntary and Public Social Services and Directory of Organisations*

The Annual Charities Register and Digest is a famous reference book prepared by the Family Welfare Association (address below) It is a standard guide to every branch of charitable work, giving details of Adoption Societies, Almshouses, Homes for Incurables, Convalescent Homes of all kinds, and all Welfare Institutions.

Some useful addresses are —

British Association of Residential Settlements,
Bishop Creighton House, 378 Lillie Rd, S W.7.
Central Council for Health Education,
Tavistock House, Tavistock Square, W C 1.
Citizen's Advice Bureaux Service,
26 Bedford Square, W.C 1.
Family Planning Association,
231 Tottenham Court Rd, W.1
Family Welfare Association,
296 Vauxhall Bridge Rd, S W 1
Industrial Welfare Society,
48 Bryanston Square, W 1.
Institute for the Study and Treatment of Delinquency,
8 Bourdon St, Davies St, W 1
National Association of Parish Councils,
26 Bedford Square, W C.1
National Association of Boys' Clubs,
17 Bedford Square, W C.1
Scottish Association of Boys' Clubs,
12 Alva St, Edinburgh, 2.
National Association of Youth Clubs,
30–2 Devonshire St., W.1
Scottish Association of Girls' Clubs,
13 Eglington Crescent, Edinburgh, 12
National Council of Women,
36 Lower Sloane St., S W.1.
National Council of Y.M C A 's,
112 Great Russell St, W C 1.
10 Palmerston Place, Edinburgh, 12
22 Howard St, Belfast
National Federation of Community Associations,
26 Bedford Square, W.C.1.
National Federation of Women's Institutes,
39 Eccleston St, S W 1.
Federation of Women's Institutes of Northern Ireland,
28 Bedford St., Belfast
National Federation of Young Farmers' Clubs,
55 Gower St., W C 1.
National Marriage Guidance Council,
58 Queen Anne St, Grosvenor Square, W.1.
National Union of Townswomen's Guilds,
2 Cromwell Place, S.W.7.
Save the Children Fund,
12 Upper Belgrave St., W.1
Scottish Council of Social Service,
10 Alva St., Edinburgh, 2.
Northern Ireland Council of Social Service,
28 Bedford St., Belfast.
Tavistock Institute of Human Relations,
3 Devonshire St, W 1
Young Women's Christian Association,
108 Baker St, W 1.
18 Atholl Crescent, Edinburgh, 3.
385 Malone Rd., Belfast

International Co-operation.

The National Peace Council (29 Great James St., W C 1), is a federation of national societies concerned in the promotion of peace It publishes the *Peace Year Book*, which contains a directory of societies working for peace

Useful addresses —

United Nations Association,
25 Charles St., W.1
Union of Democratic Control,
13 Prince of Wales Terrace, W 8
Federal Union,
10 Wyndham Place, W.1.
Women's International League for Peace and Freedom,
29 Great James St, W C 1
International Voluntary Service,
72 Oakley Square, N W 1
British Society for International Understanding,
Benjamin Franklin House, 36 Craven St, W.C 2
International Friendship League,
Peace Haven, Creswick Rd, W 3.
Friends Peace Committee,
Friends House, Euston Road, N W 1
Africa Bureau, The,
65 Denison House, Vauxhall Bridge Rd, S W 1
United Kingdom Council of the European Movement,
38 Parliament St, S W 1.
Fabian International Bureau,
11 Dartmouth St, S W.1
English Speaking Union,
37 Charles St, W 1
Council for Education in World Citizenship,
25 Charles St, W 1
Royal Institute of International Affairs,
Chatham House, 10 St James's Square, S W 1.
Parliamentary Group for World Government,
House of Commons, S W.1
Fellowship of Reconciliation,
9 Coomb Rd, New Malden, Surrey
Campaign for Nuclear Disarmament,
2 Carthusian St, E C 1
War on Want,
9 Madeley Rd, W 5
Institute of Race Relations,
36 Jermyn St, S W 1
United World Trust,
29 Great James St, W C 1
Oxford Committee for Famine Relief,
274 Banbury Rd, Oxford
British Council of Churches,
10 Eaton Gate, S W 1

Some Other Societies.

Political and Economic Planning,
16 Queen Anne's Gate, S.W 1.
Howard League for Penal Reform,
Parliament Mansions, Abbey Orchard St., S.W.1.
Progressive League,
20 Buckingham St, W C 2
Ethical Union,
13 Prince of Wales Terrace, W.8.
Electoral Reform Society,
Albany Institute, Creek Rd., S E.8
Women's Co-operative Guild,
348 Grays Inn Rd, W.C.1

(*Note* Unless otherwise stated the above addresses are in London, and this is further indicated by the postal number, *e.g.*, S.W.1. Correspondents writing from places other than London should include "London," as well as the postal number, in the address.)

The Law of England

A Concise Survey of the English Legal System, its history and development from early times, with further detail of some particular branches of the law which are of practical interest to the ordinary citizen.

TABLE OF CONTENTS

THE LAW OF ENGLAND

A.—The Sources

Comprising

COMMON LAW — CASE LAW — EQUITY * — STATUTE LAW

B.—The Sub-divisions

I. Constitutional Law.	II. Criminal Law, dealing with the relations between the individual and the State	III. Status.	IV. Law of Persons,* dealing with the relations between one individual citizen and another, established—		V. Law of Property.*		
Main Principles· 1. The Supremacy of Parliament. 2. The Rule of Law. (a) *The Legislature:* The franchise, elections, Parliamentary procedure, relations between Lords and Commons, Bills and Acts. (b) *The Executive:* The Crown, the Ministry, Government Departments and their powers. (c) *The Judiciary:* The Courts and their functions, the Judges, means of controlling the Executive and inferior courts. (d) *Local Government:* County, Borough, Urban and Rural District and Parish Councils and their powers. (For further details, see Section C.)	A. Grave offences against— 1. *Public Order*· Treason, sedition, riot, blasphemy, obscenity, forgery, bigamy, perjury. 2. *Persons:* Homicide, assault, sexual offences. 3 *Property*· Larceny, burglary, housebreaking, false pretences, blackmail. Subsidiary matters: (a) Criminal responsibility. (b) Unconsummated Crimes. (c) Joint Crimes. (d) Punishment and its purpose. B. *Petty Offences, e.g.*, Road Traffic, Factories and Shops, Sale of Food, etc.	1. Nationality. 2. Domicil. 3. Marriage and Divorce. 4. Infancy. 5. Lunacy. 6. Bankruptcy. 7. Corporations.	1. *By act of parties (Law of Contract):* (1) Simple Contracts. (2) Deeds· (a) Capacity of parties. (b) When writing necessary. (c) Mistake (d) Misrepresentation. (e) Duress and undue influence. (f) Illegality. (g) Breach	2. *By Law (Law of Tort):* Civil Wrongs committed against— (1) *The Person:* Trespass, assault, malicious prosecution, and false imprisonment. (2) *Land:* Trespass, Nuisance. (3) *Other Property:* Trespass, Conversion. (4) *Persons towards whom there is a duty to take care:* Negligence. (5) *Reputation:* Defamation (libel or slander). (6) *Personal and Trade Relationships:* Seduction, enticement, trade molestation *and*— (a) *Liability.* (b) *Immunity.* (c) *Effect of Death.* (d) *Remedies.*	In General: 1. *Living Persons:* (Effect of Status on Ownership). 2. *Deceased Persons:* (Wills and Intestacies, Probate and Administration).	In Land (Immoveable Property): 1. Freeholds (Settlements) 2 Leaseholds. 3. Mortgages. 4. Title. 5. Joint Ownership.	In Other Property (Moveable Property): 1. Chattels. 2. Things in action.

* *Note:* Equity is applied only in matters of civil law relating to persons and property. It has no application to constitutional or criminal law.

D3

The Law of England

THE Table set out on D3 shows in concise form—

A—the sources, and
B—the subdivisions

of the Law of England. The intention is to give a general picture of the whole system in tabular form, to explain briefly what the Table represents, and finally to deal, in slightly more detail, with a few selected subjects which may be of particular interest to the ordinary reader

A word of warning is necessary. Learned te t-books have been written on every one of the many subjects referred to in the Table, and the application of the law in any particular case is a matter for the professional expert. The following pages do not claim to do more than to make a brief survey of the whole field of English Law, for the general guidance and interest of the ordinary citizen.

A. THE SOURCES OF ENGLISH LAW

The citizen who desires to make some acquaintance with the English Legal System must begin by disabusing himself of several popular fallacies, for example, that it is a fixed and unalterable code, that it is strictly logical, that it is coldly impersonal and uninfluenced by human factors The history and practice of the law display precisely the opposite characteristics.

1. COMMON LAW AND CASE LAW

The English Legal System is a *living organism*, not a dead, static code. The system as we know it began to develop in the thirteenth century, when Henry II extended the practice of sending the royal judges about the country " on circuit," to deal with crimes and disputes, and to adapt and give official authority to the best of the local customs, some of which had been in force since Anglo-Saxon days. The judges did this by *empirical methods*—that is, by practical, common-sense decisions on the actual cases brought before them, and by setting out their reasoning in detail Simple records of the most important decisions were kept from the earliest times; as the centuries passed, the gradual elaboration of a system of *law-reporting* ensured that the *facts* of significant cases, the *reasoned judgments* delivered on those facts, and the *principles* those judgments enshrined, should be recorded and preserved; at the same time the doctrine of *precedent*—the rule that those principles, enunciated by a superior court, should be followed by all courts inferior to it—ensured consistency throughout the country Thus there was gradually developed a body of principles—living, growing, and adaptable to new sets of facts as they arose; principles, moreover, which rose above local differences of custom and became *common* to the whole Realm. Hence the expression *common law*.

Case Law. The system we have described is by no means a thing of the past it is still in force today. New circumstances are continually arising; cases come before the judges for decision, and it frequently happens that the principles laid down in the past do not apply precisely, in all respects, to the particular facts in point. When this occurs it is the judge's right and duty to *interpret and adapt the principle to the new facts* before him; his judgment is reported, and his reasoning made clear. The adapted principle of that judgment becomes part of the law of England; it must be followed by all inferior courts, and it will not be ignored or abandoned by courts of the same rank, or any superior court, without reasoned argument and careful consideration. Thus the practising lawyer can never sit back with the comfortable assurance that he has " completed " his studies, he must continually keep his knowledge up to date. The practice of law is not a science, based on rigid rules, but an art—the art of *applying the known principles to the facts of new cases* as they arise.

2. EQUITY

But the English genius for practical improvisation has never excluded spiritual and *ethical motives* of conduct. For hundreds of years the Church was a great power in the land, extending its influence far beyond the strictly ecclesiastical sphere. The great church-leaders of the past took an important part in the secular activities of government and administration, from an early date the King's Chancellor was an ecclesiastic. The Chancellor was not only the King's Secretary of State and Keeper of the royal seal; as royal chaplain he was " the Keeper of the King's conscience." It was to him, therefore, that the King turned for advice on matters of state where *ethical and moral considerations* were involved.

All human institutions are fallible, and the rough-and-ready methods of the early common law sometimes fell short of those ideals of abstract justice that inspire men's minds. Despite, or perhaps because of, its practical outlook, the common law tended to become circumscribed by its own precedents. As the machinery of justice became more elaborately organised, the idealistic doctrine—" Where there is a right there is a remedy "—was apt to degenerate, in practice, into the realistic but soulless form—" Where there is a legal remedy, there is a legal right." Too close an adherence to legal formalities led sometimes to a denial of justice. This was particularly so for the weak, who could not help themselves—feeble-minded persons, tricked or cajoled into " legally " signing away their property; infants unconscionably treated by guardians who, having got legal custody (under a will or otherwise) of the infants' inheritance, refused to honour their solemn trust; borrowers who, having delayed beyond the date fixed for the repayment of a loan, found themselves deprived, under the strict terms of the mortgage deed, of property many times more valuable which they had pledged only as security. For such cases as these the common-law courts

provided no remedy, since the victims had suffered *no actual illegality*. Petitions were therefore sent to the King, "the father of his people," begging him to right such wrongs; and the question of redress was delegated by the King to his Chancellor. The Chancellor had no power directly to revoke or interfere with the decisions of the royal judges by depriving the oppressive party of the property he had "legally" acquired, but he could, and did, insist that that party should not enjoy such acquisition, *unconscionably*, for his own sole advantage. The defaulting guardian, though he continued legally to hold the infants' property, was compelled to use it for the infants' benefit, the oppressive creditor, who had legally got possession of or sold the debtor's estate, was permitted to take out of the proceeds the amount of his loan, with reasonable interest and expenses, but must hand back the balance to the debtor. Thus the Chancellor administered a kind of *abstract justice*, based upon the promptings of conscience, and not on legalistic rules. He dealt with these cases in his own court—the Chancellery or *Chancery*—where the yardstick was *equity*—that which was right or fair. And over the centuries the principles on which the Court of Chancery acted became crystallised into a set of rules which followed their own precedents and made *conscientious conduct* their guiding star.

Naturally enough, the activities of the Court of Chancery were viewed with jealousy and misgiving by the royal judges of the Common Law Courts, and many were the clashes between the two. Equity, however, had come to stay, and the two systems were administered independently until as late as 1873. In that year Parliament passed the Supreme Court of Judicature Act, which (in effect) fused the two systems into one. By means of that and subsequent legislation there was constituted *one High Court of Justice*, of which the *Queen's Bench Division*, the *Chancery Division*, and the *Probate, Divorce* and *Admiralty Division* are component parts. The first-named is concerned primarily with common-law suits, the second with equitable matters, but both these Divisions must have regard to *both common law and equitable principles*. In case of a conflict of principles, those of equity are to prevail. The last-named Division (for historical reasons) deals with the diverse subjects of wills and intestacies, matrimonial suits, and disputes relating to ships at sea. Criminal cases fall within the jurisdiction of the Queen's Bench Division, but are dealt with in special courts. The criminal law (in strict fairness to accused persons) must be absolutely certain and clearly defined; it is administered on strict legalistic principles, from which the doctrines of equity are excluded. (For further details of the Courts and their functions, see Section C.)

3. STATUTE LAW

While, as we have shown, the Courts have the function of *interpreting and adapting* the principles of law laid down in earlier times, they cannot legislate—*i.e., the Judge cannot make new laws*, or repeal or amend old laws, even when changes are rendered desirable by developing social conditions. The law-making body, or *Legislature*, is *Parliament*. A *Statute* or *Act of Parliament* is the joint act of the Queen, the House of Lords, and the House of Commons, while each of these three "Estates of the Realm" has its own functions, new law can be made, and old law repealed, only by these three Estates acting together, *i.e.*, by *Parliament*, or by some person or body of persons to whom Parliament has *delegated authority* to make *rules having the force of law*. Parliament is free of control by any written constitution or any person or body of persons whatsoever, an Act of Parliament must be enforced by all courts as the law of the land, unless and until it is repealed or amended by Parliament itself. Parliament is not bound by the Acts of a previous parliament, which it is free to repeal or amend as occasion may require. It is equally free to modify the rules of the common law and the rules of equity, however firmly entrenched, but those rules, unless and until modified by parliamentary legislation, continue to guide the Judges both in their interpretation and enforcement of *Statute Law*—*i.e.*, the body of Acts of Parliament still in force for the time being—and in their decisions on those common-law and equitable rules which the Statute Law has left untouched.

THE ENGLISH LEGAL SYSTEM

These three main streams—*common law* (and *case law*), *equity*, and *statute law*—have flowed throughout the centuries, sometimes independently and sometimes in conjunction, to feed the waters of that great river which is the *English Legal System*.

B. THE SUBDIVISIONS OF ENGLISH LAW

I. CONSTITUTIONAL LAW

This is that part of the English Legal System which relates to four main branches of national administration.—

(a) *The Legislature*—*i.e.*, the *law-making* body known as Parliament.

(b) *The Executive*—*i.e.*, the *Government* and the functions of its various components.

(c) *The Judiciary*—*i.e.*, the *Judges*, their *Courts* and powers.

(d) *Local Government*—*i.e.*, the *Local Authorities* and their powers.

The two main principles of the Constitution are.—

1. The Supremacy of Parliament.—*I.e.*, there is nothing that Parliament cannot lawfully do, and there is no person or body of persons above Parliament. Its Acts cannot be unconstitutional, since it can itself modify the Constitution at will. Its Acts for the time being in force are the law of the land, and nobody can question their validity.

2. The Rule of Law.—This means that no person or body of persons is above the law of the land, and that there is one system of law, and one system alone, for everybody. There is not in England, as there is in some other states, a special system of law and special courts for scrutinising the acts of ministers, civil servants, or other functionaries; such persons are bound by the same rules of conduct as other citizens. A complaint by a private citizen against a Secretary of State or a Commissioner of Police is investigated by the same courts, and under the same legal rules, as a complaint against another private citizen. Any apparent exception will be found to result from some special provision in an Act of Parliament itself. For example, the Army Act sets up a code of conduct for officers and soldiers, and does not apply to civilians, but that code is part of the Law of England because it is contained in an Act of Parliament—a code which (incidentally) remains valid only if it is confirmed by Parliament in every successive year. Again, the Emergency Powers (Defence) Act, 1939, conferred upon the Crown and its Ministers extensive powers, during the last War, to make Defence Regulations which should have the force of law; but the Act itself had to be passed by Parliament with the proper formalities. Such Regulations derive their legal and binding effect solely from the

powers delegated by Parliament; and the High Court of Justice is competent to scrutinise, and frequently does scrutinise, the wording of the Regulations and the manner in which those powers are exercised, and to satisfy itself that the Minister concerned is not attempting to exceed the authority which Parliament has vested in him—in other words, to protect the citizen against the *arbitrary abuse of lawful powers* and against their *unlawful enlargement*. *Delegated legislation* is always subject to such control; parliamentary legislation is not, since *nobody can question the validity of an Act of Parliament*. But the *interpretation* of any Act of Parliament—the ascertainment of its legal meaning and effect—is one of the proper functions of the Courts.

(A detailed explanation of the working of the four bodies above mentioned will be found in A CITIZEN'S GUIDE.)

II. CRIMINAL LAW

This is that part of the English Legal System which deals with the relations between the individual citizen and society as a whole. Thus, if A murders or robs B, the question of redress is not one merely for B or his family; the victim cannot, in a civilised community, be permitted " to take the law into his own hands," nor can it be left to him to decide what action should be taken against the offender—otherwise blood-feuds and public disorder would result. For that reason it has been the law for centuries past that, in the case of offences (1) against public order, (2) against the person and (3) against property, *the State (representing society as a whole) itself intervenes* and *prosecutes* the offender, for the purpose of upholding public order and vindicating the rule of law by inflicting *punishment* upon him—*not* for the purpose of *compensating* the injured party (which, as will be seen below, is the contrasting function of *Civil Law*). For offences against public order, see D35–36.

The two main categories of Crime (as the Table shows) are :—

(a) *Grave (or Indictable) Offences*, which are dealt with at Assizes, the Central Criminal Court, and Quarter Sessions, and which carry severe penalties—death or lengthy sentences of imprisonment, and

(b) *Petty Offences*, which are dealt with in *Magistrates' Courts*, and are punishable by light sentences of imprisonment or by fines (with short sentences in the alternative). Examples of this latter class are (*e.g.*, under the Road Traffic Acts) driving without due care and attention, exceeding the speed-limit, causing an obstruction, etc.

Examples of (a) *Grave (or Indictable) Offences* are set out in the Table under the three main headings of:—

(1) *Offences against Public Order*,

(2) *Offences against the Person*; and

(3) *Offences against Property*.

In connection with all these categories of offences the *Criminal Law* is concerned with the following general considerations:—

(a) **Criminal Responsibility.**—*I.e.*, the primary principles that every person is presumed (until the contrary is proved) to be sane and " to intend the natural consequence of his acts," provided that those acts themselves are *voluntary* (*i.e.*, *intentional*) on his part. It would, for example, be absurd for a man, accused of wounding another person by shooting, to plead that he did not intend, when he discharged the firearm at the other person, to do him any bodily harm. On the other hand, it would be outrageous to convict and punish a child of four who, without understanding the wrongfulness of his behaviour, picked up and took away some attractive and valuable object from a shop-counter; a lunatic who killed somebody under an insane delusion that the victim was a wild beast; a boy (like Oliver Twist) who was compelled, by force or violent threats, to break into a house, or a man who took an overcoat from a public cloakroom, honestly but mistakenly believing it to be his own. In none of these last illustrations is the act a *voluntary* one in the sense that there was the *intention to do something wrong*. To the rule that an act is not a crime unless it is intentional in this sense there are a few rare exceptions—cases where an Act of Parliament has expressly and clearly made some form of *conduct punishable in itself*, whether it was intentional or not, for example, during the War, permitting a light to be visible in black-out hours was punishable, even if it was unintentional and involuntary on the part of the accused.

Intention must not be confused with *motive*. For example, in what has become known as " mercy-killing "—*i.e.*, taking the life of a person suffering from a painful and incurable disease—the killer is often actuated by a good *motive*—the desire to relieve hopeless suffering; but the *intention* is to kill, and the act is therefore a crime. (It is not necessary for the prosecution to prove any motive.)

The *burden of proof* in criminal cases is on the prosecution, *i.e.*, it is the duty of the prosecution to prove the accused guilty, not the duty of the accused to prove his innocence. The accused is presumed to be innocent unless and until his guilt is proved to the reasonable satisfaction of a jury. The jury are the sole judges of the true facts of the case, and their verdict must be unanimous.

(*b*) **Unconsummated Crimes.**—*I.e.*, *attempts* to commit crimes which are frustrated by some outside event or by some person's intervention. For obvious reasons the *attempt* to commit a grave crime is *itself an offence* for which the offender can be prosecuted and, if convicted of the attempt, punished by fine or imprisonment. *Incitement*, by one person, of another to commit a crime, and *conspiracy* between two or more persons to commit a crime, are usually offences in themselves whether the incitement or the conspiracy proves successful or not.

(*c*) **Joint Crimes** are those in which two or more persons take part. Such participation may arise in different ways. A *principal in the first degree* is the man who commits the actual offence with *guilty intention* (see (*a*) above), or who induces its commission by some other person who himself does not understand what he is doing. A *principal in the second degree* is one who *aids and abets* the guilty perpetrator at the time when the crime is committed. An *accessory before the fact* is one who *instigates* or *helps to prepare* the commission of the crime by another person, though not himself present when that other person commits it. In most cases of *grave crime* all these *three classes of participants* in a crime are *equally guilty*, and liable to the same punishment, provided that all of them shared the same *common criminal purpose*. (Thus, if two armed burglars break into a house, with their weapons drawn, and one of them shoots and kills the householder, both will be guilty of murder, while the accomplice who helped to plan the burglary will be equally guilty if the plan included the carrying of loaded weapons.) An *accessory after the fact* is one who, knowing that a *felony* (generally speaking, a grave crime involving *violence*) has been committed, shelters or receives one of the participators to enable him to elude justice. This latter kind of accessory is liable to prosecution, but the penalty in his case is less severe than that imposed upon any of the other three classes.

(*d*) **Punishment and its Purpose.**—The purpose of punishment is fourfold:—

(i) *Retribution*—to demonstrate to the community in general that crime " does not

pay" and thus to uphold the rule of law and to prevent the deterioration of public morals;

(ii) *Prevention*—to restrain offenders, so far as possible, from repeating their crimes by keeping them in custody;

(iii) *Reformation*—to make them, so far as possible, better citizens by means of moral and ethical training—teaching them to "go straight"; and

(iv) *Deterrence*—to inspire among offenders and would-be offenders a fear of and a healthy respect for the law and the strength of society as a whole, which it protects.

There has been much controversy on the relative importance of these four functions of punishment. Until comparatively recent times *deterrence* was considered the primary function, and punishments were correspondingly severe and, by modern standards, savage. Experience has shown, however, that *crime is not effectively reduced* merely by *severity* of punishment, but rather by the *certainty or probability of detection* and conviction. (See reference to the 1959 White Paper, D33–4). And, particularly during the past half-century, *reformation* of the offender, whenever possible, has become a paramount aim, not only on grounds of humanity, but also for the purpose of reducing the wastage of human material which can frequently be salved from a life of crime if it is taken in hand, firmly but kindly, at an early stage. (See, for example, the sections headed *Juvenile Courts* and *Probation Officers* in A CITIZEN'S GUIDE).

III. STATUS

A person's *Status*—*i.e.*, his legal position in society—affects his legal rights and duties in most civil matters and, in some few cases, in criminal matters too (see under *Criminal Responsibility*, D6).

1. Nationality, in this connection, means British Nationality under the British Nationality Acts, the latest of which was passed in 1948. Under that Act the term "Commonwealth Citizen" was created which can be used as an alternative to British Subject. A person may be a British subject by birth, by naturalisation, or by marriage, though under the Act of 1948 a woman who was not a British subject before marriage does not automatically acquire British nationality merely by reason of her marriage to a British subject. The law and the courts of this country can determine whether a person is a *British subject* or an *alien*, they cannot determine whether or not he is a citizen of some particular *foreign state*, since that is a matter for the law of the foreign state concerned. Generally speaking, in times of peace, an *alien* in this country has the same rights and duties as a British subject, except that an *alien* has *no right to vote* in parliamentary or municipal elections, and that some professions (*e.g.*, that of a solicitor) are closed to him.

2. Domicil means the country where a person has his *permanent home* without any present intention of changing it. His *domicil of origin* is that of his parents while he is under twenty-one; over that age he is free to acquire a new domicil by making his permanent home elsewhere. Domicil is of particular importance in matters of—

3. Marriage and Divorce.—English law generally regards as valid a *marriage ceremony* carried out in this country after the proper preliminaries and with the proper formalities, whatever the nationality or domicil of the parties. English law also accepts the validity of a *marriage ceremony* which has been carried out abroad according to the law of the country where it took place. But if one party or the other has an *English domicil*, the *status of the marriage as an institution* must depend on English law, whether the *ceremony* was in proper form or not. For example, a man who has his permanent home in England cannot evade the English rule against consanguinity by going through a *ceremony* of marriage, in Ruritania, with his mother's sister—even if such a marriage is lawful by Ruritanian law, and even if the ceremony has been carried out with the usual Ruritanian formalities, it is still *null and void* by the law of England. The English court will *not*, generally speaking, grant a *divorce* to a man who is *domiciled abroad*, since the law of the country which is his permanent home may not recognise this divorce, or perhaps any divorce, as valid, and it is improper that he should be regarded as a single man in England and a married man in his homeland. Similarly, English law *will* generally recognise the validity of a divorce granted by the proper court of his domicil (*i.e.*, of the state where he had his permanent home at the time) or of a divorce which the law of his domicil regards as valid, even if it was granted by a court elsewhere—and that whether he is a British subject or not. But a person, whatever his nationality, whose permanent home is in England will not be regarded here as validly divorced merely because he has spent a few weeks in Barataria, where divorce procedure is simple, and has been granted a decree there. His *status*—married or single—generally *depends on the law of his domicil*—*i.e.*, the law of the country which is his permanent home. (For further detail See D24–32.)

4. Infancy is the status of a person under the age of twenty-one. An *infant cannot vote at elections*, he *cannot hold freehold or leasehold property*, and *he cannot be made bankrupt*. (In exceptional cases where the debt is for "necessaries" (D10(1)), a bankruptcy notice may be issued against an infant.) If he enters into certain kinds of *contracts* during his infancy he *can repudiate* them, if he so desires, up to a reasonable time after his twenty-first birthday. He *cannot make a valid will*, and his rights under another person's will or settlement cannot be compromised or altered without the leave of the High Court. An infant *cannot make a valid marriage without consent* of his parent or guardian, or of the appropriate court. His rights are at all times the special care of the Chancery Division of the High Court, which will protect those rights according to the Rules of Equity (see D5).

5. Lunacy, in the broad legal sense, is the status of a person who is "incapable, by reason of unsoundness of mind, of managing his affairs." "Lunacy" in this sense is not necessarily identical with any of the mental conditions to which such psychological terms as "insanity," "imbecility," "idiocy," and the like are applied, there need be no actual mental *disease*. When a person becomes incapable, for this reason, of managing his affairs, the law, in order to protect both him and society at large, *changes his status* by putting the custody of his person, or the control of his property, or both, into reliable hands. Such matters come under the supervision of the Chancery Division, since one of the functions of Equity (see above) is to protect those who cannot help themselves. Certification of "insanity" (in the psychological sense) is not necessary; but with the proper medical certificate and legal safeguards the *patient* (as he must be called) may be removed to a mental hospital. Some reliable person (usually a near relative) may be appointed, by an Order of the *Court of Protection* (a branch of the Chancery Division), as *Receiver* of his property. The Receiver's duties are to look after the property and income of the patient, pay his debts and defray the expenses of his maintenance and medical care, and generally to deal with the patient's property on the patient's behalf. Periodical accounts must be submitted to the Court, which will scrutinise them strictly and at once intervene if there appears to be any irregularity on the part of the Receiver. If there is no relative to take the responsibility, the *Official Solicitor* at the Royal Courts of Justice will be

appointed as Receiver, with the same duties and liabilities.

Apart from these matters of administration, a person of unsound mind is regarded as incapable of making a valid will, of entering into a legal agreement, or of dealing with his property. None of these transactions is valid unless the person concerned *understood the nature and effect* of what he was doing; and whether he did understand or not is a question of *evidence* in every individual case: medical and other witnesses must testify to his conduct and demeanour at the time when he entered into the transaction in question. If the Court comes to the conclusion that he was unable to understand the nature and effect of the transaction, the Court will *rescind—i.e.*, set aside or cancel—the transaction, even though it was in proper legal form.

If a person does an act which, if *voluntary or intentional*, would constitute a *crime* (see *Criminal Responsibility*, D6), and his legal advisers put forward a defence of insanity, the general rule is stricter; he can still be convicted unless he can prove, to the satisfaction of a jury, that he was "suffering from such a *defect of reason*, due to *disease of the mind*, as not to know the *nature and quality of the act* he was doing, or (if he *did* know this) not to know that what he was doing was *wrong*." Medical men, psychologists, and social reformers have long regarded this rule (which has been in force since 1843) as too severe. It is a rule applicable to *all crimes*, but the controversy has become associated in the public mind chiefly with *murder*. As a result of a long period of agitation and discussion the rule has been amended by section 2 of the Homicide Act, 1957; but *only in its application to murder cases*. It is now provided that "a person who kills (or is a party to the killing of) another shall *not* be convicted of *murder* if he was suffering from such *abnormality of mind* as substantially *impaired his mental responsibility* for his acts and omissions in doing, or being a party to, the killing." (It does not matter whether the "abnormality of mind" arises from "a condition of arrested or retarded development of mind," or from "any inherent causes," or is "induced by disease or injury.") The Act goes on to provide that a person who, under the old law, would have been convicted of murder shall instead be liable to be convicted of *manslaughter*.

6. Bankruptcy is the creation of Statute Law—there was no common law of bankruptcy. It is the status of a person (the "debtor") who is *insolvent—i.e.*, who is unable to pay his debts (exceeding £50) as they fall due. By the appropriate procedure the State takes the management of the debtor's property out of his hands and places it in the hands of the *Official Receiver*, whose duty it is to realise it and (subject to certain privileged claims) to distribute it *proportionately among his creditors*. The procedure is that one of the creditors files at the Bankruptcy Court a *bankruptcy petition*, on which the Court may make a *receiving order*, which has the effect of *transferring the legal management* of the debtor's property to the Official Receiver. That official investigates the debtor's finances and draws up an account, called a *statement of affairs*, showing the debtor's liabilities and assets. There is a *meeting of creditors* and a *public examination* of the debtor in Court, as a result of which the Court may either *discharge the receiving order* (on the debtor's showing that he can pay his debts, if he is given time, or persuade the general body of creditors to accept his proposals for a *composition* of so much in the £), or the Court may *adjudicate* the debtor a bankrupt. In the latter case it is open to the creditors either to leave the management of the debtor's property in the Official Receiver's hands or themselves to appoint a *trustee in bankruptcy* (usually an accountant) nominated by some or all of them, and that trustee takes over the management of the debtor's affairs. The debtor is bound, under penalty, to give *full information* about his affairs to the Official Receiver and the trustee in bankruptcy; he cannot, while he is a bankrupt, sit or vote in Parliament or act as a Justice of the Peace or in certain other offices. He will be committing an *offence* if he conceals any property or debt or falsifies his books of account, if he obtains property on credit or secures credit of £10 or more without disclosing his status, if he trades without such disclosure or fails to keep proper books of account, or if he leaves or attempts to leave the country, taking with him property, worth £20 or more, which ought to be divided among his creditors. It is also an offence for him to transfer property with intent to defraud any creditor, and any such transaction may be set aside by the Court.

7. A Corporation or Incorporated Body is an association of persons recognised by *Act of Parliament*, or by its *Charter*, as *one single legal entity*. It may be a *chartered* or a *statutory corporation* (*e.g.*, the British Broadcasting Corporation or the London Transport Executive), a *local authority* (*e.g.*, the London County Council or the Westminster City Council), or a *company* incorporated under the Companies Act, 1948, or one of the earlier Companies Acts. Generally speaking, a corporation of any kind has power only to do such things as it is given power to do by its Charter or by the Act of Parliament under which it was constituted; if it goes beyond that power it is behaving *ultra vires* —"beyond its powers"—and such acts on its part will be regarded by the Courts as null and void. The Court may also restrain the corporation by *injunction*—an Order forbidding it to act in such a manner.

Every corporation, being a single legal entity, is a legal *person* distinct from the individuals who are its members. Thus the *corporation itself* can take *proceedings*, or have proceedings brought against it, in the Civil Courts, and it may itself be *prosecuted* in the Criminal Courts, if it commits an offence, and be liable to a fine. No personal liability rests upon its individual members, directors, or officers unless they have personally done something unlawful or aided and abetted the corporation in its wrongdoing. The corporation itself can *enter into a legal agreement* with one or more of its members or a member of the public, and any person injured by its acts can enforce his legal rights against the property or assets of the corporation, which are distinct from the property or assets of the individuals who compose it.

A *company* is usually a commercial concern and generally takes advantage of the principle of *limited liability*, in which case the last word in its name must be the word "Limited." The principle is that, in the event of the company's becoming *insolvent*, none of its members can be compelled to contribute to its funds a larger sum than the sum which he agreed to pay for his *shares*, however large the indebtedness of the company itself. Every company must file at the Companies Registry a *Memorandum of Association*, setting out its *name*, the situation of its *registered office*, its *objects* (beyond which it has no power to act), its *capital*, and whether or not it is *limited*. It must also file its *Articles of Association*, setting out its *rules of management*, the method of issuing, allotting, and transferring its *shares*, the procedure for *meetings*, the powers and duties of its *directors* and other officers, and similar matters. If and when its objects have been *fully achieved*, or if it is desired to *discontinue its activities*, or if it becomes *insolvent*, it will be *wound up* and *dissolved*. The winding-up is undertaken by a *Liquidator* whose duties are similar to those of the trustee in bankruptcy (described above under *Bankruptcy*). The liquidator may be nominated by the members of the company or, in case of the company's insolvency, by some or all of the creditors, and the liquidator's appointment must be confirmed at a special meeting. If the winding-up of an insolvent company takes more than a year the liquidator must report annually to the *Board of Trade*, the Government Department which watches the interests of the persons concerned.

IV. The CIVIL LAW or LAW OF PERSONS

This deals with the relations between *one individual citizen and another*, and their mutual rights and duties. If A makes a business agreement with B, and breaks it, or if A walks without permission across B's field of new-mown hay, B will be able to secure *redress* against A by proceedings in a court of law. But in neither case is it necessary for the State to intervene, by way of prosecution, to punish A for what he has done, since no offence against society at large, and no violation of public order, or the rule of law, has arisen. The issue is one merely between A and B; B may choose to ignore the wrong done to him, or he may negotiate amicably with A for the payment of compensation or, if this fails, he may *as plaintiff sue A as defendant* in a *civil action* for *damages*. Unlike a criminal prosecution, undertaken by the State for the preservation of public order and vindication of the rule of law, with a view to punishing the offender, the *civil action* will be brought, if B so chooses, *by B himself* for the purpose of recovering *compensation* in money for the harm he has suffered and (in some cases) of obtaining an *injunction*—a Court Order prohibiting A from continuing his wrongful conduct. Again, a criminal prosecution will not be discontinued even at the request of the injured party, since the State itself is interested to see justice done; but a *civil action* can be *discontinued* by B at whatever stage he desires, with or without an agreement for the payment of *damages* in compensation.

These *relations between one individual and another*, interference with which may give rise to a *civil action for damages or injunction*, may arise in two alternative ways:—

(1) from the acts of the parties themselves,

(2) from the operation of law.

1. Law of Contract

The relations between individuals which arise from the acts of the parties themselves are usually brought about by a *contract—i.e.*, by an agreement between them. A contract may be (a) *expressed in words*, as where A agrees to buy B's motor-car for £400, on certain stated conditions, or (b) *implied by conduct*, as where A calls a taxi and tells the driver to take him to a certain address. (*a*) In the former case, particularly if the contract is put into writing, the parties will normally have *expressed* all the necessary terms and conditions. (*b*) In the latter case it is *implied* by A's conduct, and understood by law and custom, that A will be expected to pay, at the end of the journey, the amount of the fare recorded by the taximeter, it is not necessary for the driver to stipulate those terms in advance. Everybody, several times in the course of each day, enters into an *implied contract* of this kind —when he steps on an omnibus to go to his work, when he orders a meal in a restaurant, when he tells the grocer to deliver goods to his house, and so on.

Simple Contracts and Deeds

(1) **A Simple Contract** is a contract *expressed in words* (whether in writing or not) without the formalities of a *deed* (see below), or a contract *implied by conduct*. There is no legal contract (*a*) unless there is *complete certainty* on the terms, (*b*) unless the basis of the agreement is lawful, and (*c*) unless both parties are *legally capable* of entering into it (see above, *Status*), and (*d*) in *complete agreement* on their intentions. And the agreement is not enforceable (*e*) unless there is some *consideration*, *i.e.*, some *quid pro quo*, expressed or implied, on either side. Thus (*a*) a promise by A that he will buy B's motor-car cannot be enforced by either side unless the price is mentioned, nor (*b*) if the car has been stolen by B, nor (*c*) if A is of unsound mind, nor (*d*) if B owns two cars, and A is thinking of the Ford, while B intends to sell the Austin. Again (*e*) a promise by C, during the course of the year's work, that he will give his employee, D, a Christmas box of £5 is not enforceable by D unless *he* has made a promise, or done something in return. If C tells D that he will give D the £5 at Christmas *on condition that* D puts in certain *extra time* over and above his normal working-hours, and D complies or promises to comply, that compliance, or promise of compliance, will be sufficient *consideration* to turn A's promise into an enforceable contract. There need be nothing at all in writing, except in a few cases laid down by law; in all other cases the only *value of a written agreement*, signed by both parties, is that it provides clear *evidence* of the terms that were agreed. A written contract requires a sixpenny revenue stamp if it is to be produced as evidence in a court of law.

(2) **A Deed** (broadly speaking) is a contract or other written document, *signed*, *sealed*, and *delivered* by the parties. The formalities of *affixing one's seal* to a legal document, and pronouncing the formula, "I deliver this as my act and deed," have emphasised the significance and solemnity of certain important transactions for many centuries past; and even persons who were unable to write their names were capable of carrying out the formalities of *sealing* and *delivery*. The legal requirement that deeds should also be *signed* was imposed only in 1925, by section 73 (1) of the Law of Property Act. The chief practical distinction between a simple contract and a deed is that a *deed requires no consideration* to make it enforceable. The special formalities which constitute the *execution* of a deed (*i.e.*, signing, sealing, and delivery) take the place of that moral obligation which (in a simple contract) the common law required to be satisfied by consideration on the part of the person to whom the promise was made. For this reason a *deed* is required in a case where A makes a promise to B which he desires to render enforceable without any corresponding promise by B to A, and also in a case where A desires to make to B a *gift of property* of such a nature that it cannot be physically handed over. This second case arises particularly where the subject of the gift is *land or buildings*. In fact, by a provision of the Law of Property Act, 1925, a *deed* is always necessary to *transfer the ownership* of any *freehold or leasehold* property, and also to grant a *tenancy* for a term of *more than three years*. The transfer of a *legal right* of some kind (*e.g.*, a share in a company or the claim to moneys under an insurance policy) is effected *by deed*.

In connection with the Law of Contract the following subsidiary matters must be considered.—

Subsidiary Matters

(a) **Capacity of Parties.**—The question whether a party to a contract is *legally capable* of entering into it. This question usually depends on that party's *status* (see above).—

(1) *Nationality.*—Nothing turns on this, except that *no commercial contract* can be made with an *alien enemy* in time of war.

(2) *Domicil.*—Where the two or more parties to a contract have their *permanent homes in different countries* it is a wise precaution for them to state, in the contract, under which country's law and by which country's courts, in case of a dispute, its terms are to be construed. If they omit to do so, and some dispute is brought before the English Court, it will endeavour to decide, by considering the wording of the contract, the language in which it is written, the domicil of the parties, and the general circumstances in which the contract was made, what legal system the parties intended to apply and by what court they intended it to be judged.

(3) *Marriage and Divorce.*—There is now no practical difference in contractual capacity between single persons, married persons, and divorcees.

(4) *Infancy.*—It is not (generally speaking) impossible for a person under twenty-one to enter into a valid contract, but he will be entitled to

repudiate it at any time up to his twenty-first birthday (or a reasonable period after that) *unless* the contract is (*a*) clearly for the *infant's benefit* on the whole (*e.g.*, professional articles or an agreement for apprenticeship), or (*b*) for the provision of *necessaries*—*i.e.*, food, drink, clothing, or services which are necessary to the infant in his particular station in life. (The origin of this latter rule is probably the practical consideration that, in earlier times, few people would have taken the risk of providing an infant, on credit, with the bare necessities of life if they had been precluded from suing him for reasonable payment.)

(5) *Lunacy*.—A party to a "contract" who knows that the other party is of unsound mind will not be permitted to hold the latter to his bargain.

(6) *Bankruptcy*.—A bankrupt cannot make a valid agreement to deal with his property in a manner which contravenes the law of Bankruptcy (see above, under *Status* D8).

(7) *Corporations*.—Whether a corporation is capable of entering into a particular contract depends upon the legal powers conferred by the Charter or Act of Parliament under which it was constituted, or (if a company) by its Memorandum of Association (see above, *Status* D8). If the matter to which the contract relates is of grave importance it will usually signify its adherence to the contract by *affixing its seal* with the formalities laid down by its Rules or Articles of Association. If it is an everyday or trivial matter the corporation will normally enter into a contract through some agent (*e.g.*, its Town Clerk, Director, or Secretary, as the case may be) who is empowered to sign or speak on its behalf (see *Agency*, D11).

(*b*) **When Writing is Necessary.**—There are certain exceptions, laid down by Act of Parliament, to the rule (see D9 (1)) that a contract is enforceable even if made only by word of mouth or implied by conduct. The Statute of Frauds, 1677, provides that contracts of these exceptional kinds cannot be enforced by action in the Courts "unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised"—these last words mean an *agent* (see *Agency*, D11). It is *not necessary* that the *whole of the agreement* shall be formally set down in *writing*; but there must be a *written and signed record* of all the *essential terms*.

The most important of these exceptional cases are:—

(i) *A Guarantee*.—*I.e.*, a promise by A to B in the form—"Please lend money (or supply goods) to C, and if C does not pay you I will." A's promise by word of mouth cannot be enforced against him.

(ii) An *agreement* for the *sale or disposition of land* (*or buildings*) or of any interest in land (or buildings). We have already stated that the actual *transfer* of a *freehold or leasehold* interest must be effected by *deed* (see *Deeds*, D9) This is not the same as an *agreement to sell or dispose of* land or buildings; a *transfer* effects an *immediate change of ownership*, while an *agreement to sell* binds the party who signs it to make a transfer of ownership at some *future time*. Such an agreement need not be in the form of a deed, but its *essential terms* must be *in writing*.

(iii) An *agreement* which *cannot be carried out within one year* from the date when it was made, either because the actual carrying out of the transaction will take more than a year or because the agreement contemplates that more than a year is to elapse before the transaction is to be done. For example, A can make, by word of mouth, an agreement to employ B from month to month, or for not more than twelve months from the date of the agreement; but if he promises to employ B for three years, or for one year commencing in six months' time, B cannot enforce that promise unless the essential terms are in writing.

(iv) An *agreement in consideration of marriage*.—*e.g.*, a promise by A, to B, to give A's daughter, C, a certain dowry or income if B will marry her. (The words do *not* cover a *promise or agreement by B to marry C*, the breaking of the latter agreement —"breach of promise of marriage"—can give rise to an action for damages, by C against B, even if B has put nothing at all into writing.)

(*c*) **Mistake.**—Suppose that John Brown wants his portrait painted by a famous artist called William Brush, of whom he has heard but whom he has never met. He looks up "William Brush" in the directory and writes to him, at the address shown, offering him 100 guineas to paint the portrait. Suppose that particular "William Brush" is not the artist at all but a stockbroker of the same name. Even if that William Brush accepts Brown's offer, their apparent agreement will not constitute a valid contract, since Brown's *mistake* as to Brush's identity is so *fundamental* that it *destroys the very basis* of the agreement. Where there is a mistake of this kind, "going to the very root of the agreement," no valid contract has, in the eyes of the law, been made. In other special cases *equity* (see D4 (2)) may, on the ground of *conscience*, *relieve* one or both parties from liability under a concluded contract by *rectification* (*i.e.*, by correcting the terms they have inadvertently recorded) or by *rescission* (*i.e.*, by cancellation of the contract). It is not every mistake that will lead to these results; either the mistake must have been *fundamental* or the circumstances must have been such that it would be *unconscientious* for one party or the other to try and enforce his apparent rights.

(*d*) **Misrepresentation.**—Equity, on similar grounds, will often relieve a party from liability under a contract into which he has been induced to enter through a *representation* by the other party which is *substantially false*—*i.e.*, a statement which is misleading on some essential point. If it turns out that the *misrepresentation was deliberate*, the deceived party may in addition be entitled to claim *damages for fraud*. Whether the misrepresentation was *deliberate or innocent*, the deceived party will usually be able to have the contract *set aside*—*i.e.*, cancelled.

Suppose, for example, Jones wants to insure his life with the Markshire Insurance Company. Before issuing the policy, which is the contract between them, the Company will ask Jones—"Have you ever suffered from any serious illness?" Suppose Jones says "No," though he did in fact suffer from tuberculosis five years ago. Even if the policy contains a promise by the Company to pay Jones's widow £5000 upon Jones's death, the Company will be entitled to refuse to pay when that event happens, it has been induced to enter into the contract through Jones's misrepresentation.

(*e*) **Duress** means compulsion by *threats or force*. If a man has been compelled in this manner to put his name to a contract it is *voidable by him* at any time—*i.e.*, *he may repudiate* it on the ground of duress, and will be upheld by law in doing so. *Undue influence* means influence exerted by A upon B to such an extent that B could not have exercised any free and independent will in doing a particular act. Equity has always been jealous to protect certain classes of persons from this kind of influence; it goes so far as to *presume* that there has been undue influence where a guardian has got some benefit out of his ward, a parent from his child who is under (or only just over) twenty-one, a doctor from his patient, a solicitor from his client, or a priest from his parishioner. In most of such cases the onus is upon the person in the influential position, who has obtained the benefit, to prove that there was no undue influence; it is not for the other person to prove that his mind was wrongfully influenced by the former.

(*f*) **Illegality** of contract arises where the parties have agreed to do an act (i) forbidden by law or (ii) contrary to "public policy." (i) The former includes not only an agreement to commit a crime, but also an agreement to do an act which might be harmful to a third party and give him a right of action for breach of contract or tort. The courts will obviously not lend their assistance to a plaintiff who complains that the defendant has refused to honour his agreement to do something unlawful, whether (for example) the agreement was to burgle a house or merely to write a libellous article about another person. (ii) Even if the act agreed upon was not actually unlawful, the courts will refuse to enforce the agreement if it was to do something which is regarded as harmful to the community. It is not, for example, a crime for a man and a woman to live together without being married, nor is it even "unlawful" in the civil sense that such a way of life gives the one a right of action against the other, but no court would enforce an agreement by a woman to become a man's mistress, nor an agreement by the man to maintain her in return.

(*g*) **Breach of Contract** occurs when one of the parties breaks his promise and neglects or refuses to perform his duty under the contract. Breach by one party entitles the other party to sue for *damages*, the amount of which is usually assessed so as to compensate the latter for the *actual loss* he has suffered ("special damage") In certain cases the court may award *general damages* in addition—*e.g.*, in an action for breach of promise of marriage the jilted woman may be awarded *general damages* for the distress she has suffered, her loss of reputation, etc., as well as *special damages* to cover the amount by which she is *out-of-pocket* by reason of giving up her employment, buying a trousseau, etc.

(1) *Damages* have always been the *common-law remedy* for breach of contract. In special cases, however, equity may grant two other remedies in addition to, or in substitution for, damages, but only where equity regards damages as an insufficient compensation. These additional remedies are:—

(2) *Specific Performance.*—*I.e.*, an order, to the party in breach, *actually to carry out* what he contracted to do. In practice this remedy is confined to· (i) contracts for the sale or letting of *land or buildings*, and (ii) contracts for the sale of some *article of a special nature* which cannot be replaced by spending money in the open market —for example, the sale of an original painting by Rembrandt. The remedy of *specific performance* is *never* granted to enforce a contract for *personal services*, since it would be impossible for the court to supervise the carrying out of such a contract.

(3) *Injunction.*—*I.e.*, an order by the court to the party in default *prohibiting him* from carrying out some positive act which would constitute a breach of contract. For example, where a singer has entered into a contract to work, for a certain period, only under the management of one particular impresario and no other, the court may order the singer not to offer or engage her services elsewhere during that period. Disobedience to an injunction constitutes *contempt of court*, and is punishable by fine or imprisonment.

Agency

(1) **The Status of an Agent.**—An *agent* is a person, who, being duly authorised, *acts on behalf of another person* who is called the *principal*. An agent is not the servant or employee of his principal. The principal tells his agent what transactions he wishes the agent to carry out, but does not exercise the control and supervision that a master exercises over his servant. Thus, for example, a solicitor is the *agent* of the client who has instructed him to attend to the purchase of a house, once instructions have been given it is left to the solicitor to carry out the work in his own way, as his skill and knowledge dictate. But the solicitor's clerk is the solicitor's *servant*; he is told what letters to write, what documents to prepare, what inquiries to make, and so forth. The two functions may sometimes appear to overlap; but the essence of agency is that there must be a *third party* with whom the principal is to be brought into relations; "the agent is the conduit-pipe connecting the principal and the third party." The agent is therefore debarred from acting for his *own benefit* without the principal's knowledge and consent.

Generally speaking, any person may do through an agent whatever he has power to do himself, except such transactions as depend upon some *personal qualification* peculiar to his own trade or profession. Thus, a man whose business is to sell or buy ordinary commercial articles can properly leave such business to an agent to perform, but an engineer, a lawyer, or a surgeon cannot entrust an agent with work that requires the exercise of *personal qualifications*, calling for special training and skill.

(2) **The Contract of Agency.**—Agency is brought about by *contract*—an agreement in writing, by word of mouth, or even one that may be implied from the conduct of the parties. No formal words are necessary a request to an estate-agent to find a purchaser for your house will make him your agent for that purpose; if you ask a dealer to obtain for you a rare book or a Sheraton table, he is a purchasing agent on your behalf. The *terms* of the contract between the principal and the agent may be agreed upon in detail between them, or may depend upon the *usage* or general practice in the particular trade or profession. The parties are generally at liberty to agree upon whatever terms they please; in commercial agencies it is always desirable to set down in writing, for record purposes, the period for which the agency is to last, the area and scope of the agent's duties, his method of remuneration (usually by *commission*, at so much *per cent.* of the value of business he does), the prices at which he is empowered to sell or buy, and whether he is to be entitled to commission on sales to customers, or purchases from vendors, not introduced by him but carrying on business within his area.

In agencies of a special kind—where, for instance, a solicitor is instructed—his charges are regulated by a professional scale laid down by law; an estate-agent usually stipulates for payment of his commission on the recognised scale. Where no rate of remuneration has been agreed or implied, and after the work is done the parties cannot come to terms, the question must be decided by a court or arbitrator on the basis of *quantum meruit*—that is to say, an estimate of the *reasonable value* of his work.

(3) **Rights and Duties of Principal and Agent.**—These depend on the terms agreed between them; but if (as frequently happens) these terms are not on record, or are incomplete, certain legal principles apply. The first is that the relationship is one of *mutual trust*. The principal must do nothing to hinder the agent in earning his due, if he appoints a "sole agent," he must not entrust the transaction to other hands. If he does, he will have to pay the sole agent also. He must reimburse to the agent all expenses and losses properly incurred in doing what he was authorised to do. The agent must act honestly and loyally towards his principal; he must not make a secret commission or profit for himself, over and above what has been agreed; he must use proper skill and care, according to his qualifications, in his principal's business; he must keep proper accounts and pay over to his principal the money from time to time collected on the latter's behalf. If he has a *personal interest* in any transaction, he is bound to make *full disclosure*. The law will not tolerate any conduct which brings about a conflict between the agent's duty to his principal and his own *personal advantage*. The agent is therefore failing in his duty if, unknown to his principal, he buys the principal's property for himself, or sells his own property to the principal.

(4) The Principal and Third Parties.—So long as the agent has acted within the *scope* of his agency, the principal is bound by any authorised act done or agreement made between the agent and other parties. And even where the act was unauthorised, the principal is bound if he has, by words or conduct, led others to believe that the agent was authorised to do it. If the agent does something outside the scope of his agency—an act which no third party would reasonably expect the agent to have power to do—the principal is not legally bound towards the third party. These rules apply also to cases where the agent has received money or property from a third party on his principal's behalf, but fails to hand it over to him. The principal cannot claim payment over again from the third party unless the latter ought clearly to have known that the agent was not authorised to receive it. In other words, only contracts entered into and payments made by or to the agent in the *ordinary course of his business* are enforcable by and against the principal and third parties.

If the agent is also the *servant* of the principal, similar rules apply where the agent, in the ordinary course of his business, injures some third party by a wrongful act; the agent is liable in damages, and the principal also if the act (which turns out to be wrongful) was done within the *apparent scope* of the agency. So, if one of the agent's ordinary duties is to deliver goods on his principal's behalf by van, and while he is doing so he runs over a pedestrian through his own careless driving, the principal as well as the agent will be liable to pay damages for the injury.

But the principal cannot be *prosecuted and punished*, by fine or imprisonment, for an agent's *crime* unless the principal himself authorised or took part in it.

(5) The Agent and Third Parties.—If the agent makes a contract *without disclosing* that he is merely *acting as agent*, he is *personally* liable to the other party to the contract, even though he intended to act on his principal's behalf. If he discloses that he is acting merely as an agent, but does not disclose his *principal's name*, he (the agent) will not usually be personally liable. If the contract is in writing, he can safeguard himself by signing it "as agent," "on account of," "on behalf of," or "for" a named person.

If, on the other hand, the agent gives a third party to understand that he is acting for a certain principal but has *in fact* no authority to act for him, and if the principal later refuses to accept liability, the agent is liable to the third party for his false statement or pretence. This is known as *breach of warranty*—that is, he "warranted" or guaranteed that he had authority to bind his principal, but has broken his warranty; having thus left the third party without right of redress against the principal, the agent must bear the liability himself.

2. Law of Tort

This branch of the law deals with the relations, between one individual citizen and another, which arise from the operation of the law itself, without the necessity for the parties to do any act to put them into legal relations with one another. As was pointed out above (D9 (1)), if A and B are to be linked in a contractual relationship, each of them must take some step to bring that relationship about. No such step, however, is necessary in connection with the matters dealt with by the Law of Tort. Everybody has a right to expect that his person and his property shall be inviolable by other private citizens; he also has a right to expect others to refrain from attacks upon his character and his business reputation. These rights do not arise from any agreement or other act on his part, but from the general principles of the law.

A *tort* is the violation of such a right, which entitles the injured party to bring a *civil action* for damages to *compensate* for the injury he has suffered. The word *tort* (in French "wrong") is derived from the Latin *tortus* meaning "twisted" or "distorted."

It will be seen from the Table (D3) that some torts (*e.g.*, assault) may also be crimes—that is, they may entitle the injured party *either* to bring a *civil action* for *damages* or to *prosecute* the offending party and have him *punished* by a *criminal* court in cases where the offending party's action is liable to harm the community at large, a personal assault, for example, may lead in some circumstances to general disorder, and in that event it will become a matter for intervention by the State through the criminal courts (see D35–36). This section, however, deals only with the *civil remedies* which, as in breaches of contract, are primarily *damages* and sometimes *injunction* (see D11(1)).

The main headings under which torts may be committed are shown in the Table.

Trespass is a wrongful act committed by one citizen, against the will of another citizen, either against the latter's person or in disturbance of his possession of land or other property.

(1) Trespass against the Person may be by way of *assault, battery,* or *false imprisonment.* An *assault* is an attempt to do violence to the person of another, if the act is fully consummated it becomes a *battery*. Thus it is an *assault* for one man to shake his fist in the face of another, or to adopt a threatening attitude towards another, or deliberately to set his dog on another person. If the first person actually strikes the other person, or if the dog, encouraged by the first person, actually bites or harms the other person, that is a *battery*. In order to constitute an assault or battery, and to render the trespasser liable to an action for damages, his act must be *deliberate*. It is not assault and battery if A *accidentally* knocks against B in a crowd, with the result that B falls and is injured. The act by the trespasser must also be *against the will* of the person injured. Thus an operation performed by a surgeon, though it may seriously affect the body of the other person, is not an assault or battery if the other person has consented to the operation, but such an operation, performed without the other person's consent, may amount to an assault or battery.

Certain acts which would in the ordinary way constitute assault or battery are excusable; it is recognised, for example, by the common law, that a parent or a teacher has the right to inflict reasonable chastisement upon a child or pupil in his care, and provided that the chastisement is not excessive the child or pupil has no right of action. If, however, the chastisement results in serious injury or amounts to brutal violence, then the person inflicting it will be liable to an action for damages.

False imprisonment means the *unlawful restraint* of one person by another. It need not amount to actually locking up a person in a room, it is sufficient if his freedom of movement is *totally restrained* either by confinement or by the use of force or threat of force. It should be noted that the restraint must be unlawful; it is not, for example, unlawful for a police officer to arrest a person engaged in committing a crime, or a person whom the officer has reasonable grounds for suspecting of committing, or being about to commit, a violent crime. Even a private citizen may lawfully arrest a person who has actually committed a violent crime or whose behaviour has led to a breach of the peace (see D35–36).

The tort of *malicious prosecution* is committed by a person who makes a *criminal charge* against another person where the proceedings terminate in the acquittal of the latter, where the first person was actuated by spite or ill-will, where there was no reasonable or proper cause for the proceedings, and where the second person has suffered damage as a result. The essence of the tort is *malice* on the part of the person who

brought the criminal charge; it is not sufficient that he was honestly mistaken.

(2) Trespass to Land arises whenever one person *enters unlawfully* upon land or a building in the possession of another person. Two important points should be noted, as several popular fallacies exist about this tort. First, trespass to land is not in the ordinary case a crime, unless there is some Act of Parliament which makes the trespass a criminal offence (for example, under certain statutes it is a criminal offence for an unauthorised person to cross a railway-line or to enter a Government airfield from which considerations of security require unauthorised persons to be excluded). Secondly, it is not necessary, to constitute a trespass, that *actual damage* should be done to the land or building on which the trespasser has set foot. The essence of the tort is interference with the possession of the other party, and this may arise by merely walking across his field, or throwing refuse upon it, or placing or erecting anything on the land without the other party's consent; any act of *physical interference* suffices.

The *tort of nuisance* arises when an occupier of land or premises does something there which substantially interferes with the enjoyment by a neighbouring occupier of his land or premises In *trespass* (see above) the interference must be *physical*; this is not so in cases of nuisance For example, it is a nuisance if A allows his factory chimney to emit volumes of thick smoke which drifts continually into B's house or garden, or for A to carry on, in a building belonging to him, a trade or process which causes noxious smells or disturbing vibrations liable to interfere with B's enjoyment of his property. It is not, however, every such act that gives rise to an action for nuisance; there must be a certain amount of "give and take," particularly in urban areas, but people must not use their premises in an unreasonable or wilfully annoying manner. Thus it has been held that a teacher of music who had pupils singing in her house for several hours a day and on several days a week, which caused considerable disturbance to the person next door, was not committing a nuisance, since it was not unreasonable for her to use her house in this manner On the other hand, when the person next door retaliated by clashing domestic implements and deliberately making as much noise as possible while the lessons were going on, he was held to have committed a nuisance because his conduct was unreasonable and wilfully annoying. But every case depends upon its own special facts A building contractor who keeps a pneumatic drill going outside a private house, in connection with building operations, is not liable to an action for nuisance, provided that the use of the drill is necessary to the work, that it is confined to reasonable working hours and limited to a temporary period; but if the owner of a motor-cycle were to keep its engine running, merely to demonstrate its power, outside his own garage for several hours a day, and on several days a week, his neighbours could claim that that was (in law) a nuisance.

All the above examples may be classed as *private nuisances*, and they are torts but not crimes. There is, however, another class, known as *public nuisances*, which become criminal offences if they are liable to injure the public in general Examples of these are leaving an unlighted obstruction on a public road, blocking a public footpath, or allowing a building to get into such a state of disrepair that it causes a danger to users of the public highway In such cases the person causing the public nuisance may be prosecuted and punished and, moreover, any individual citizen injured by such conduct may have a right to bring a civil action for damages.

(3) Trespass to Goods is an unlawful disturbance by A of B's lawful possession of his goods. Such disturbance may arise by seizure or removal of the goods without the owner's consent or by conduct causing damage to the goods. It follows that every theft of goods is also a trespass; but for the preservation of public morality it is laid down that, if there is a criminal element in the conduct of the wrongdoer which makes his trespass theft, the injured party cannot bring a civil action for damages unless the thief has first been prosecuted in a criminal court.

The *tort of detinue* consists in the wrongful detention by one person of another's goods and his failure or refusal to deliver them up when demanded.

The *tort of conversion* or *trover* arises when A wrongfully appropriates the goods of B to his own use or to the use of another person, depriving the owner of them permanently or for a substantial time, or destroying them These torts of *detinue* and *conversion* can be committed only against goods or articles of property, they cannot arise from interference with fixtures permanently attached to a building, growing crops or trees, but these torts may be committed if, after such things have been removed or cut down, the wrongdoer detains or converts them to his own use.

(4) Negligence in law has a very specialised meaning, it is not "neglect" or "carelessness" in the ordinary sense, but failure to take such care as the circumstances of the particular case demand In the *tort of negligence* there are two essential elements—first, a *legal duty* to exercise proper care and, secondly, a *failure* to take such care No action for negligence can be brought by A against B, even if B has been grossly careless, unless the relations between the parties were such that B was under that legal duty towards A. Moreover, the *degree of care* which A is entitled to expect from B will vary according to the nature of those relations.

One obvious example where the legal duty of care arises is among persons using the roads All of us have the right to use the roads for the purpose of travelling, on foot or in some vehicle, and the manner in which each of us exercises that right will obviously affect the safety and comfort of other road-users. There is therefore a *legal duty of care* upon every road-user (under the common law, and quite apart from the provisions of Acts of Parliament relating to motor-cars) to exercise his right to walk or drive with due regard to the similar rights of other road-users. And, equally obviously, the *standard or degree of care* which it is reasonable to expect from the driver of a powerful car is higher than that which is expected from a pedestrian, since the amount of damage which will be caused by carelessness on the part of the driver is very much greater than that which the pedestrian is capable of inflicting.

We are *not* here referring to *offences* under the Road Traffic Acts, for which drivers or pedestrians may be *prosecuted and punished* under the *criminal law* Careless or reckless driving or walking may be a criminal offence under those Acts, even if it has caused no injury to any person or property. In cases where such injury *has* been caused the *test* to be applied, in determining whether the injured person can *sue and recover damages* against the other party, is whether that other party has fallen short of the *standard of care* reasonably to be expected from him. It is true that disobedience to a provision of the Road Traffic Acts, or neglect of the Highway Code, may constitute *evidence* helping to prove that the latter party was lacking in the proper standard of care required of him; but there may be other circumstances which show that he was *negligent* in law, and liable to an action by the injured party for *damages*, even though he committed *no criminal offence*.

There are many other relationships where the *duty to take care* arises. One of these is the relation between *the occupier of premises* and persons *coming on to the premises*, whether they have a right to be there or not. Towards *trespassers* (see above) the duty of the occupier is merely a negative one—he must not "set a trap"—*i.e.*, he must not deliberately do anything calculated to cause injury, nor must he do any act which, if done carelessly, is reasonably likely to cause injury. If he knows a trespasser is on the premises he must *warn* him before he *does any dangerous act*; the fact that the trespasser has no lawful right to be there does not entitle the occupier (for example) to weaken the supports of a bridge or set off an explosion without warning. If the occupier does so, he will be liable to be sued for damages, in an action for negligence, even by a trespasser who is injured as a result.

The other rules, relating to the duty of care owed by an occupier to persons coming on to his premises, have been modified (as from January 1st, 1958) by the Occupiers' Liability Act, 1957.

The occupier's duty towards a *trespasser* remains *unchanged*. The Act, however, abolishes the distinction between an *invitee* and a *licensee*, both of whom it describes by the new term, *visitor* The principal rules are.—

1. The occupier owes the *same duty* ("the common duty of care") *to all his visitors*, except in so far as he is free to, and does, extend, restrict, modify, or exclude his duty, to any visitor, by agreement or otherwise.

2. The "common duty of care" means a duty to take such care as in all the circumstances is *reasonable*, to see that the visitor will be *reasonably safe* in using the premises for the purpose for which he is invited or permitted to be there.

There are *subsidiary rules*—*e.g.*, that an occupier must expect *children* to be *less careful than adults*, and that a person "in the exercise of his calling" (*e g.*, a window-cleaner) can be expected to appreciate and guard against special risks incidental to that calling. And a *landlord* of premises, if he is under a *legal obligation towards his tenant* to keep the premises in repair, is to owe *to visitors the same duty* as if the landlord were the occupier, so far as concerns dangers arising from his default in carrying out that obligation.

Among the classes of persons upon whom the law imposes a *duty to take care* are those who practise a *profession or calling* which, from its nature, demands some special skill, ability, and experience. A man who is advised or treated by a physician, surgeon, or dentist, or who consults a lawyer or an architect, is entitled to expect him both to possess and to exercise a reasonable degree of such skill, ability, and experience. If the professional man falls short of the *proper standard*, the patient or client may bring against him an action for damages on account of his negligence. But a mere error of judgment on a difficult point does not amount to negligence, provided that the professional man possesses the proper standard of knowledge and skill and has used them carefully and conscientiously to the best of his ability. And he is not liable, by virtue of his professional status, to an action of negligence for something he has done while acting otherwise than in his professional capacity—*e.g.*, a solicitor who is asked to express an opinion on the value of a house (which is no part of his professional duty).

(5) Defamation.—The tort of *defamation* is committed by a person who *attacks the reputation* of another by "publishing" a *false and defamatory* statement concerning him to a third party. If the defamatory statement is *in writing* or some other *permanent* form (*e.g.*, a picture, a film, or a gramophone record), then the action will be for *libel*. If the defamatory statement is in *spoken words* or some other *non-permanent* form (*e.g.*, by signs or gestures) it will be *slander*.

Another important distinction must be observed at the outset. In cases of *libel* the person whose reputation has been attacked may sue for damages *without proof of "special damage"*—*i.e.*, proof that he has *suffered actual harm* from the libellous statement; while in *slander no action* can normally be brought *unless special damage* can be proved. There are, however, five exceptional cases where such proof is unnecessary, *viz.*, in slanders:—

(*a*) *disparaging* a person in the way of his *business, profession*, or *office of profit* (*e.g.*, saying of a doctor that "he is ignorant of the first principles of medicine");

(*b*) imputing *dishonesty* to a person holding an *office of honour* (*e.g.*, saying of a Councillor that "he gives contracts to his friends");

(*c*) imputing that a person has committed a *crime punishable by imprisonment* (*e.g.*, saying of a man "he is no better than a thief");

(*d*) imputing that a person is suffering from a *contagious disease* of a disgraceful kind (especially a venereal disease);

(*e*) imputing *unchastity* to a *woman or girl*.

In these five cases "publication" of the slander alone is sufficient to give rise to an action, without proof of special damage; for slanders of other kinds no action can be brought unless special damage can be proved.

Note also that no action can succeed, either in libel or slander, unless the statement complained of is (1) *false*, and (2) *defamatory* and unless (3) there has been *publication* to a *third party*. (1) The statement must be false "in substance and in fact", if it is substantially true the person complaining has suffered no injury, recognised by law, to his right (see D12 (1)) to the inviolacy of his reputation. (2) The statement must be *defamatory*—*i.e.*, it must be one which "tends to lower him in the estimation of right-thinking members of the community," or which is "calculated to expose him to hatred, ridicule, or contempt." (3) *Publication*, in this context, means simply *making known* the defamatory statement to at least one *third party*. If the defamatory statement is conveyed *only to the person defamed*, and to no one else, there is no "publication," and the person defamed has *no civil remedy*.

In one exceptional case—where a defamatory statement, *in writing*, is likely to lead to a *breach of the peace*—the person making it may be *prosecuted* for the offence of *criminal libel*, for the purpose not of compensating the injured party, but of upholding law and order (see D6 (1)). In this exceptional case the *truth* of the statement (see above) is *no defence*, and *publication* to a third party is not necessary to secure a conviction. But there is no such offence as "criminal slander."

If a defamatory statement is made reflecting on a *class of persons* generally (*e.g.*, an attack on "Methodists" or "coloured people" or "money-lenders") that will not entitle a person who happens to belong to that class to bring an action unless he can show that *he personally* was aimed at and defamed. The family of a *deceased person*

cannot bring an action for a libel or slander upon the reputation of the deceased.

If the person sued puts forward the defence that the words he used were "not published of and concerning" the person bringing the action, the question must be decided whether those to whom the statement was published could *reasonably understand* it to refer to him. If such understanding is reasonable, then it is no defence for the person who made the statement to show that he *did not in fact intend* to refer to the other person, or even that the latter's existence was unknown to him.

Some statements are defamatory in their *natural and primary sense* (*e.g.*, "John Brief is a thoroughly dishonest lawyer"); others may appear unexceptionable if looked at literally, but may have a defamatory meaning in a particular context, or in particular circumstances known to the persons to whom they are published (*e.g.*, "I hear Mrs. B has left her doctor a lot of money. A fine kind of doctor *he* is!"). In cases of the latter kind the person who claims that the published words are defamatory of him must plead an *innuendo*—*i.e.*, he must set out, in his statement of claim, the meaning in which he alleges the words complained of were used. It will be the duty of the judge to decide, as a matter of *law*, whether the words are *capable* of bearing that meaning; the jury will have to decide, as a question of *fact*, whether the words complained of did actually convey that meaning to those who heard or read them.

There are several recognised defences to an action of libel or slander:—

(1) *Justification*.—A plea that the words complained of were *substantially true*. Once the words have been shown to be defamatory, it is for the person who used them to prove their truth—not for the party injured to prove them false.

(2) *Absolute Privilege*.—By common law, or by Act of Parliament, defamatory words used on certain particular occasions, though published to third parties, cannot give rise to any right of action. The occasion is "absolutely privileged." No party to any *legal proceedings*, nor any witness, counsel, or member of the jury, nor of course the judge, can be called upon to answer for any words he has used *during the proceedings*, however spiteful, and however harmful they may have been to the reputation of any other person. The rule applies to *pleadings* (*i.e.*, allegations in writing, filed at the court) as well as to statements made in court by word of mouth.

Similar protection applies to words spoken *in Parliament* by a member of either House (though words spoken outside either House are not protected). And under the Parliamentary Papers Act, 1840, those who publish (in the ordinary sense of the word) the proceedings of either House, by its authority, are protected in the same way; so are official communications, on *affairs of State*, made by a minister to the Monarch, or by one officer of State to another in the course of his official duty. To all these *absolute privilege* applies.

(3) *Qualified Privilege*.—Apart from the cases just mentioned, there are other *occasions* which are *privileged*, not absolutely, but in a *qualified* sense. The *nature of the qualification* will be explained below; meanwhile it may be said that a *privileged occasion* of this latter kind arises whenever the person making a communication has an *interest*, or a legal, social, or moral *duty to make it*, and the person to whom it is made has a corresponding interest or duty to *receive it*. A common example is a reference given, about the character of a servant, by a former to a prospective employer; another is a report made, on the commercial credit of a trader, by one person who has dealt with him to another who intends to do so. Other occasions of *qualified privilege* are *reports* of *judicial proceedings*, of *public meetings*, and of the *proceedings* of municipal or other *public bodies*.

Such occasions are *privileged* to this extent and with this qualification—that there was no *malice* (*i.e.*, spite or other *improper motive*) in the mind of the person when he made the communication. If there was malice, then the fact that the occasion was one of qualified privilege will not protect him from an action for damages at the suit of the person defamed. In any such action it is the duty of the judge to decide, as a question of *law*, whether the occasion was one of qualified privilege; it is for the jury to decide, as a matter of *fact*, whether the defendant was malicious in what he wrote or spoke. (Contrast occasions of *absolute privilege*, where the presence or absence of *malice is immaterial*.)

(4) *Fair Comment* "on a matter of public interest."—This form of defence is most commonly employed by newspapermen, reviewers, and critics. If this defence is to succeed, the words to which it relates must be really *comment* (*i.e.*, expressions of opinion, not statements of fact) the comment must be concerned with *a matter of public interest* (*e.g.*, a book, a play, a musical performance, a political speech, or the public actions of men in the public eye—but not their private lives). Lastly, the comment must be *fair*—and it cannot be fair if it is actuated by *malice* in the mind of the commentator. If he has mingled with his comment some statement of *fact*, and that statement is inaccurate or misleading, that in itself will prevent the comment from being regarded as fair. The *onus is on the defendant* who is pleading fair comment to establish that what he is seeking to defend is really *comment*, that the matter on which he commented was one of *public interest* (not, for example, private scandal), and that the comment is *not based on any misstatement* of facts or *otherwise unfair*. Dishonest or insincere comment cannot be fair; but, on the other hand, an honest belief in the commentator's mind that his comment was fair is not enough for a successful defence. The comment must be fair *in fact*.

The usual *remedy* in actions of *libel* and *slander* is damages—a sum of money sufficient (in the jury's view) to compensate a man for the harm his reputation has suffered. In certain rare cases the Court may, in its discretion, grant an *injunction* ordering the defendant not to publish or not to repeat the publication of a libel.

The Defamation Act, 1952, reduces the risk of legal proceedings against anyone who *innocently* "published" a libel. The "publisher" may make an *offer of amends*, *i.e.*, an offer to "publish" a *correction and apology*, and to take practicable steps to *notify* those who have received copies of any defamatory document. (*a*) If the offer is *accepted* and the promise performed, the party defamed cannot bring, or continue, an action for libel or slander. (*b*) If the offer is *rejected*, then the "publisher," in any action taken against him, may plead, *in defence*, that the words were "published" innocently, and that the offer of amends was made as soon as practicable. *Innocent* publication means (1) that the "publisher" did not intend the defamatory words to refer to the other party, and knew of no reason why they might be understood to refer to him; or (2) that the words were not in themselves defamatory, and that the "publisher" knew of no reason why they might be understood to defame the other party; also that, in either case, the "publisher" exercised all reasonable care in regard to the "publication."

V. THE LAW OF PROPERTY

I. In General

(1) Living Persons.—The special rights and disabilities which affect the ownership and disposal of property by certain classes of persons have been already dealt with under the heading of *Status* (D7–8). It is unnecessary to add anything here on the law of property *in general*, so far as living persons are concerned; but different rules are applicable (as will be seen below) to the ownership and disposal of *land and buildings* as compared with *property of other kinds*. The reason for this main distinction is that the former are, in their nature, *immoveable* and *cannot be physically transferred*, as can money and "chattels" (*i.e.*, animals and *tangible objects* which are capable of being owned). In addition, there is a third class—certain *intangible things* which can be owned and dealt with—for example, the right to be paid a debt, a share or stock in a company, an insurance policy, or a patent; these are known as *things in action*, and they can be transferred only in certain formal ways, which will be described below.

(2) Deceased Persons.—It is obvious that the law of any civilised community must make provision, not only for the *transfer by a living person of his property*, but also for the *transmission of that property* (*his "estate"*) *upon his death*. English Law permits every person who is *not disqualified by infancy or lunacy* (see D7) to *give directions, during his lifetime, as to the disposal of his estate upon his death*; he can do this by means of a *will*. If he leaves *no valid will* he is said to die *intestate*, and in that event *the law itself* lays down how his estate is to be distributed. A concise survey of the law governing the estates of deceased persons is given below.

Wills and Intestacies.—The law of wills is highly technical, much trouble can be caused by a "home-made" will, and it is wise to seek a solicitor's advice. It is only possible here to outline the *formalities* necessary to make a valid will, and the *procedure* to be adopted after a death. The rules stated are those under English law—applicable to England and Wales, but not Scotland or Northern Ireland.

(1) The Nature of a Will.—The person making a will—the *testator*—sets down how he wishes his property to be disposed of after his death, and states the names of the persons (the *executors*) who are to attend to its disposal.

The executors may be, but need not be, some or all of the persons whom the testator desires to benefit under his will. One executor alone is sufficient in law, but if that one dies before he (or she) has completed his duties, delay and difficulty may arise. It is therefore better to appoint *at least two* executors, if one dies, the other has full powers to continue the work. If the testator's *estate* (that is, his property) is large, it may be best to appoint a bank as executor, all banks have trustee departments which are experienced in such matters. They have scales of charges for executorship work, which will be supplied on request. A personal executor is not permitted to charge for his work, unless the will authorises him to do so—a thoughtful provision for a complicated estate. Nor is the executor bound to accept the executorship when the death occurs.

A will "speaks from death"—that is, it has no legal effect until the testator dies, it can be *revoked* (that is, cancelled) in various ways, or alterations can be made by *codicil*, which is really a supplementary will. Further, the property to which it relates is that of the testator *at the date of his death*, which may be more or less than what he owns at the date when the will is made. The will can be revoked or varied as often as desired to suit changing circumstances; its provisions are not final until death.

Generally speaking, a testator may make whatever provisions, in regard to his or her property and the persons to be benefited, he or she thinks fit. He or she may even direct that his or her wife, husband, or children are to be deprived of all benefit from the estate; but, if he or she does so, it will be well to give the reasons, either in the will itself, or in a signed, witnessed, and dated document, which should be left with the will.

Under Acts of 1938 and 1952, a husband or wife, an unmarried daughter or son under twenty-one, or a son or daughter "under disability" (that is, one who for some reason is incapable of looking after himself or herself), who is not adequately provided for under the will, may apply to the Court for "reasonable provision for maintenance" out of the estate, the Court has power either to refuse the application or to grant the applicant whatever maintenance it thinks fit. In making its decision the Court will take note of the testator's reasons for his failure to provide for the applicant in question. (See also D32(2)).

If a person dies without leaving a valid will, he is said to die *intestate*. In that case somebody (usually the husband or wife or next of kin) must apply to the Probate Registry (at Somerset House in London or in the nearest District Registry elsewhere) to be appointed *administrator*. An administrator has the same rights and duties as an executor. If there are children under twenty-one, and in certain other cases, there must be at least two administrators, and the procedure on death is more involved and troublesome than where executors have been appointed by will. Further, as the testator has not directed what is to happen to his property, the law has laid down an *order of succession*, which the administrators must observe. The intestate's husband or wife is then entitled first to the *personal effects* (furniture, household goods, motor-cars, books, etc.); next, to the whole of the estate, if there are no children or near relatives, or £5,000 if there are, and, after that, the husband or wife and children have certain rights in the remainder of the estate, if any, details of which can be found in the Intestates' Estates Act, 1952. If there is no husband or wife, or no children, or neither, the next of kin of the intestate will benefit in order of nearness of their relationship to the deceased.

It is always prudent to make a will, however simple, since by doing so the testator exercises control over the disposal of his property and saves considerable trouble for his family.

(2) The Execution of a Will.—The formalities must be strictly observed, except in the case of soldiers, sailors, and airmen on active service (including members of the Women's Services and nurses), for whom informal directions, even in a letter or by word of mouth, are sufficient. For all other testators, inattention to the formalities may render the will invalid, and will in any case cause considerable trouble and expense.

The will must be *in writing—i.e.*, not by word of mouth—handwritten, typewritten, or printed, but the wording need not be in legal or formal language, so long as it clearly identifies the testator, the executors, the various kinds of property dealt with, and the persons to be benefited. It should also state that the following formalities have been carried out when it was executed—that is, signed by the testator and *attested—i.e.*, witnessed by two competent persons:

(a) *The will must be signed* by the testator, or by some other person in his presence and by his direction. If the testator can write, his *usual* signature will suffice; if he is illiterate or too unwell to sign in full, he may make his "mark" or his initials alone. If he is incapable of holding a pen, someone else may sign for the testator, provided he is present at the time and authorises the signature. If the testator is blind or otherwise incapable of reading the will, it should be read over to him before his signature or mark is placed on it.

(b) *The signature or mark must be at the foot or end* of the will. This means (1) nothing added

below the testator's signature, and (ii) nothing written anywhere on the document *after the testator himself has finished signing*, will be valid, except the signatures, addresses, and descriptions of the witnesses. If, therefore, at the last minute the testator desires some addition, alteration, or deletion to be made, he and the same witnesses must sign or put their initials against the addition, alteration, or deletion, which otherwise will be ignored.

(c) *The testator's signature* must be made or (if he cannot sign) acknowledged *in the presence of two witnesses*, who must both be *present at the same time*. Any persons may be witnesses, so long as they are capable of understanding what is going on. They need not read the will or know its contents, but if either of them is a *person who is to take a benefit* under the will, he or she will *lose that benefit*. It is therefore safest to call in witnesses who are strangers to the testator. Both witnesses must be *present together* when the testator signs (or acknowledges) his signature. It will not be a valid attestation if first one witness, and then the other, is called into the room. (The wife or husband of a beneficiary must not be a witness.)

(d) *The witnesses must sign the will in the presence of the testator.* Either witness may, if necessary, sign by mark or initial, but no other person may sign on his behalf. For identification purposes it is usual and desirable for the witnesses to add their addresses and occupations, in case of a subsequent dispute which may necessitate their being found to give evidence

If the will consists of several pages, they should be fastened together before execution and the signatures of the testator and witnesses should appear at the end of every page, not to satisfy the rules set out above, but as evidence that every page formed part of the will when it was executed.

It is desirable (though not legally essential) that the will should bear, just above the signatures of the witnesses, an *attestation clause*—that is, a formal statement that these formalities have been carried out The usual wording of this clause will be found in the example shown below.

All these rules apply in exactly the same way to a *codicil*.

(3) **The Contents of a Will.**—The opening words should clearly identify the testator by his full names, occupation or description, present address and (if possible) other recent addresses, and declare that this is his *Last Will*. It is sometimes found at death that a testator has a banking account or stocks and shares registered in his name at some past address, and in such cases the bank or company concerned, wishing to be sure that his identity is clear, may insist upon a sworn statement to the effect that he is the same person as the person they knew as customer or shareholder. (See the example below.)

Next follows the *revocation clause*—a declaration that the will now being made *revokes* (that is, cancels) all previous wills and codicils. If this is not inserted, doubts may arise after death as to whether the new provisions are intended to be substituted for, or merely to supplement, provisions in an older will. If it is intended that the older will is to remain valid in part, that should be clearly stated. If the document now being executed is a *codicil*, it should be described as such, and the date of the original will to which it is a codicil should be mentioned, and also which parts of the original will are being *confirmed*, to stand good, and which *revoked*.

The next clause should appoint the executors, who must be identified by their full names and descriptions or addresses. "My brother John," "my son Charles," or "my mother" will suffice, since only one person could possibly answer to any of these descriptions; but "my wife" is not enough without giving her names in full, since it does not follow that the person who is the testator's wife at the time of his death was necessarily his wife when the will was made.

Next follow the directions for disposal of the testator's property. *Bequests or legacies* of particular articles ("my pearl necklace," "my oak bedroom suite") or of particular investments ("my 3% War Stock")—these are *specific legacies*—must clearly identify exactly what is being bequeathed. In the case of land or a house, the full description should be given—"my leasehold house and grounds at 31, Acacia Road, Redhill in the County of Surrey," or "my freehold farm known as 'Newlands' at Northgate in the County of Derby." The words "I devise" are the technical words appropriate to freeholds: "I bequeath" to all other kinds of property: the effect is the same. (Bequests or legacies of *sums of money—pecuniary legacies*—should preferably be stated in words rather than figures; if figures are used the accidental omission of a nought may be disastrous.)

Finally, there is the clause that deals with the *residue* of the Estate—that is to say, whatever will remain after the executors have paid the funeral expenses, death duties (if any), legal and other fees, the testator's debts, and the pecuniary legacies he has bequeathed, and after the specific bequests have been handed over to those entitled. Such a clause is necessary because no testator can be sure, when he makes his will, that he has disposed exactly of everything of which he may die possessed, or that all the persons to whom he has made bequests will necessarily be alive when he dies. In general, the death of such a person—a *legatee*—before the testator causes that person's legacy to *lapse*; but if there is a bequest of the *residue* to one person, or for division among a number of persons, no harm is done: the *lapsed legacy*, being left over and undisposed of, becomes *part of the residue* and passes under the final clause.

(4) **Revocation and Revival.**—A will or codicil may be *revoked*—cancelled—by "burning, tearing, or otherwise destroying" it with the intention of revoking. Destruction by accident, or without the testator's desire to revoke it, is ineffective, and if a copy exists, its provisions may be put forward as still valid. The revocation clause in a later will (see above) will be equally effective to revoke an earlier will; or some part of the earlier will may be revoked by a later codicil clearly referring to that part.

A will is also *revoked*—generally speaking—by *subsequent marriage*, since the law assumes that, if the testator who is newly married had had time for or given thought to the matter, he would have altered his will. If he did not do so after marriage, he will die intestate.

If a testator makes *Will A*, and later on *Will B* containing a revocation clause, Will A is revoked—*i.e.*, cancelled. But if *Will B* is in turn revoked by *Will C*, that does *not revive*—*i.e.*, revalidate—*Will A*, unless *Will C* says, in so many words, that "*Will A* is hereby revived."

SPECIMEN WILL

I JOHN SMITH of 31 Acacia Road Redhill in the County of Surrey Company Director [1] HEREBY REVOKE [2] all wills and testamentary documents [3] heretofore made by me AND DECLARE this to be my LAST WILL.

1. I APPOINT my wife JANE SMITH [4] and my Solicitor EDWARD JONES to be jointly the Executors of this my Will.

2. I DEVISE my freehold farm known as "Newlands" situate at Northgate in the County of Derby unto my son JAMES SMITH in fee simple.[5]

3. I BEQUEATH the following specific legacies: [6]

(1) To my son THOMAS SMITH any motor-car of which I may be the owner [7] at the date of my death.

(2) To my said son JAMES SMITH all my shares in the Company known as John Smith & Sons Limited.

(3) To my said wife all my personal chattels [8] not hereby or by any codicil hereto otherwise bequeathed [9] for her own absolute use and benefit.[10]

4. I BEQUEATH the following pecuniary[11] legacies:

(1) To my daughter JULIA SMITH the sum of TWO THOUSAND POUNDS.

(2) To my secretary EVELYN ROBINSON the sum of ONE HUNDRED POUNDS.

5. I DEVISE AND BEQUEATH all the residue [12] of my real and personal estate whatsoever and wheresoever not hereby or by any codicil hereto otherwise expressly disposed of as to my freeholds in fee simple [5] and as to my personal estate absolutely unto my said wife JANE SMITH for her own absolute use and benefit.[10]

6. I DIRECT that any executor of this my Will being a Solicitor or a person engaged in any profession or business may be so employed and act and shall be entitled to make all proper professional charges [13] for any work done by him or his firm in connection with my Estate including work which an executor not being a Solicitor or a person engaged as aforesaid could have done personally.

IN WITNESS whereof I the said JOHN SMITH the Testator have to this my LAST WILL set my hand this twelfth day of April One Thousand Nine Hundred and Fifty-Five.

[14] SIGNED AND ACKNOWLEDGED by the above-named JOHN SMITH the Testator as and for his LAST WILL in the presence of us both present at the same time who at his request in his presence and in the presence of each other have hereunto subscribed our names as witnesses. } John Smith

George Matthews,
6, Elm Road,
Redhill, Surrey.
Chauffeur.

Ida Gray,
10, Oaktree Road,
Redhill, Surrey.
Children's Nurse.

Notes

[1] Profession is usually inserted for identification purposes.

[2] Revocation Clause—cancels all *previous* wills and codicils.

[3] "Testamentary documents"—includes both wills and codicils.

[4] Wife's *name* should be mentioned—he may have a different wife by the time he dies.

[5] "In fee simple"—technical words showing that the entire freehold interest is disposed of.

[6] "Specific legacies"—*i.e.*, legacies of actually specified things.

[7] Not "my motor-car"; he may sell his present car before he dies and perhaps buy a new one, in which case there might be a dispute as to whether he meant only the car he owned at the date of his will.

[8] This expression is defined in the Administration of Estates Act, 1925. It includes furniture, plate, china, wines, cigars, books, and other *personal effects*. It is better to use a word clearly *defined* by Act of Parliament than a vague word like "possessions."

[9] *i.e.*, all personal effects which the Testator has not left or will not leave to anybody else.

[10] These words show clearly that, although the wife is one of the Executors, with the duty of clearing up the estate for the benefit of *all* the persons to be benefited, these particular bequests are for *her own personal benefit.*

[11] "Pecuniary"—*i.e.*, money.

[12] "Residue"—everything left after all the other gifts have been disposed of, and debts paid.

[13] Charging Clause, without which the Executor who is a Solicitor would not be able to charge for his work on the Estate.

[14] This is the proper form of *attestation clause*—*i.e.*, the clause showing that the proper formalities for signing and witnessing were observed.

Probate and Letters of Administration.—It is a peculiarity of the English system that a deceased person's estate, upon his death, does not "vest in" (*i.e.*, fall into the possession of) the persons to whom he has left it by will, or among whom it has by law to be distributed (the "beneficiaries"), the estate vests, in the first instance, in his executor or executors, if he has appointed any such. (If he has made no such appointment, then, pending the appointment of administrator or administrators (see above), the estate vests (for the time being) in the Presiding Judge of the Probate Division of the High Court of Justice. that Judge has no duties in relation to the estate, but any notices that would, if there were executors, have to be served upon them, must be served for the time being upon him.) The generic name that applies both to executors and administrators, when their title has been lawfully recognised, is *legal personal representatives*; that is to say, they are *recognised by law as representing the deceased person*, for all purposes under the law of property, and for most purposes under the law of contract and the law of tort. Generally speaking, the deceased person's rights and liabilities are transmitted to his legal personal representatives, and can be enforced by or against them as soon as they have taken out a *grant of probate* or of *letters of administration.*

This "grant," in either case, is a document issued by one of the Registries and bearing the seal of the Probate Division of the High Court and the signature of one of its Registrars. It states the deceased's name and address, the date and place of his death, and *either* (1) that his *last will* has been *proved and registered* in the Registry concerned, or (2) that he died *intestate* (as the case may be); that (in the former case) the *executors*, or (in the latter case) the *administrators*, whose names addresses, and descriptions are given, are *entitled to administer* (*i.e.*, to deal with) all the estate which "vests in" them by law; and the document concludes by certifying that an *Inland Revenue Affidavit* has been delivered, showing the *gross and net values* of the estate and the amount of *estate duty and interest* (if any) paid. Where a will has been "proved," a photostat copy of the will is bound up inside the "grant"; if no will has been "proved" the "grant" consists of a single sheet bearing the above-mentioned particulars. It is important to note that, in either

case, the *title* of the *legal personal representatives* (*i.e.*, their legal right to deal with the estate) is evidenced by the "grant"—*i.e.*, the document by which the Court's authority is conferred upon them—and not directly by the terms of the will or by their relationship (if any) to the deceased. Anybody, for example, who is *purchasing property of the deceased* from the legal personal representatives is required only to *satisfy himself that probate or letters of administration have been granted to them*; such a purchaser is not in the least concerned with the terms of the will.

Whenever any *formal transaction* has to be carried out in connection with the deceased person's estate the "grant" must be produced, this applies in particular to dealings with land or buildings, "things in action" (see D 23 (2)), the initiation, defence, or continuation of legal proceedings for the benefit of the estate, and the transfer of the deceased's contractual rights. There are, however, a number of *informal acts* which the persons (if any) appointed by the will to be executors, or the nearest relatives who intend to apply for letters of administration, may properly do before the issue of the "grant". these include such common-sense matters as arranging the funeral, safeguarding and insuring documents and valuables, feeding livestock, locking up premises, and preserving property which would deteriorate if neglected. All persons should, however, take care *not to sell or dispose of any part of the estate before the "grant"* is issued. a person who, without lawful authority, meddles with the estate may find himself regarded as *executor de son tort*—*i.e.*, placed in the position of an executor by his own wrongdoing—and thereby bound to meet the liabilities of the deceased person, and pay the death duties (if any), for which he ought to have provided. Even a person named in the will as executor takes a risk if he does more than the most urgently necessary acts before probate, since it may turn out that that will is, for some technical reason, invalid, or some later will may come to light in which he is not named.

Not more than four persons can apply for a grant of probate or letters of administration. If therefore the will names more than four executors, the persons named will have to decide among themselves which of them are to apply. Even if there are no more than four, *none of them is compelled* to apply, unless he has already meddled with the estate. he can renounce his right by signing a form of renunciation. If the deceased has appointed no executor by will, one or more (not exceeding four) of the next-of-kin can apply for letters of administration. Apart from the special cases (see above) in which there must be at least two administrators, no grant will be made to any more distant relative of the deceased unless and until all nearer relatives have renounced their rights or been "cleared off"; this last expression means that it must be clearly shown that they are dead or for some other reason are incapable of acting as administrators. (The order of priority among the relatives entitled to take out a grant is (1) husband or wife; (2) children and their "remoter issue" (*i.e.*, grandchildren, great-grandchildren, etc.); (3) parents; (4) brothers and sisters and issue of deceased brothers and sisters, (5) half-brothers and half-sisters and issue of deceased half-brothers and half-sisters; (6) grandparents, and so forth)

It has been said above that the property of a deceased person "vests" on his death in his executor or executors, if any; if there are no executors it "vests" in his administrators as soon as they have been duly constituted as such by the "grant." *In law* these *legal personal representatives* (executors or administrators) have the same *powers* of disposing of the deceased's property as if they were the owners of that property in the fullest sense; but in accordance with the rules of *equity* (see D4) they must exercise their powers of disposal strictly in accordance with what is *just and conscionable*—*i.e.*, they must distribute the property itself, or sell it and distribute the net proceeds, as laid down by the terms of the *will* (if any); in case of an intestacy, as laid down by the *law of succession*, as set out in the Intestates' Estates Act, 1952. That strict exercise of their powers which conscience demands will be enforced, in case of need, by the Chancery Division of the High Court of Justice (see D5), *at the suit of any beneficiary* under the will or intestacy. But *purchasers* and persons other than the beneficiaries can safely deal with the legal personal representatives as though they were legal owners of the deceased's property, provided the "grant" is produced as evidence of their powers.

The *procedure* in applying for a *grant of probate* or *letters of administration* is that the applicants must make a *valuation* of the various kinds of property of which the estate consists; the value of each item is to be the value on the date of death. (It is not usually necessary to employ a licensed valuer, though this may be helpful if the estate includes valuable jewellery, antiques, or works of art.) An *Inland Revenue Affidavit*, for death-duty purposes, must be *completed* and *sworn before a Commissioner for Oaths*. This document is one of a number of printed forms (varying according to the nature and composition of the estate, and obtainable from Somerset House, the Estate Duty Office, and certain principal post offices). It is divided into headed columns showing (*a*) the descriptions and the values of the various parts of the estate (*e.g.*, cash at bank, Government securities, stocks and shares, furniture and effects, and so forth); a separate section shows (*b*) the funeral expenses and the debts which the deceased left owing. The *gross estate* consist of the items under (*a*), the *net estate* is calculated by deducting those under (*b*) from the gross total (the cost of a tombstone cannot be deducted).

In the simplest cases *estate duty* is payable on the *net estate*, according to a sliding scale; but no duty is payable on an estate of £4000 or less. (In all but the simplest cases it would be wise to consult a solicitor, as the law relating to estate duty is excessively complicated.)

Another part of the document sets out particulars of the deceased and of the applicants, and the kind of grant required. The document, when sworn, must be forwarded to the Estate Duty Office, who will *assess the duty payable* (if any) and interest on such duty from the date of death. This must be *paid in full* before proceeding further, *except* the part of the duty that relates to *freehold property*, which may be paid by instalments. (The deceased's bank will usually grant a loan or overdraft for the purpose of such payment.) When the duty has been paid the Inland Revenue Affidavit will be returned to the applicants receipted

The second document required is the *Form of Oath for Executors or Administrators*. This gives particulars of the deceased and of the applicants, as before, and declares *either* (*a*) that they believe the "paper writing" before them to be the deceased's *last will*, or (*b*) that the deceased died *intestate*, in either case they declare their *relationship* (if any) to the deceased, and the *capacity* in which they apply (*e.g.*, "the executors named in the will," or "the lawful widow of the deceased," or as the case may be); and they swear *to administer* the estate (the gross amount of which they mention) *according to law*, and to produce proper accounts whenever called upon to do so. This Oath must also be sworn before a Commissioner.

If there is a will it must now be signed (for identification purposes) by the applicants and the Commissioner for Oaths. If there is no will a third document is required, known as an *Administration Bond*. This is a printed form which must be completed and signed, sealed, and delivered (see D9 (2)) by the applicants and two *sureties*—*i.e.*, independent persons who are willing to *guarantee* that the applicants will carry out their duties according to law, under the *penalty* of forfeiting double the value of the estate if there is any default. (In practice, an *insurance company* will usually undertake *the duty of surety* for a reasonable premium, and in that event no other surety is required.) The Bond must be executed (*i.e.*, signed, sealed, and delivered by the individual

sureties, or sealed by the insurance company, and also signed, sealed, and delivered by the applicants) before a Commissioner for Oaths.

Finally, the applicants must take to the Principal Probate Registry at Somerset House, or to one of the District Registries outside London, (*a*) the receipted Inland Revenue Affidavit, (*b*) the duly sworn Oath for Executors or Administrators; (*c*) *either* the will (if any), duly marked with the signatures of the applicants and the Commissioner, *or* the Administration Bond, duly executed. If there is no hitch, the *grant of probate* or *letters of administration* will usually be posted to the applicants (or their solicitor) within about fourteen days.

(For the convenience of persons who have no legal adviser, there is a Personal Applications Department, situated in the Royal Courts of Justice, Strand, W.C.2, where the officials are extremely helpful in answering questions and showing applicants how to complete the forms. But in most cases trouble and delay will be avoided by employing a solicitor.)

II. Property in Land (Immoveable Property)

Although the *logical distinction* preserved in the legal systems of other countries is between property in land and buildings and property of other kinds ("immoveables" and "moveables"), English law has from an early date made the more artificial distinction between *real property* or *realty* (*i.e.*, *freeholds*) and *personal property* or *personalty* (*i.e.*, *leasehold* land and property of all other kinds). The reason is historical. In early times, if the possession of freehold land was withheld from its rightful owner his remedy was an action for recovery of the actual thing withheld—*i.e.*, the freehold land itself—and that very *thing* (in Latin, *res*) would be restored to the owner under an order of the Court. On the other hand, when property of other kinds (including leaseholds) was withheld from its rightful owner, his remedy was an action against the wrongdoer, in which the remedy would be the award of *damages* against the wrongdoer *personally* (*in personam*)—not an order for the restoration of the actual goods or other property withheld. Although that distinction in the remedies is no longer generally applicable, the terms (*realty* and *personalty*) have been retained.

1. Realty or Freehold Property.—The difficulties of this branch of the law are due principally to historical reasons which go back to the Feudal System. In a very practical sense that System recognised only the Monarch as the *owner* of land; those who held it from him were *tenants* (in French, "holders"). If the tenancy was one which was not limited to expire at the end of a fixed period it was known as "an estate in fee simple"—*i.e.*, a *freehold*; a tenancy which was for a fixed period only was known as "a term of years absolute," or a *leasehold*.

When the Feudal System came to an end this distinction remained. A freehold estate in land is still an interest which has *no fixed expiry date*, and the freeholder, out of that unlimited interest, can "carve," as it were, *fixed leasehold terms*, during which tenants will hold the land of him.

The property legislation of 1925 has profoundly changed and simplified the law. Until the end of 1925 one important characteristic of the freehold estate was that of *primogeniture*—the rule that, on the death of the freeholder intestate, the freehold passed intact to his *eldest son* or (if he left no son) to his eldest male heir. This was abolished by the Administration of Estates Act, 1925, which enacted that, in the event of a person's dying intestate after December 31st, 1925, the *whole of his property* (realty as well as personalty) should devolve upon his legal personal representatives (see D18); and that it should, as one whole, be sold and converted into money so far as necessary for the payment of the deceased's funeral expenses and debts, death duties, administration expenses, and for distribution among his next of kin. The eldest son, or heir, has no longer any special privilege.

Settlements.—On the other hand, a freeholder (whom we will call Charles), having a freehold estate in land—*i.e.*, an interest which has no expiry date—can *during his lifetime* create *successive interests* to take effect one by one. Charles can, if he so desires, *settle* his freehold estate to be enjoyed by himself during his lifetime; after his own death, by his eldest son George during that son's lifetime; then by his second son John, during John's lifetime, and finally by George's son Peter "in fee simple." The successive interests of Charles, George, and John are called *life interests*, the ultimate, future freehold interest, reserved for Peter to enjoy after the deaths of his grandfather, his father, and his uncle, is called a *remainder*. Both the life interests and the remainder are *rights of property* to which Charles, George, John, and Peter become *entitled immediately* the settlement is made—that is, they are *present rights* to the *future enjoyment* of the property, and those rights can be dealt with at any time, even before they "fall into possession." Since Charles, George, and John *must* some time die, Peter knows *now* that his freehold remainder *must* come, some time, to him or his personal representatives and, through them, to his next of kin (see above); for even if he dies young, while George and John are still alive, his right will not be "defeated" but will be preserved for those to whom his property may eventually pass under his will or intestacy. Therefore that *present right* to *future enjoyment* is a piece of property which Peter can deal with *now*, unless he is under twenty-one, or unless he is restricted by the terms of the settlement from doing so. George and John can, if they are so minded, do the same with their life interests—that is, they can *now* sell to another person, for hard cash, their present rights of future enjoyment, or they can mortgage (*i.e.*, pledge) those rights against a loan, on the understanding that they will get back those rights when the loan is repaid.

To watch over these successive interests, and to preserve the rights of the ultimate successor, Charles appoints *trustees* of the settlement, whose duty it is to act impartially by all the beneficiaries. A *trust corporation* (usually one of the bank trustee companies), which never dies, or *at least two individuals*, may act as trustees. The Trustee Act, 1925, provides for the appointment, by a simple procedure, of new trustees to take the place of those who die, become unfit, or unwilling to go on acting, etc. In the last resort the Chancery Division of the High Court (the guardian of equity) has power to make such an appointment, for "equity never lacks a trustee."

In order to enable landed property to be freely disposed of, it is provided by the Settled Land Act, 1925, that the person who is for the time being enjoying the current life interest (see above) has power to *sell the entire freehold* estate if he so desires. Nevertheless, the scheme of interests under the settlement is not defeated, for the purchaser from the tenant for life must pay the purchase-money not to him but to the trustees, they must invest the money in safe investments, and carry out the provisions of the trust with the necessary modifications. Each *tenant for life* will then receive the *interest or dividends* on the investments during his lifetime, just as formerly he would have received the rents and profits of the land during his lifetime; while the *remainderman* (Peter) will ultimately come into the *capital* of the trust fund (*i.e.*, the investments themselves) in lieu of the freehold interest. (By the terms of a recent Act, half the investments may consist of stocks or shares in commercial concerns recommended by a stockbroker or other competent adviser.)

2. Leaseholds.—We have seen above that the freeholder, out of his estate which is unlimited in time, can "carve" fixed *terms of years absolute* or *leasehold* estates. These terms may be of any length; the most common are terms of 999 and 99 years. The document by which such a term is granted is called a *lease*; the person granting the term is the *landlord* or *lessor*; the person to whom

it is granted is the *tenant* or *lessee*. But the lessor, by the grant of a lease, has not given up *all* interest in the land. The lessor's freehold estate is unlimited in time; when, therefore, the leasehold term (however long) comes to an end, the right to possession and enjoyment of the land will *revert* to the freeholder. That right, known as a *reversion*, is again a *present right* to *future enjoyment* and, as such, a piece of property which the freeholder can, if he wishes, dispose of *now*. The "sale of a reversion" is, in fact, equivalent to the sale of the freehold subject to an existing lease, it confers upon the purchaser the lessor's right to receive rent from the lessee throughout the leasehold term, and at the expiration of that term to *repossess and enjoy* the land without limit of time.

The *lessee* has a *legal estate* in the land for a *fixed term* of years, and he in turn (unless prohibited by the provisions of his lease) can grant *sub-terms* to expire at any time before his own *head-term*. This is a process which can be repeated, in turn, by each lessee, underlessee, sub-underlessee, and so forth, who will become respectively the underlessor, sub-underlessor, and so forth, of the person to whom the next subordinate interest is granted. Thus Michael, the freeholder, by granting to James a term of 999 years, leaves himself with a *freehold reversion* which will revert, at the expiration of the 999 years, into the possession of the then freeholder. James, by the grant of an underlease, can carve (out of his leasehold term of 999 years) a sub-term of 99 years in favour of William, whose underlessor or landlord he becomes, leaving himself with a *leasehold reversion* of 900 years. William, in his turn, can grant to Anne a sub-underlease for 21 years, leaving himself a *leasehold reversion* of 78 years, and so forth. The relationship of lessor and lessee, or landlord and tenant, subsists between William and Anne, James and William, Michael and James, this relationship is one of *privity of estate* as well as *privity of contract*. The former phrase means that each of these pairs of individuals is linked by their *mutual interest in the same term of years* as above described. The latter phrase, *privity of contract*, means that the *link is contractual*—it arises from the agreement between Michael and James contained in the headlease, the agreement in the underlease between James and William, and that in the sub-underlease between William and Anne. But between Anne and James, between William and Michael, there is no relationship of any kind, neither of contract nor of estate; Michael can look only to James, James to William, and William to Anne, to carry out the terms of the respective tenancies.

In certain circumstances, however, there may be *privity of estate* between two parties without *privity of contract*. Suppose Michael *conveys* (*i.e.*, transfers) his freehold reversion, *during the subsistence of James's lease*, to Robert. Thereby Robert will take over all Michael's rights; *i.e.*, he will become lessor, in place of Michael, to James as lessee, as well as being entitled to possession of the freehold when James's lease expires. Between Robert and James there will be *privity of estate*, arising from their mutual interest in the term of 999 years (as lessor and lessee respectively), but there is between them no *privity of contract*, for Robert and James have made *no agreement* with one another. The distinction may in certain circumstances be important.

The Form and Contents of a Lease.—A lease for a term of more than three years must be made by deed (D9 (2)) between the lessor and the lessee. It names and describes the parties, and sets forth that, in return for an annual *rent* (and sometimes on payment, in addition, of a lump sum called a *premium*), the lessor *demises* (*i.e.*, lets) to the lessee, for a term of so many years from such and such a date, the land in question with the buildings erected thereon. (In the law of property the buildings go with the land on which they stand.) Then follow the *lessee's covenants*—the promises which he is to perform: to pay the rent by stipulated instalments, on certain dates; to pay rates, taxes, and other outgoings on the property; to put and keep the property in full repair; to paint the inside and the outside of the buildings at stated times; to keep the property insured, to its full value, in the names of the lessor and himself; to permit the lessor periodically to inspect the condition of the property; to carry out repairs which the lessor, as a result of such inspections, may call upon him to carry out. These are some of the stock clauses; but every individual lease must be carefully studied in order to ascertain what the lessee's obligations are.

Next come the *lessor's covenants*—the promises which the lessor is to perform; the chief of these is that, if the lessee carries out his part of the bargain, the lessor will permit him "quiet enjoyment" of the property without disturbance during the term. Some leases also contain *stipulations* binding on both parties; for example, a *stipulation* that the rent shall be reduced or suspended if the property is damaged or destroyed by fire, and sometimes an arbitration clause. At the end of most leases comes a *proviso*, for the protection of the lessor, to the effect that he shall be entitled to expel the lessee, and to re-enter and repossess the property, if the lessee ceases to pay his rent or to perform his covenants as required, or in the event of the lessee's bankruptcy.

One copy of the lease (the *original*) is signed, sealed, and delivered (D 9 (2)) by the lessor, and handed over to the lessee as evidence of his *title* to the leasehold interest. The other copy (the *counterpart*) is signed, sealed, and delivered by the lessee, and handed over to the lessor as evidence of his entitlement to the rent and to the performance of the covenants by the lessee. The counterpart requires a stamp (impressed by the Stamp Duty Branch of the Inland Revenue) of only five shillings, but the original must be stamped at the rate of £1 for every £50 of the rent (in addition to £2 for every £100 of the premium, if any).

(*Note. Landlord and Tenant.*—In earlier editions of this work much space was devoted to the subject of *Rent Restriction*. Between the First World War and the summer of 1957 the common law rules applicable to the landlord and tenant relationship were modified on innumerable occasions by Acts of Parliament, particularly the Rent Restrictions Acts. These Acts, because of the shortage of housing accommodation, provided an elaborate code to prevent landlords from taking advantage of that shortage, they "controlled" all dwellings up to a rateable value of £100 a year by providing, broadly speaking, certain limits beyond which rents could not lawfully be increased, and by giving tenants security of tenure after their contractual tenancies came to an end.

The subject has now lost a good deal of its importance, since, by the Rent Act, 1957, such control is abolished (*a*) for new lettings, and (*b*) for old lettings of dwellings above a rateable value of £40 a year in London and £30 elsewhere, and power has been reserved to the Minister of Housing to decontrol those still controlled, as and when he thinks fit, by ministerial order, without further legislation. So many complications are likely to arise in the transitional period that landlords and tenants will be wise to seek legal advice in cases of doubt. To attempt to summarise the position at this stage would be confusing and dangerous in the extreme.)

3. Mortgages.—The word *mortgage* is Norman-French, its literal meaning is "dead pledge." The process of mortgaging land and buildings is roughly analogous to that of pawning a piece of jewellery as security for a loan of money—with the important difference that the land cannot, of course, be physically handed over to the lender (as can the jewellery) to be kept in his custody until the loan is repaid. But a pledge and a mortgage have this in common—that the parties intend no change of *ownership*; the *borrower* (or *mortgagor*) is and remains *owner* of the property *after, as well as before, the transaction.* In exchange for a loan of a certain sum, the lender (or mortgagee) temporarily enjoys a *charge* upon property worth (it may be) much more than that sum, as *security* for the repayment of the loan, with the stipulated interest, at the stipulated time. The *borrower* is still the property-*owner*.

Because of the essential immoveability of land, the mortgage transaction is effected by a *mortgage deed*, which sets out the terms on which the loan is granted. Generally speaking, the borrower (or mortgagor) is permitted to remain in *possession* of the mortgaged property unless and until he fails to pay an instalment of interest or to repay the capital when called upon, or unless and until he breaks some condition of the mortgage deed. In early times such failure was often the signal for the lender (or mortgagee) to oust him *permanently* from possession, and even to deprive him of *ownership* of the property. But the courts of equity (as we have seen, D4 (2)) gradually evolved the rule that it was unconscionable for the lender to enrich himself, at a low cost to himself, from a transaction in which the intention of the parties was to *pledge the property temporarily* as a *security*, not to sell it permanently for a small sum. Hence was evolved the concept known as the *equity of redemption*—the rule that, even *after the legal date* fixed by the deed for repayment of the loan and for freeing the property from the mortgage, the borrower should still remain entitled to *redeem* the property (*i.e.*, to free it from the charge) by tendering to the lender the balance of the loan, with all interest and costs to date, and that the lender should thereupon be *bound* to give the borrower full and unfettered rights over the property, free from all the conditions of the mortgage, and in the same state as it was in originally. The lender (or mortgagee) must get no collateral (or additional) advantage of a permanent kind once the loan, interest, and costs were paid off, and this is still the law today.

The law, as stated above, has established the principle that the borrower who mortgages his freehold or leasehold interest, as security for a loan of money, shall not be deprived of his ownership, but shall retain such ownership after the execution of the mortgage deed. That deed is, in the first place, a *contract or agreement* under which the borrower promises to repay the loan to the lender, with interest at a certain rate, in one sum or by instalments, and meanwhile, for the lender's protection, to keep the property insured, in proper repair, and so forth. But that is not all: it is clearly important that the lender (the mortgagee) should, in addition, be granted an interest *in the property itself*—an interest which will enable him to take actual *possession* of the property, if need be, to enforce his rights, much as the pawnbroker has the right to *possession* (though not *ownership*) of the pledged article until the loan is repaid.

The Law of Property Act, 1925, devised a method of giving the lender (the mortgagee) a legal estate in the property while still preserving the rights of ownership of the borrower (the mortgagor). That Act provides that the grant of a mortgage of land, in *whatever form* it is effected, shall confer upon the lender (the mortgagee) *a term of years absolute*—*i.e.*, a *legal estate* in the *land itself*, which the mortgagee can deal with by sale, and which will be transmitted, as an interest in land, to his legal personal representatives upon his death. It is further provided that, on the final discharge of the mortgage (*i.e.*, the repayment of the loan, with all interest and expenses due to the mortgagee), that term of years shall *cease and be extinguished*, the mortgagor thereafter continuing to hold his freehold or leasehold estate *free from the mortgage term of years*, and free also from all the conditions of the mortgage deed.

In such a scheme it was necessary to distinguish the term of years conferred by the mortgage from any term of years absolute which might be or might have been conferred upon a lessee or underlessee by way of a lease or tenancy (see above, *Leaseholds*). For the purpose of such distinction the Act provides that, if the mortgagor's legal estate is a *freehold*, the mortgage deed confers upon the mortgagee a *term of 3000 years*, thus leaving to the mortgagor a legal *reversion* to commence after the expiration of that term (since the freehold estate is not limited to expire at any particular time). And if the mortgagor's legal estate is a *leasehold*, due to expire at the end of a fixed period, the mortgage deed confers upon the mortgagee a *term of years to expire ten days before* the leasehold term, thus again leaving the mortgagor with a legal reversion (in this case of ten days only).

In this way each party has a legal estate in the *land itself*, quite apart from the *contractual* rights and obligations in regard to the loan, which can be enforced by and against him *personally*. The mortgagor can sell his freehold *subject to the mortgage term* and the obligations of the mortgage deed; the mortgagee can *sell his mortgage term* with the benefit of the rights that go with it. The sale of a freehold (whether subject to a mortgage or not) is effected by a deed called a *conveyance*, the sale of a leasehold is effected by a deed called an *assignment*. The mortgage term can be dealt with in a deed called a *transfer of mortgage*. In every case the purchaser takes over the vendor's legal estate in the land, subject to, or with the benefit of, the personal obligations or rights in the original deed. In case of the death of the mortgagee or mortgagor, the legal estate in question, and the rights or obligations, are transmitted to his personal representatives.

Finally, it should be mentioned that, as an additional safeguard, the *title deeds* (evidencing the mortgagor's freehold or leasehold title) must be handed over to the mortgagee when the mortgage deed is executed, as part of the latter's security. The mortgagor must take care to get them back when he *redeems* the property by paying off the loan, interest, and expenses.

4. Title.—(a) *Evidence of title.*—Before freehold or leasehold property changes hands, it is the duty of the purchaser's solicitor to *investigate title*—*i.e.*, to satisfy himself that the vendor has a proper title himself and a proper right to convey or assign. Generally speaking, the purchaser's solicitor must go through the deeds (evidencing sales, transmissions on death, grants of leases, grants and redemptions of mortgages) for at least *thirty years back*; he must check every step in the *devolution of title* (*i.e.*, every change in ownership) and make *requisitions* (*i.e.*, demand explanations) on any point which is doubtful. This is still the system over the greater part of the country.

(b) *Registration of Title.*—With a view, however, to simplifying such procedure the Land Registration Acts have provided for a different system. In areas to which an Order in Council has made the system applicable, *registration of title* is *compulsory* upon any sale of freeholds, or of leaseholds having more than forty years to run. Registration is effected in the following way: the Government lawyers at H.M. Land Registry, in Lincolns Inn Fields, London, W.C. 2, investigate the title of every freehold or leasehold sold after the appropriate date, *once and for all*. If they are satisfied that it is in order, they register the owner as *registered proprietor* of the land with *absolute title* to his freehold or *good leasehold title* to his leasehold. (These kinds of titles indicate that the title is unexceptionable, but if there is a slight doubt the proprietor may be granted a *qualified title*; and if he is in possession of the land he may be granted a *possessory title*, which signifies little more than the fact of possession. The Chief Land Registrar is empowered, however, to convert both qualified and possessory titles into absolute or good leasehold titles, after fifteen years in the case of freeholds, and after ten years in the case of leaseholds.)

The Land Registry issues to the registered proprietor a *land certificate*, certifying (on behalf of the Government) that a registered title of the appropriate kind has been granted. In any further transactions relating to that particular land the purchaser's solicitor need not concern himself with the original deeds save in exceptional cases; he can generally rely upon the certified statements made in the *land certificate*, on which the name of the new registered proprietor is entered by the Land Registry officials when a *transfer* in his favour, or the grant of a lease to him, is lodged at the Registry. There are appropriate sections in the land certificate for

registration of a mortgage and the particulars of the mortgagee for the time being.

At the time of going to press, registration of title is compulsory in the Counties of London, Middlesex and Surrey, in the County Boroughs of Eastbourne and Hastings, in the City of Oxford, and in the whole of Kent. also the Cities of Oldham, Leicester, Manchester and Salford, Huddersfield, Blackburn and Reading. But any landowner elsewhere may voluntarily apply for registration of his title.

5. **Joint Ownership.**—If two or more persons are the owners of freehold or leasehold property, that does not mean that A owns one part of the land and buildings, and B and C other parts; the effect is that all of them *jointly own the whole.* (The analogy will be clear if the reader considers the case of a motor-car owned jointly by A, B, and C, clearly *all three own the entire car* between them, it cannot be said that A owns the engine, B the chassis, and C the body.) The Law of Property Act, 1925, recognises such joint ownership of land by means of a device known as a *trust for sale.* The respective rights of A, B, and C (equal or unequal) can be fully enforced only if and when the property is *sold* and the net proceeds of sale, in money, divided up in the proper proportions, and any or all of the joint owners can insist upon such sale or division for the purpose of obtaining their proper shares. But, while the property remains unsold, all the joint owners have rights according to the proportions of their shares. If, for example, the property is let, the net rents, after paying for repairs and other expenses, must be divided between them in those proportions. Up to four persons can jointly own a freehold or leasehold legal estate in land; if more than four are entitled to the *beneficial interest*, then four of their number only must hold the *legal* estate, and *equity* will enforce the *beneficial rights* of all against the legal owners. A purchaser from joint owners of the legal estate is concerned only with the latters' *legal title* , provided he hands over the purchase-money to them (not being less than two), or somebody authorised by them, *the purchaser is not responsible* for what they may do with that money. If those legal owners, from whom the purchaser buys, fail to pay over the proper shares to those *beneficially interested*, it is for the latter to enforce their rights against the vendors, who have sold the legal estate, by action in the Chancery Division, the guardian of equity. The purchaser's title to the land itself is not affected by the vendors' failure properly to carry out the terms of the trust for sale, so long as the *legal estate* has been properly transferred to him and he has paid the purchase-money to *not less than two* legal owners.

III. Property Other than Land (Moveables)

1. **Chattels.**—Chattels are *concrete things* which can be the subject of ownership, other than land or buildings, and other than objects so closely affixed to land or buildings that they are regarded as part thereof (*e.g.*, growing crops and trees, or "landlord's fixtures" built into some structure or so closely attached that they cannot be removed without serious damage to the structure).

In the ordinary way chattels can be *sold* or *given away* without any special legal formalities—merely by *physical transfer*—*i.e.*, by the owner handing them over to somebody else. If a chattel is to be *mortgaged* as security for a loan, the procedure differs according to whether the person pledging it (the borrower) is or is not to retain *possession* of the chattel. (His *ownership*, in either case is not disturbed.)

(*a*) If, as happens when an article is *pawned*, the borrower is not to keep the article in his possession, he hands it over to the pawnbroker, who hands him in exchange the agreed loan and a *pawn-ticket*. On production of the pawn-ticket, and the repayment of the loan with the stipulated interest, the borrower is entitled to receive the article back. (Provision is made by law for cases where the borrower defaults in payment, or where an unreasonable time elapses before he seeks to *redeem* what he has pledged.)

(*b*) If, however, the arrangement is that the *borrower* is to *retain possession* of the mortgaged article (as may happen if he borrows from a *moneylender* on the security of his furniture), then the borrower must execute and hand to the lender a document called a *bill of sale*. The law relating to such a document is extremely complex; but the most important provision is that the lender cannot enforce his rights unless he *registers* the bill of sale, at the Bankruptcy Court, in a register which any member of the public can inspect for a small charge. If then some member of the public desires to purchase the article from the person in whose possession it remains, but has reason to suspect that that person, though he may be the owner, has mortgaged it to a money-lender, it is open to the proposing purchaser to inspect the *register of bills of sale* to satisfy himself on the point. If he finds an entry against the owner's name, he will be wise not to proceed with the transaction. If he finds no such entry, and has no reason to believe the owner to be bankrupt, he can usually assume that there is nothing to prevent the person in possession from passing a good title to him.

2. **Things in Action.**—These (see D16 (1)) are *intangible rights* which can be owned and dealt with but, because of their abstract nature, cannot be *physically* transferred. If Brown owes Jones £50, Jones (the creditor) can transfer to Robinson the right to collect the £50 from Brown. Jones does this by a document called an *assignment* of the debt and (most important) by giving *written notice* to Brown (the debtor) that Robinson is now the creditor instead of Jones.

Similarly, if Jones owns ten shares in Brown & Co., Ltd., Jones will hold a *share certificate*—*i.e.*, a document certifying the amount of his shareholding. He has certain rights in the company, but these depend upon the company's *memorandum and articles* (D 8 (2)) and upon the *registration* of his name in the company's register of shareholders. The share certificate is only *evidence* of his rights—it is not in itself a piece of property, and the physical handing over of the certificate will effect nothing unless Jones executes a *share transfer* in Robinson's favour and Robinson sends it to the company for registration, together with the old share certificate in Jones's name. After *registration* of Robinson's name, the company will destroy the old certificate and issue a fresh one to him.

Again, if Jones has insured his life with the Brown Life Assurance Society, he will have received a *policy* which is *evidence* of the right of his legal personal representatives to be paid £1000 on Jones' death. If Jones wishes, during his lifetime, to transfer that benefit to Robinson, he can do so, but it will not suffice for him merely to hand Robinson the policy. To transfer the *rights* under the policy he must execute an *assignment* in which it is stated that Jones, being the policy-holder and entitled to certain rights thereunder, now *assigns* those rights to Robinson. But no transfer of those rights will have been effected until Robinson has *notified* the Assurance Society of what has been done and sent it the policy and the assignment for *registration* in its books.

These examples illustrate the principle, set out in the Law of Property Act, 1925, that an *unconditional assignment*, in writing, by a person (the assignor) entitled to any debt or other thing in action, in favour of another person (the assignee), if *notice in writing* is given *to the debtor* or other person on whom the obligation rests (in the above examples, to Brown, the Company, and the Assurance Society), shall entitle the assignee to all the assignor's rights, including the right to enforce those rights by action in the Courts, without calling upon the co-operation of the assignor in whom the right to the debt, or other thing in action, was originally vested.

DIVORCE AND OTHER MATRIMONIAL CAUSES

1. HISTORICAL SKETCH

The anomalies in this branch of the Law of England, and the legalistic attitude of the Courts to the subject, are principally due to historical reasons. For centuries the Church of Rome was the supreme ecclesiastical authority, and the law of that Church (Canon Law) applied to *matrimonial causes*—that is to say, disputes relating to any marriage and the mutual rights and duties of the spouses. Marriage was *indissoluble*—that is, there was no such thing as divorce in the modern sense of *breaking the legal tie* But the Ecclesiastical Courts, which alone administered the matrimonial law before 1858, might for certain reasons grant a *decree of nullity* (a declaration that a particular "marriage" was null and void). In other cases they might grant what is now called a *legal separation* (known, in those days as a "divorce *a mensa et thoro*," *i e.* banishment from bed and board); this latter decree, however, *did not dissolve* the marriage bond, but merely gave judicial sanction to the spouses' living apart from each other, and regulated the terms of the separation After the Reformation the Ecclesiastical Courts continued to deal with matrimonial causes on the same legal principles as before.

As a result of the Acts of Supremacy passed in the reigns of Henry VIII and Elizabeth I, the Sovereign was declared to be the supreme governor of the Realm in all spiritual and ecclesiastical, as well as temporal, causes This royal supremacy, exercised constitutionally through Parliament, was part of the law of the land; since there was no limitation upon the power of Parliament (see D5), special Acts were passed, from time to time, to effect that which neither the Ecclesiastical nor the Civil Courts then had jurisdiction to do, *viz.*, to break the marriage tie itself A divorce of this kind, known as "divorce *a vinculo matrimonii*" (a divorce from the marriage bond) was rare, for the procedure was cumbersome and expensive. Except by the passing of a special Act of Parliament, there was no means of getting a marriage dissolved before the year 1858.

The Matrimonial Causes Act, 1857, transferred the jurisdiction in matrimonial matters from the Ecclesiastical Courts to the new Civil "Court for Divorce and Matrimonial Causes"; but perpetuated the old ecclesiastical practice with regard to nullity suits and judicial separation (formerly known as "divorce *a mensa et thoro*"). Apart from this rearrangement, the Act took the revolutionary step of conferring upon this Court a new judicial power—that of granting a *divorce in the modern sense* of a complete *dissolution of marriage* As we have seen (D5), the Supreme Court of Judicature Act 1873, and subsequent legislation, set up one single High Court of Justice, of which the Probate, Divorce, and Admiralty Division formed part, taking over (with other work) the jurisdiction which had been conferred in 1857 upon the "Court for Divorce and Matrimonial Causes." This jurisdiction remains in the hands of the Probate, Divorce, and Admiralty Division to-day Great changes have been effected *by statute* (notably in 1923, 1925, 1937, and 1950) extending the grounds for divorce and the jurisdiction of the Court; but in the *interpretation and adaptation of principles* the great body of *case law* (see D4), which enshrined the principles and practice of the old Ecclesiastical Courts, is not without its influence to-day The principles of equity (see D4), however, have not modified the strict legalism of this branch of the law; *equity has no application to the law of matrimonial causes* (except for resort to *injunction* (see D11) for the protection of the wife's person or property).

2. POWERS OF INFERIOR COURTS—SUMMARY JURISDICTION

Concurrently with the jurisdiction of the Divorce Division of the High Court, Magistrates' Courts now have power, by virtue of the Summary Jurisdiction (Separation and Maintenance) Acts, 1895 to 1949, to grant relief to the injured spouse in certain cases of matrimonial misconduct. The procedure is simpler, quicker, and less expensive than in the Divorce Division of the High Court. A Magistrates' Court may grant a *separation order* (which has the same effect as a High Court decree of judicial separation) and (in appropriate cases) an order for *legal custody of any child under sixteen* to either spouse. Where a *wife* is the applicant, a Magistrates' Court may also make an *order for maintenance* (maximum, £5 a week for the wife and 30s. a week for each child in her legal custody). Applications by a *husband* are limited to cases (1) where the wife is an habitual drunkard or drug-addict, (2) where she has been guilty of persistent cruelty to the children; or (3) where she has been guilty of adultery In case (1) the Court may order (with the wife's consent) that she be committed to and detained in "a licensed retreat for inebriates"

A wife may apply for relief in any of the following cases:

(1) Where her husband has been convicted summarily (*i e*, in a Magistrates' Court) of an aggravated assault upon her.

(2) Where her husband has been convicted on indictment (*i e.*, by a jury) of an assault upon her, and sentenced to a fine exceeding £5 or to imprisonment exceeding two months

(3) Where she has been deserted by her husband.

(4) Where her husband has been guilty of persistent cruelty to her or her children.

(5) Where her husband has been guilty of wilful neglect to provide reasonable maintenance for her or her infant children whom he is legally liable to maintain.

(6) Where her husband is an habitual drunkard or a drug-addict.

(7) Where her husband, while suffering from a venereal disease, and knowing that he was so suffering, insisted on sexual intercourse with her

(8) Where her husband has compelled her to submit to prostitution (or been guilty of such conduct as was likely to have, and has had, the same result).

(9) Where her husband has been guilty of adultery.

The Court may order that the *costs* of any application shall be paid by either party, as it thinks fit.

The general rule is that an *application* must be made *within six months* of the ground of complaint;

but this time limit does not apply to such continuing offences as desertion (see below) or wilful neglect to maintain. An application may be made to any Magistrates' Court acting within the district in which the cause of complaint wholly or partly arose, or in which the wife or husband ordinarily resides.

These "domestic proceedings," as they are termed, may be heard before one stipendiary (legally qualified magistrate) or two or three justices of the peace, including, so far as practicable, both a man and a woman. The *hearing* is *in private*, the public being excluded, and newspapers are prohibited from publishing details; "domestic proceedings" must be dealt with separately from other matters, and reports from probation officers may be received on the subject of any attempted reconciliation or on the means of the parties. In general, the magistrates should apply the same general principles as are applied in the Divorce Division; lay justices of the peace are advised on the law by their legally qualified clerk.

A *Magistrates' Court*, however, has *no power to grant a divorce* or *to annul a marriage*, the sole jurisdiction to make such a decree is in the hands of the Divorce Division of the High Court of Justice

An order may be enforced by committing the husband to prison if his failure to comply with the order is shown to be due to wilful refusal or culpable neglect.

No order is enforceable while a wife is *residing with her husband*, and *no order* may be made on the application of a wife where it is proved that she has been *guilty of adultery*, unless the husband condoned or connived at (see below), or by his wilful neglect or misconduct conduced to (*i e*, tended to lead to), the adultery An *order already granted* will be *discharged* (*i e*, its effect will be terminated) on *proof of the wife's adultery*, or on proof that she has *voluntarily resumed cohabitation* with her husband

If a matrimonial cause is pending in the Divorce Division of the High Court, no application for a separation or maintenance order ought to be dealt with by a Magistrates' Court And a Magistrates' Court may refuse to make any order when the suit in question would, in its opinion, be more conveniently dealt with by the Divorce Division.

Appeals. A Magistrates' Court has power "to state a case," upon *a point of law* (not a question of *fact*) arising on the application, for decision by a Divisional Court consisting of two or more judges of the Divorce Division. And an appeal from a Divisional Court lies to the Court of Appeal, by leave of either the former or the latter.

3. MATRIMONIAL CAUSES in the DIVORCE DIVISION of the HIGH COURT

(1) Constitution of the Court

The President of the Probate, Divorce, and Admiralty Division and not less than three other High Court Judges attached to that Division are the permanent judges for Matrimonial Causes. They sit both at the Royal Courts of Justice in London and at Assizes. Certain subsidiary duties are performed by the seven Registrars of the Principal Registry of the Division at Somerset House, and by District Registrars in the principal cities of England and Wales.

(2) Practice and Procedure

In contrast to "domestic proceedings" in Magistrates' Courts, the *Judges* of the Divorce Division sit normally in *open court*, though they have power to sit *in camera* (in private) where the ends of justice so require. In *nullity proceedings*, however it is provided by statute that evidence on the question of *sexual incapacity* must be heard *in camera* unless the Judge is satisfied that the ends of justice require such evidence to be heard in open court. Press publicity is limited by statute to certain matters, and the publication of indecent matter may give rise to prosecution, in *any* matrimonial proceedings.

In general, practice and procedure in the Divorce Division are governed by statute, by rules of Court framed by a judicial committee under statutory authority and by the principles and practice of the old Ecclesiastical Courts—except in proceedings for dissolution of marriage, which the old Courts could not entertain (see para. 1 above)

(3) Relief and Grounds for Relief

(a)—**Nullity of Marriage.** The Court has power to declare a "marriage" null and void in two main classes of case

(i) "*Marriages" Void from their Inception*—*i e*, where one of the parties had *another husband or wife living* at the time of the ceremony; where there was a *mistake* as to the *nature* of the ceremony, or the *identity* of the other party, where one party had been declared of *unsound mind* and was detained as a lunatic at the time of the ceremony, where the parties were within the *prohibited degrees* of relationship (*e g*, brother and sister, or uncle and niece); or where the *ceremony was not in due form*, or was a mock "marriage."

(ii) *Marriages which are Voidable*—*i e*, which stand good unless and until one party or the other ("the Petitioner") successfully petitions the Court for annulment—*i e*, where either party was sexually *impotent at the date of the ceremony*, where either party has wilfully *refused to consummate* the marriage, where the marriage was *induced by threats* or fear or duress (*i e*, force), or where one spouse was *intoxicated* at the time of the ceremony

The Act of 1950 has (somewhat illogically) added certain other grounds. (*a*) where either party was, at the time of the ceremony, in fact of *unsound mind* but had not been declared so, or was then a *mental defective*, or then subject to recurrent fits of *insanity or epilepsy*; (*b*) where the other spouse was, at the time of the marriage, suffering from *venereal disease* in a communicable form; and (*c*) where the wife was, at the time of the marriage, *pregnant by some person* other than the petitioning husband. But in these last cases (*a*), (*b*), and (*c*) the Court must not grant a decree unless it is satisfied that the petitioner was, at the time of the marriage, ignorant of the facts alleged; that the proceedings were instituted within a year of the marriage, and that there has been no sexual intercourse between the parties, with the consent of the petitioner, since he or she discovered that there were grounds for a decree of nullity.

Where a "marriage" is *void* (see above) the law regards it as *never having taken place* at all. Where it is *voidable*, the decree *annuls the marriage retrospectively* from its inception; but certain transactions between the parties while they actually

remained married are validated, and the Court has power to order maintenance for the woman; and *any child* who would in the normal way have been the legitimate child of the parties *remains legitimate*, notwithstanding the annulment.

Sterility—*i.e.*, inability to produce children—is not, in itself, a ground for annulment of the marriage. If the *impotence* of one spouse appears to be *curable* without danger the Court may, before pronouncing a decree, require that opportunity for *cure* be first given. If he or she *refuses to undergo examination or treatment* the Court may infer, after hearing the other party's evidence, that impotence exists. The petitioning husband or wife may ask for a nullity decree on the ground of *his or her own impotence*, provided he or she did not know of it at the time of the marriage.

Apart from the one-year rule (mentioned in the last paragraph but two) in certain cases, delay (however long) in petitioning for nullity is no bar to the grant of a decree.

(b) Divorce.—(i) *Its Nature and Purpose.*—Divorce means the *breaking of the legal tie* of marriage by a decree of the Court. There is much controversy on the subject, some of it ill-informed, and much of it tinged with emotion and prejudice. It is not the purpose of this sub-section to take sides in the controversy, but (so far as possible) to remove misconceptions and to set out the various points of view.

We have to start by facing the unpalatable truth that *some marriages do break down* in fact. The symptoms of break-down may be continual strife, and sometimes violence, between the spouses, so long as they continue to live together, or there may be an actual breaking-up of the home because one or the other finds the situation intolerable and leaves. The function of the law should be to deal with this state of affairs as best it can, paying due regard: (*a*) to the interests of the children (if any), who are innocent parties to the dispute; (*b*) to the interests of the spouses and of any third party involved; (*c*) to the interests of public decency and the safeguarding of family life generally.

The problem has suffered from over-simplification by the Press and the protagonists on either side. Sometimes it is represented (quite inaccurately) as a conflict between those who want divorce to be "easier" or "harder" to obtain. Sometimes it is said that divorce as an institution is "causing the break-up of family life." This is a superficial view, ignoring the true nature of the problem, and confusing effect with cause. Happily married couples do not seek divorce. Divorce is the drastic *remedy* provided by the civil law in the case of a marriage which has already *broken down in fact*; the availability of divorce does not bring about the break-down, any more than the availability of surgical treatment can be said to bring about ill-health. A marriage may break down—that is to say, the "kernel" of the marriage, the mutual respect and affection between the spouses, has withered away; only an empty shell—the legal tie—continues to subsist between them. How should this situation be dealt with by law?

It is common ground, among both the upholders of the orthodox view and those who advocate reform, first, that every possible effort should be made, by private individuals and public institutions, to effect a reconciliation, if at all possible. Such efforts are favoured by the law, and excellent work is done to this end by religious organisations, medical men, probation officers, lawyers, and such institutions as the Marriage Guidance Council.

Secondly, it is common ground that, if such efforts are unsuccessful and the *breach proves irreparable* in fact, the interests of the children (if any) should be paramount, and no pains should be spared to secure their proper care and maintenance. This is laid down by law; the Judge in a matrimonial cause may take the initiative in providing for the custody, maintenance, and education of the children, or for placing them under the care of the Chancery Division (see D5); whether the initiative is taken by the Judge or by one of the parents, the welfare of the children is the *paramount consideration*, irrespective of the rights and wrongs as between the parents. Nobody will deny that, once the marriage has broken down *in fact*, the children will suffer to some extent; but it does not follow that they would suffer less if the legal tie between the parents were preserved, or if the home, with its atmosphere of strife, and perhaps of violence, were kept together at all costs—even assuming such a thing were possible. A divorce may not be granted unless the Judge is satisfied that all possible arrangements have been made for the care and upbringing of the children (D31).

It is at this point that the main controversy begins. Where the "kernel" of the marriage has withered away, should the "shell"—the legal tie—be preserved or discarded? And if discarded, then in what circumstances and on what conditions? The present answer of the law is a not altogether satisfactory compromise.

The Christian Churches declare that marriage is not merely a civil institution but a religious sacrament, and the Roman Church regards it as indissoluble. This last is a matter of religious dogma and belief, not a question for rational argument. It is a view as deserving of respect as any other, but, as we have seen, it was abandoned by Parliament a century ago, and is unlikely to be reinstated in the civil law of England. Many churchmen regard this view as binding on their consciences, but it is no longer the law of the land. For better or worse, a marriage can now be legally dissolved, leaving each party free to contract another union if he or she so desires. On what basis, then, ought such dissolution to be granted?

This is the second stage of the controversy. The conventional view, the attitude of the present law, is that a decree of divorce can, and ought to, be granted solely as a result of some *matrimonial misconduct* by the "guilty" party, entitling the "innocent" party—and only the "innocent" party—to go to the Court for relief. According to this view the decree of divorce (though in law a merely civil remedy) is regarded virtually as in the nature of a *penalty* upon the "guilty" party for his or her wrongdoing—a view that has survived from biblical times. The reformers consider this an anachronism and an anomaly, pointing out: (*a*) that in those times (as is the case under Jewish and Islamic law to-day) it was only the husband who could divorce his wife (not *vice versa*)—a step which was then a very severe punishment, since divorce meant, for the woman, disgrace, degradation, and poverty; whereas there is to-day little or no economic penalty or social stigma upon the "guilty" spouse, who is frequently no less—and often more—desirous than the "innocent" spouse of obtaining his or her freedom. The reformers further emphasise: (*b*) that the matrimonial law has never pretended to identify itself wholly with the doctrines of the Church, for example, the Book of Common Prayer declares, of marriage, that "first, it was ordained for the procreation of children"; yet not even the Ecclesiastical Courts went so far as to annul a deliberately childless marriage, and under the present law a refusal to have children is not a matrimonial offence and involves no penalty. Finally, (*c*) the reformist view is that the essence of the married state—the "kernel"—is the mutual respect and affection between the spouses; once that "kernel" has withered away and the marriage has *irretrievably broken down in fact*, the preservation of the legal tie is a mere pretence; the breaking of that legal tie, from the point of view of public decency, should be regarded as the and proper result of the break-down of

the essence of the marriage, or the break-up of the marital home. Under the present system, a refusal by the "innocent" party to take proceedings for divorce, however malicious his or her motive for such refusal, cannot be questioned, and this makes for irregular unions and illegitimate births; on the other hand, the law's insistence that there must be an "innocent" and a "guilty" party inevitably induces two spouses, who find their union intolerable, to resort to unworthy subterfuges; under a more rational system (such as obtains, for example, in the Scandinavian states) both parties might amicably join forces to have the marriage dissolved, once it was quite clear that reconciliation was out of the question.

All these view-points, and others, were considered by the Royal Commission which heard evidence in 1951-55 and made certain recommendations in 1956; its Report, however, was by no means unanimous, and the law, by and large, remains unchanged. That is to say—only the "innocent" party, except in "discretion cases" (D29 (1)), can take proceedings for divorce against the "guilty" party; the law has sternly set its face against "divorce by consent" in any circumstances—if such consent comes to light.

(ii) *Grounds for Divorce.* The *Petitioner* (*i.e.*, the husband or wife who is *asking the Court for a divorce* against the other spouse) may present a petition on the ground that the *Respondent* (the other spouse):

(*a*) has since the celebration of the marriage *committed adultery*;

(*b*) has *deserted* the Petitioner *without cause* for at least *three years* preceding the presentation of the petition,

(*c*) has since the celebration of the marriage treated the Petitioner with *cruelty*, or

(*d*) is *incurably of unsound mind* and has been *continuously under care and treatment for at least five years* immediately preceding the presentation of the petition. (*See also* D31 (2).)

Further, a *wife* may petition for divorce on the grounds that:

(*e*) her husband has, since the celebration of the marriage, been guilty of *rape, sodomy*, or *bestiality*.

Finally, to cover those cases where one of the spouses has disappeared and not been heard of for many years:

(*f*) any married person who alleges that reasonable grounds exist for *supposing the other party to be dead* may petition the Court *to have it presumed* that the other party is dead and *to have the marriage dissolved*.

No petition for divorce on any ground may be presented *until the expiration of three years* from the date of the marriage unless a Judge is satisfied that there is a case of *exceptional hardship* upon the Petitioner or *exceptional depravity* on the part of the Respondent. Whether there is such a case is a question for the Judge's discretion upon the evidence brought before him.

As to the above-mentioned grounds for divorce:

(**a**) ***Adultery*** **means** ***voluntary sexual intercourse*** **between a husband and a woman who is not his wife, or between a wife and a man who is not her husband.** (A woman who has been raped—*i.e.*, forced to have intercourse with another man against her will—is not guilty of adultery.) For obvious reasons, *direct evidence* of the act of adultery is rare, and the Court may infer from circumstantial evidence that adultery has taken place.

(b) *Desertion* means, primarily, the *intentional permanent abandonment*, by one spouse of the other, *without that other's consent*, and *without reasonable cause*. Therefore there is *no desertion* in such cases (for example) as: (i) where a husband *cannot* live with his wife because he is serving a sentence of imprisonment; (ii) where a husband leaves his wife for a *short time* for necessary business or family reasons, *intending to return to her*, (iii) while a *separation continues with the consent of both parties*; (iv) where the spouse who abandoned the other had *just cause* to do so.

Indeed, in certain cases under (iv) the doctrine known as constructive desertion may apply *against the other spouse*, if he or she has (figuratively speaking) *driven the first spouse away*. *Constructive desertion* means, not "desertion" in the literal sense of walking out of the matrimonial home, but conduct on the part of a husband which is intended to force, and virtually forces, his wife to leave him, or *vice versa*. Thus, if a husband brings his mistress to live with him in the matrimonial home and, as a result, his wife leaves him, not only is the wife innocent of desertion in the legal sense, but the husband is himself guilty of constructive desertion; it will be presumed against him that he intended to terminate his marital association, and he has in fact *carried out that intention*. Such a case illustrates the principle that there are *two elements* in the legal meaning of *desertion*—the *act* of physical separation and the *intention* to bring normal married life to an end.

In order to bring about desertion it is not necessary that the spouses should cease to live under the same roof; "desertion is not withdrawal from a place, but from a state of things." It is sufficient that the Respondent (the "guilty" spouse) has withdrawn from, or forced the other to withdraw from, *cohabitation*—*i.e.*, from sharing a common "home" in the full sense of the word. A wife "deserts" her husband if she refuses (against his will) to share his room, to take her meals with him, and to perform the usual duties of a wife. On the other hand, the mere refusal of sexual intercourse, in itself alone, does not amount to desertion.

It should also be noted that desertion is not a single act but a continuous state of affairs. The Petitioner must prove beyond reasonable doubt *that desertion without cause continued* during the entire period of *three years* required by law as the basis of a divorce petition. Although (see above) desertion in the legal sense must be *without the consent* of the petitioning spouse, recent judicial decisions have tended to dispense with the requirement that the deserted party must prove a *continuing desire* for the deserting party to return, and a *continuing willingness* to receive and reinstate the deserting party, during the *entire period of three years* preceding the commencement of proceedings; in other words, once the latter party's *original act and intention of deserting* has been proved, that intention is *presumed to have continued*, unless there is evidence to the contrary. But any kind of *agreed separation* is fatal to the case, whether the agreement be in writing, by word of mouth, or implied by conduct. An agreement, however, by a husband, who is *already living apart* from his wife, to *maintain* her and the children does not constitute a separation by agreement, unless there is evidence that the *wife actually consented* to his leaving her. A *maintenance order* made by a Magistrates' Court (see (D24 (2)) does not necessarily prevent the period of

desertion from running, unless the order contains a clause, deliberately inserted, to the effect that "the parties shall no longer be bound to cohabit."

If the deserting party makes an *offer to return* to the matrimonial home it is the duty of the other party to receive him (or her) back and to resume normal married life together, *if the offer to return is genuine* and if no other matrimonial offence (such as adultery or cruelty) has been committed by the deserting party. Whether such an offer is "genuine" is a question of fact, to be decided on all the evidence; it will generally be a wise safeguard for a deserted party who receives such an offer to *take legal advice* before accepting or rejecting it, for if rejection of the offer subsequently proves to have been unjustified, he (or she) may become the deserting party. This situation, again, arises from the legal view that "desertion" consists of two elements—the *act* and the *intention* of deserting.

An *honest and reasonable belief*, by one spouse, that the other spouse has committed, or is committing, adultery, if such a belief is induced by the other spouse's conduct, may be "just cause" for the first spouse to refuse cohabitation, and prevent him (or her) from being regarded as the deserting party.

(c) *Cruelty* is not defined by statute, but has been decided, in reported cases, to mean conduct causing danger to life, limb, or bodily or mental health, or giving rise to a reasonable apprehension of such danger (The term "Mental Cruelty" is unknown to English law; but there may be *cruelty* in the legal sense *without physical violence*.) The Courts have refused to commit themselves to a comprehensive definition; *every case* must be considered on its *own facts* in the light of the whole history of the marriage. One single act, even of violence, can seldom be regarded as "cruelty"; but the conduct complained of must be of a *grievous nature*—not mere conduct which (however reprehensible) may be regarded as "part of the wear and tear of married life." In order to constitute cruelty, the conduct must be *intentional* on the part of the guilty spouse, *aimed at* the injured spouse, and calculated to break the latter's *health or spirit*. An *insane person*, who does not understand the nature and quality of his acts, and so cannot form the necessary "intention" (see D8), *cannot be guilty of cruelty*.

Drunkenness, in itself, is *not* cruelty; but if it is so *persistent*, or its effects so inevitably *distressing* to the other spouse, as to *threaten his or her health*, it may amount to cruelty. Similar considerations apply to persistent refusal of sexual intercourse, excessive sexual demands, or sexual malpractices either forced upon the other spouse or committed with third parties.

A *divorce petition* based wholly or partly on cruelty must *set out specifically the acts* complained of, evidence of which is to be given at the trial (This ensures that the Respondent knows the details of the case he has to meet.)

(c) **Restitution of Conjugal Rights.**—Either spouse may petition the Court for such a decree where the other spouse has "wrongfully withdrawn from cohabitation" (see above). *Willingness to return* to cohabitation, *if genuine*, or *proof of just cause* (see above) for refusal are good defences. If the petition succeeds, and the Court orders the erring spouse to return, his or her *non-compliance* with the order *will not lead to enforcement* by arrest or otherwise; but it will (so to speak) fix upon him or her responsibility for the separation, and *establish* his or her status as the deserting party (see above). And *non-compliance* with a restitution decree is in itself *a ground* for the other party to petition for a decree of *judicial separation* (see below).

(d) **Judicial Separation.**—A petition for this form of relief may be presented by either spouse on the ground last mentioned in the foregoing paragraph, or on any of the grounds for which a divorce petition (see above) might have been presented. The *effect of the decree* (as in the case of a separation order made by a Magistrates' Court) is that the Petitioner is *no longer bound to cohabit* with the Respondent, and cannot therefore be regarded as a deserting party (The *legal bond* of marriage *remains in force*, the procedure is therefore often employed by a spouse who does not desire divorce, perhaps for reasons of conscience, perhaps merely so as not to allow the other party freedom to marry somebody else.) It is, however, open to a Petitioner, who has obtained a decree of judicial separation, to petition for divorce, on the same facts, at a later date—*provided that three years have elapsed* since the date of the marriage (see D27 (1))

Bars to Relief.—(1) *Absolute Bars*.—It is, by statute, the duty of the Court to investigate, so far as it reasonably can, the facts alleged in any petition for divorce or judicial separation, and to inquire whether there has been any *connivance* or *condonation* on the part of the Petitioner, and whether any *collusion* exists between the parties *The Court must dismiss* the petition, and *refuse a decree, even in an undefended suit, unless* it is satisfied: (*a*) that the *Petitioner has proved his or her case*; (*b*) that the Petitioner has not been *accessory to or connived at* the adultery (if any) of the other party; (*c*) that the Petitioner has not *condoned* the adultery (if any) or the cruelty (if any) of the other party; (*d*) that the petition is not presented or prosecuted *in collusion* with the other party

(a) *The Petitioner must prove the case*—that is to say, satisfy the Court that there are *proper grounds* for a decree *according to law*; there is no such thing, in suits for divorce and judicial separation, as judgment by consent, by admission, or in default of defence (as is possible, for example, in actions for breach of contract (D11) and tort (D12)). *In matrimonial suits* the *State*, and not merely the parties themselves, must see that the provisions of the law are *strictly observed*.

(b) *There must be no connivance*—that is to say, the Petitioner must not have intended *to promote or encourage or provide opportunity for* the commencement or the continuance of the Respondent's adultery Merely *keeping watch upon a suspected spouse*, for the purpose of obtaining evidence, is not necessarily connivance; there must be active *encouragement or acquiescence*—wilfully "shutting one's eyes" to what is going on or likely to take place.

(c) *There must be no condonation* of adultery or cruelty—that is to say, *forgiveness* of all such acts as are known to, or suspected by, the injured spouse, and the restoration of normal marital relations with the offending spouse. ("Forgiveness" means forgiveness *on condition* that there shall be *no further matrimonial offence*.) Condonation may be by words or conduct. The Petitioner *cannot obtain a decree* on the ground of any offence or offences which he or she has *condoned*, except in case of *revival*.

Revival—If, subsequent to the condonation, the offending spouse again commits some matrimonial offence or offences, the former offence or offences are *revived*—*i.e.*, the effect of the forgiveness and restoration (see above) is cancelled, and

the former offence or offences will again afford a ground for divorce or judicial separation. It does not matter whether or not the new offence is of the same nature as the old; condoned adultery will be revived by new acts of cruelty or desertion, condoned cruelty will be revived by a new act of adultery, and so forth.

(d) *There must be no collusion*—that is to say, *no agreement* or *bargain* between the parties (whether for financial consideration or otherwise) that the Petitioner will commence or conduct a suit for divorce or judicial separation, or that the Respondent will not defend such a suit. There is, for example, *collusion* if one party *requests or suggests* that the other *should commit adultery* in order to provide evidence for a divorce, and the other party *accedes* to the request or suggestion. But it is not necessarily collusion for the Petitioner, knowing that *adultery has already been committed*, to ask the other party *for details or for evidence* on which the Petitioner can act. The Court regards financial arrangements between the parties with suspicion, if they are entered into *before the suit is commenced*, and it will carefully investigate such arrangements to satisfy itself that they are not collusive (*e g* , for the purpose of inducing the Petitioner to start proceedings) But once the petition has been filed, there is no objection to discussion between the parties, or their advisers, of necessary financial arrangements as to alimony or maintenance (see D30 (1)) or the disposal of the matrimonial home

(2) *Discretionary Bars*—Apart from connivance, condonation, and collusion, any of which (as we have seen) is an *absolute bar* to the granting of a decree, the *Court has a discretion either to refuse or to grant* a decree of divorce or judicial separation, according to circumstances, if it finds that the *Petitioner* has himself (or herself): (*i*) been *guilty of adultery* during the marriage, (*ii*) *shown unreasonable delay* in presenting or prosecuting the petition, or (*iii*) been guilty of cruelty, or desertion without reasonable cause, *before* the Respondent's acts of adultery or cruelty on which the petition is based. The Court has a similar *discretion*, where the ground for the petition is *adultery, desertion*, or *unsoundness of mind*, either to refuse or to grant a decree to a *Petitioner* who has (*iv*) been guilty of such *wilful neglect or misconduct* as has conduced to (*i e* , helped to bring about) the Respondent's adultery, desertion, or unsoundness of mind.

In a case where each party is asking for a divorce against the other, each admitting his (and her) own misconduct and asking the Court to exercise its discretion in his (and her) favour, the *Court may exercise its discretion in favour of both* and dissolve the marriage

In case (*i*) above, where the *Petitioner* has himself (or herself) been *guilty of adultery*, it is the Petitioner's duty to lodge in the Divorce Registry a *discretion statement*—*i e* , a written statement in a sealed envelope (to be opened only by the Judge at the hearing) admitting the facts and explaining the circumstances of his (or her) adultery The *petition* in such a case must *contain a clause praying the Court* " to exercise its discretion in the Petitioner's favour " (*No details* of the Petitioner's adultery appear *in the petition* itself, thus preventing the Respondent from obtaining evidence of that adultery for use as a weapon against the Petitioner, unless and until such evidence is given in open Court)

Decree Nisi and Decree Absolute.—When the case comes on for trial the Judge will hear the *evidence of the Petitioner* and his or her witnesses, *and legal argument* on his or her behalf; *if the case is defended* by the Respondent spouse, or by the Co-respondent (*i.e.*, any *man* accused, in the petition, of adultery with a Respondent *wife*), or by any *woman named* in the petition as having committed adultery with a Respondent *husband*, the Judge will hear their evidence and legal argument on their behalf. The Judge, if not satisfied on points (*a*), (*b*), (*c*), and (*d*) (D28–9) in a case of divorce or judicial separation, must *dismiss the petition*, in which event the married status of the parties will remain unchanged. If the Judge *is* satisfied on the points mentioned he will, in a suit for *judicial separation*, pronounce a *final decree*, in a *suit for restitution of conjugal rights* he will *order* the deserting spouse to *return to cohabitation* (the effect of the decree and the order is described above, D28 (1)).

In a suit for *nullity* or *divorce*, the Judge will pronounce a decree *nisi*—*i e.*, an order that the marriage is to be *annulled* or *dissolved* unless (*nisi*), before that event takes place, *some cause* is shown to the Court *why final annulment or dissolution ought not to be permitted*. Intervention for this purpose may be made by an official known as the *Queen's Proctor*, or by any member of the public Such interventions after decree *nisi* are rare, but may be made on the ground, for example, that there was a collusive arrangement (para. (*d*) above) between the parties, or some other material fact, which was concealed from the Court at the hearing

If such intervention succeeds, the decree *nisi* will be *rescinded* (*i e* , cancelled) and the parties will retain their former status If there is *no such intervention*, or if such intervention is *dismissed*, then the marriage will be *finally annulled or dissolved* on application (on a special form), at the Divorce Registry concerned (not in open court), by or on behalf of the *Petitioner*, not earlier than *three months* after the decree *nisi* (unless the Court fixes a shorter time by special order). If the Petitioner does not make such an application, then the Respondent may do so after the lapse of a *further three months* (*i e* , six months after the date of the decree *nisi*), and the Court has power to grant or refuse such application or to deal with the case as it thinks fit.

The decree which *finally annuls or dissolves* the marriage is called a *decree absolute* Unless and until it is granted, the marriage tie still subsists; the decree *nisi* does *not* terminate the status of husband and wife But the *decree absolute* does terminate that status, leaving both parties free to marry again

Incidental Matters

(1) Custody and Maintenance of Children.—Apart from the general power of the Chancery Division, as guardian of equity (D5), *to protect the person and the property of any infant* (D7) (even though there may be no matrimonial proceedings between its parents), and apart from the additional powers of that Division and of Magistrates' Courts, under the Guardianship of Infants Act, 1925, *to appoint a guardian or guardians for any infant*, and to make orders for either parent to have *access* to the infant (*i e.*, to see it periodically) and for the infant's *maintenance*, the Divorce Division itself may make orders for the *custody, maintenance, and education of the children of the marriage* which is the subject of any matrimonial proceedings, and give directions for placing them under the protection of the Court, and for access to them by either or both of the parents. The expression " children of the marriage " includes children lawfully adopted by both husband and wife, children of a bigamous " marriage " which has given rise to nullity proceedings (D25), and also children born before the marriage of their parents and legitimated by that (subsequent) marriage. The Court may make such orders and give such directions at any time after proceedings have been commenced for nullity, divorce, judicial

separation, or restitution of conjugal rights; it may make interim orders, and give interim directions, from time to time *during the proceedings*. It is, however, *unusual* for the Divorce Division to make orders for custody of or access to any child *over the age of sixteen* (since such orders would be difficult to enforce). (See also **D31(1)** for recent changes in the law.)

In all such proceedings, in *whatever court* they may be taken, the *paramount consideration* is the *welfare of the children—not the punishment of the "guilty" parent, nor any privilege* of the father as against the mother, or *vice versa*. (It is, for example, unusual for the Court to deprive the mother of the custody of a very young child, even though she has committed or is living in, adultery —unless, or course, she is neglecting the child or is a "bad mother" in the widest sense.) In some cases, for good reason, both parents may be passed over, and the custody of the child may be given to some third party.

(2) **Financial Provision.**—(a) *Alimony Pending Suit.*—On any petition for nullity, divorce, judicial separation, or restitution of conjugal rights, the Divorce Division may make such *order for payment by the husband to the wife* of *alimony pending suit* (*i e.*, a periodical sum for or towards her support *during the proceedings*) as the Court thinks just. The Court may also *order a wife Petitioner*, in a suit for divorce or judicial separation on the ground of the *husband's insanity*, to pay *alimony pending suit* for or towards the *support of the husband during the proceedings.*

(b) *Permanent Alimony* is the term used for similar payments which the Court may order the husband to make to the wife *after* the pronouncement of a *decree of judicial separation* on any ground, and such an order *in favour of the wife* may be made even where a decree has been pronounced *against her*. An order for *permanent alimony* may also be made *in favour of the husband* in a case where the *wife petitioned* for judicial separation on the ground of *his insanity*. *Permanent alimony* may also be ordered in favour of the wife where an order for *restitution of conjugal rights* has been made in her favour.

(It will be observed that, in all the above cases, the period during which the payment of *alimony* may be ordered is *while the status of marriage remains in being*.)

(c) *Permanent Maintenance* is the provision which the Court may order the husband to make in favour of the wife *after a decree absolute* of *divorce or nullity*—*i e.*, for the period *after the married status has been terminated*. (The Court may, *in exceptional cases*, make an order for *permanent maintenance* in favour of a "guilty" wife) In *one case permanent maintenance* may be ordered *against a wife* and *in favour of a husband*—where the *wife petitioned* for divorce on the ground of *his insanity*. The order may be for payment of a *monthly or weekly sum* during the *joint lives of the parties* (*i e.*, so long as they shall *both* live), or for a capital sum to be invested so as "to secure to the wife such gross or annual sum of money for any term not exceeding her life," as the Court thinks reasonable, in both cases having regard to "*her fortune* (if any), to the *ability of the husband*, and to the *conduct of the parties*." The amount of the order is therefore left to the *discretion of the Court*; and it may be varied by the Court from time to time as the circumstances of the parties change. (The words "conduct of the parties" show that, in fixing the payments, the Court does not necessarily regard the question of "guilt" or "innocence" as clear-cut on the one side or the other; it may take into consideration the *whole history of the marriage*. The Court also takes into account the *property and income* of *both parties*.) (*See also* **D32(1) C**)

(d) *Periodical Payments* may be ordered to be made, *by the husband to the wife*, on or after the making of a *decree for restitution of conjugal rights*, for the joint lives of the parties. The Court may order the husband to "secure" such payments as in the case of permanent maintenance. Where the *husband successfully applied* for the decree, the Court may order the wife, if she is "in receipt of any *profits of trade or earnings*," to pay to the husband, or for the benefit of the children, such part of those profits or earnings as it thinks reasonable.

Where a husband has been guilty of *wilful neglect to provide reasonable maintenance* for his wife or infant children, then, in any case where the wife might have petitioned for judicial separation, the Court may (on the wife's application) order the husband to make to her such *periodical payments* as may be just, and it may order the husband to "secure" such payments (as described above). (Thus, where there has been wilful neglect to maintain, on the part of the husband, the wife may apply for financial relief in the Divorce Division instead of in the Magistrates' Court; there is *no limit* in the Divorce Division to £5 a week, as there is in the Magistrates' Court (D24 (2)). And the wife may make such an application even if she does not wish to petition for a decree of nullity, divorce, judicial separation, or restitution of conjugal rights.)

(e) *Settlements.*—In any case in which the Court pronounces a decree for divorce or judicial separation by reason of the *wife's adultery, cruelty, or desertion*, the Court has power to order the wife's property, or any part of it, to be *settled* (D20) for the benefit of the innocent party, or of the children of the marriage, or both.

The Court also has power, after a decree for nullity or divorce, to vary the terms of any settlement which may have been made on the parties before or after their marriage; the variation may be made to benefit the children, or the parties or either of them, as the Court thinks fit.

(f) *Damages against Co-respondent.*—A husband who is petitioning for a decree of *divorce or judicial separation*, on the ground of his *wife's adultery*, may ask for an award of *damages against the Co-respondent* (*i e*, the man with whom she has committed adultery). Such a claim, which is comparatively rare nowadays, is usually tried before a judge and jury; the damages should be assessed so as to *compensate the husband*, so far as possible, for the loss of his wife where she has been seduced from his side by the adulterer.

(g) *Costs.*—The costs of the proceedings are *always in the discretion of the Court*, each case depending on its own facts. Generally speaking, however, the costs "follow the event"—*i e.*, when a decree or order is made against a husband, he will usually be ordered to pay the costs incurred, costs, however, are rarely awarded against a "guilty" wife, but are not infrequently ordered to be paid by the Co-respondent (if any). An order for costs may be made, but rarely is, against the "woman named" in a petition as having committed adultery with the husband.

Note on Domicil.—It has been explained above (see D7) why the English Court will *not, generally speaking*, grant a *divorce* to a man who is *domiciled abroad*. Since the *domicil of a wife* is the same as *that of her husband* (even if she has not lived with him for many years), the refusal of the English court to accept jurisdiction has caused hardship in many cases To mitigate this hardship the Matrimonial Causes Act, 1950, confers upon the Divorce Division an additional statutory jurisdic-

tion in the following cases, *in favour of a wife*, even if her husband is *not domiciled in England*:

(*a*) In *any* matrimonial proceedings, *other than* for a " decree of presumption of death and dissolution of marriage " (see below), if: (i) the wife has been deserted by her husband, or the husband has been deported from the United Kingdom as an alien; and (ii) immediately *before the desertion or deportation* the husband *was* domiciled in England.

(*b*) In proceedings for *divorce* or *nullity*, if: (i) the wife is *resident* (i.e., actually living for the time being) in England; and (ii) has been *ordinarily resident* there for a period of *three years* immediately preceding the commencement of the proceedings, and (iii) the husband is *not* domiciled *in any other part of the United Kingdom*, or in the Channel Islands or the Isle of Man. (The two last-named territories have their own separate systems of law.)

(*c*) In proceedings for a decree of " presumption of death and dissolution of marriage ": the husband is presumed by law (*for the purpose of ascertaining the wife's domicil*) to have died " immediately after the last occasion when she knew, or had reason to believe him, to be living " (Thus the wife can acquire an English domicil of her own as from that date)

And, under the Matrimonial Causes (War Marriages) Act, 1944:

(*d*) In the special case of *marriages celebrated during the Second World War*, where: (i) the *husband* was, at the time of the marriage, domiciled *outside the United Kingdom*, (ii) the *wife* was, immediately before the marriage, *domiciled in England*, and (iii) the parties *never resided together* in the country which was the husband's domicil at the time of the marriage, the Divorce Division may deal with proceedings for divorce or nullity *as if both parties* were at all material times *domiciled in England*. (This provision was to cover the special cases of soldiers from the Dominions or Colonies, the United States or other foreign countries who, while stationed here during the War, married English girls and had to go back to their own countries, *leaving their wives behind*—in some instances without communicating with them again.)

RECENT CHANGES IN THE LAW

Since the above survey was completed, there have been certain important changes in the law, effected by Acts of Parliament:

A. By the Matrimonial Proceedings (Children) Act, 1958

1. The powers of the Divorce Division to provide for the *custody, maintenance, and education of the children* of the parties (D29 (2)) are enlarged to apply also to *a child of one of the parties* (including an *illegitimate* or *adopted* child) " who has been accepted as one of the family by the other party," as they apply to a child (whether legitimate or illegitimate) of *both parties*. All such children are referred to as " children of the family".

2. Where a husband has been *guilty of wilful neglect to provide reasonable maintenance* for his wife or infant children (D30 (2)), enabling the Divorce Division to order the husband to make *periodical payments* to the wife, the words " infant children " are to include any *illegitimate child* of *both* parties, and the Court may make orders for *custody of and access to* (D29 (2)) any such children. If the Court considers it in the *child's best interests*, it may order the periodical payments for the child's benefit to be made *to the child* itself, or *to some other person* on the child's behalf, instead of to the wife (D30 (2)).

3. The same Act contains further enlightened and much-needed reforms for the *protection of the children* in matrimonial proceedings (whether defended or undefended). The Court, generally speaking, is *not* to pronounce a decree of *judicial separation* (D28 (2)), or make *absolute* any decree for *divorce or nullity* (D29 (2)), unless and until the Court is satisfied *either*—

(*a*) that arrangements have been made for the *care and upbringing* of every such child under 16, and that such arrangements are satisfactory or the best that can be devised in the circumstances, *or*

(*b*) that it is impracticable for the party or parties appearing before the Court to make any such arrangements

But the Court *may* proceed without observing these requirements if (i) there are *special reasons* against delay, and (ii) either or both of the parties have given to the Court a *satisfactory undertaking* to bring the question of such arrangements for the children before the Court within a specified time

4. On any application to the Court for *special leave* to present a divorce petition *within three years from the date of marriage* (D27 (1)), the Judge must consider, not only the *possibility of a reconciliation* between the parties and the *interests of the children of the marriage* (which was his duty under the Act of 1950), but also the interests of any child referred to in para A1, above.

5. Even if proceedings for divorce, nullity, or judicial separation are *dismissed*, the Court may still make provision for the custody, maintenance and education of any child referred to in para. A1 above, and may vary such orders from time to time

6. Finally, the Court is given power, in exceptional circumstances, to commit the care of any such child *either* (i) to a *county council* or *county borough council*, *or* (ii) to an *independent person* under the *supervision* (if the Court think fit) of a *welfare officer* or of a county council or county borough council.

B. By the Divorce (Insanity and Desertion) Act, 1958

1. The words " continuously under care and treatment " (in relation to a spouse of unsound mind) (D27 (1)) are to be interpreted *more liberally and more broadly* (in various ways) then has been the practice of the Court in the past.

2. A person who has *deserted* his or her spouse and is now of *unsound mind* may be regarded (for the purpose of divorce or judicial spearation) as *capable of forming the intention of continuing* the desertion, if the Court takes the view that the " deserting " party would in any event have stayed away (even if no unsoundness of mind had supervened). (*Note.* Hitherto the Petitioner has faced almost insuperable difficulties in such cases, since it is not normally possible to attribute to a

person of unsound mind the capability of forming any "intention" whatsoever (D8 (1)).

3. Where the Petitioner is seeking *divorce* on the ground of the Respondent's *desertion* without cause for at least *three years* preceding the presentation of the petition (D27 (1)), any *agreement for separation* (whether in writing or not), entered into before *1st January 1938*, shall be *disregarded* by the Court if either (*a*) the Respondent *had already deserted* the Petitioner, or (*b*) the Court is satisfied that the *circumstances* in which the agreement was made would have amounted to desertion (*without cause*) by the Respondent but for the Petitioner's apparent consent, in the agreement, to a separation.

(*Note* Desertion did not become a ground for divorce until *1st January 1938* Some deserted spouses may have entered into separation agreements, inadvertently, *before* that date, and this provision is intended to mitigate hardship where there was (at that time) a genuine case of desertion but the case was ruined by the signature of a written agreement to live apart, or by some form of spoken words or conduct, on the part of the deserted party, appearing to signify consent to the separation)

C. By the Maintenance Orders Act, 1958

1. Maintenance Orders *made by the High Court* (or a County Court) may be *registered in a Magistrate's Court*, which is given power to *vary* and to *enforce* such Orders. Maintenance Orders *made by a Magistrates' Court* may be *registered in the High Court*, which is given power to *enforce* such Orders. (The purpose of such registration is to make enforcement more easily effective, in some cases it may be more convenient for the wife to resort to High Court procedure, in others to proceed in the Magistrates' Courts.)

2. If the spouse (usually the husband) liable for payments under a Maintenance Order is a person *in employment*, and if his maintenance payments are at least four weeks *in arrear*, then the Court may make an *Attachment of Earnings Order*. This Order will *authorise and direct his employer to deduct from his earnings* certain sums (which the Court will specify) to be handed over *by the employer* to an official of the Court, who will pass them on to the wife as instalments towards the payment of (*a*) the arrears, and (*b*) the amounts currently falling due under the original Maintenance Order (*Note* Hitherto the Courts have had no power to compel employers to collect such payments out of the defaulting husband's earnings, the wife's only remedy has been to ask for an order committing the defaulting husband to prison—a procedure which gave her *no financial redress* or assistance)

The *Attachment of Earnings Order* will also specify the "protected earnings rate"—*i e.*, the rate below which the Court thinks the defaulting husband's earnings should *not* be reduced by virtue of the authorised deductions (*Note* In other words, the Court will see that the defaulter is left with a reasonable part of his earnings to live on.)

D. By the Matrimonial Causes (Property and Maintenance) Act, 1958

1. **The Court is given power to make an order against the Respondent (D27 (1)) for financial provision (D30 (1)) in favour of the Petitioner (D27 (1))** or the children, *either* at the time of the decree *nisi* (D29 (1)) *or* at any subsequent date; but the Court is not to disregard any delay on the part of the Petitioner in applying for such financial provision.

2. The Court is given power to set aside (*i.e.*, cancel the effect of) any disposition of property by a Respondent husband (or former husband) in favour of some third party if that disposition of property has been made within the past three years (preceding the Petitioner's application for financial provision), and seems to have been made with the intention of defeating or frustrating the Petitioner's application. But no such disposition of property is to be set aside if it was made *for valuable consideration* in favour of a *person who acted in good faith* and without knowing of the Respondent's intention to defeat or frustrate the Petitioner's application. (*Note* This will enable the Court to protect a wife, in certain circumstances, if the Respondent husband (or former husband) has (for example) transferred part of his property to his mistress, with the intention of defeating his wife's claim to maintenance, alimony, *etc* Up to now the Court has had no power to remedy such action by a husband who has made a transfer of the kind *prior to* a Court Order for maintenance, *etc*)

3. The power of the Court to order "reasonable provision for maintenance" out of the estate of a deceased person (D16 (2)), in a case where his will or intestacy does not leave his wife "reasonably" provided for, is now extended to benefit a *former wife* (*i e*, "a woman whose marriage with him was during his lifetime dissolved or annulled.") (*Note.* This definition is not limited to a former wife who was the "innocent" party in divorce proceedings, but the Court has a discretion to make or refuse the order, taking all the circumstances into account) Such an order may be discharged varied, suspended or revised at the suit of various interested parties

4. The Court's powers under paras 2 and 3 (above) are extended to protect (*a*) a *former husband* whose former wife has divorced him, or obtained a judicial separation against him, on the ground of *his insanity* (D27 (1)), or (*b*) where the Court has ordered a settlement of the wife's property, or "periodical payments" out of her income, where there has been a decree for restitution of conjugal rights (D28 (1))

5. The executors or administrators (D18 (2)) of the deceased spouse are not to be liable if, when a claim under para 3 is made, they have already distributed the deceased's estate (provided they waited for 6 month after the Grant of Probate or Letters of Administration (D18 (2)), but the claimant under para 3 can follow the property into the hands of a beneficiary and recover it (if it is still available) by means of an order under para 3 (above).

6. Under the Married Women's Property Act. 1882, the Court was given power to decide in a *summary manner* (*i.e*, by a rapid and simple procedure) disputes between any husband and wife about the *ownership of any property*. That power is now extended to cases where the respondent spouse *has been, but no longer* is, in control of the property, or the *claimant does not know* whether it is still in the respondent's control or not The Court may order the necessary enquiries to be made; in appropriate cases it may also order property in the hands of the respondent, or of a third party, *to be sold*, so that the claimant may have his or her share paid out of the proceeds.

CRIME AND PUNISHMENT IN A CHANGING SOCIETY

It is a melancholy reflection that man is not naturally benevolent or tolerant towards his fellows, that humanitarian conduct is not necessarily associated with a belief in theological dogma, cultural values, or political progress, and is seldom induced by well-intentioned admonition or moral exhortation. For example, we may consider the comparative lack of humanising influence, from ethical Christianity or parliamentary democracy, upon such institutions as religious persecution, witch-hunting, slavery, the ill-treatment of lunatics, judicial torture, and the punishment of criminals. *Tout comprendre c'est tout pardonner.* It is only when the philosopher and the scientist begin to speculate upon, and seek out the sources of, conduct which fills the ignorant with horror and disgust that it becomes possible to persuade the ordinary man that these kinds of conduct are not a perverse form of wickedness, calling for passionate condemnation and savage repression, but symptoms, crying out for investigation, of a deeper disorder which must be scientifically diagnosed, its causes meticulously traced and treated, unemotionally and impersonally, with a view to their mitigation or removal.

The Growth of Research.—Religious persecution and witch-hunting, on the most barbarous scale, survived sixteen centuries of Christianity, their desuetude arose, not from the realisation that they were morally wrong, but from the spirit of scepticism that was abroad early in the eighteenth century—reflected particularly in the *Treatise* of David Hume (1738–40) The revolting treatment of persons of unsound mind continued even longer—throughout most of the polite and sophisticated 1700s, when one of the shows available for the amusement of visitors to London was the antics of the inmates of Bethlehem Hospital, or Bedlam: such scenes were material for *The Rake's Progress* of William Hogarth (himself a social reformer) as late as 1735. It was not until the last ten years of the century, when rationalism flourished, and research was devoted to cerebral anatomy and physiology, that insanity was regarded as a matter rather for compassion and treatment than ridicule and contempt. Slavery owed its abolition as much to intellectuals like Steele, Pope, Thomson, Cowper, Sterne, Johnson, and Adam Smith, as to religious reformers like Wesley, Whitefield, and Granville Sharp, it received its death-blow in England (in the early 1770s) from lawyers like Mansfield and political reformers like Wilberforce (In America slavery was the basis of the country's commercial prosperity, and was abolished by political action only in 1865)

Penal Reform.—Penal reform owed its inception principally to two men—the investigator and research-worker John Howard (the greatest of whose work was done between 1777 and 1781), and the Utilitarian philosopher and writer Jeremy Bentham, whose *Principles of Morals and Legislation* (1789) laid the foundations of our present system It was Bentham who advocated the prevention of crime by the scientific method of seeking out and removing its causes, and the reform of the convicted criminal by means of classification, education, and rehabilitation in the community on his discharge. All this followed logically from the Utilitarian doctrine that conduct is morally "good" only when it promotes the greatest happiness of the greatest number, all punishment, being in itself evil, ought to be admitted only so far as it promises to exclude some greater evil.

The advance of most civilised communities has been marked by an *increase* in the stern repression of crime by deterrence. Until comparatively recent times the only conception of punishment, apart from sporadic experiments by reformers like Pope Clement XI (1700–21), who built a prison for the special treatment of young offenders, was by death or the infliction of physical pain. In France, and neighbouring parts of the Continent, the worst savageries of the criminal law were swept away by the Revolution of 1789; in our country Sir Samuel Romilly could say, as late as 1817, "the laws of England are written in blood" In his day the death penalty was still exacted for thefts of more than forty shillings in value; transportation remained a common form of punishment until 1852, when it was replaced by penal servitude, and executions might still take place in public until the end of the 1860s. Even in our own times there have not been lacking judges who regarded deterrence as the principal function of the criminal law.

Recommendations of 1959 White Paper.—In this century, and particularly the past three decades, the emphasis has gradually changed. The 1959 White Paper (Cmnd 645) presented to Parliament by the Home Office, entitled *Penal Practice in a Changing Society*, is a thoughtful and enlightened contribution to an intractable problem As with the reforms we have noted in other walks of life, humanitarianism is not so much the guiding star of its proposals as the calculated effect of applying the scientific method—study of symptoms, research into causes, diagnosis of the ailment, and selection of remedial treatment. The overall impression it makes on the reader is that of formulating a scientific problem in a scientific way, the fluctuations in anti-social conduct—and the present prevalence of indictable offences involving violence—are regarded as symptoms calling, not for panic legislation, but primarily for investigation leading to diagnosis and, eventually, treatment of causes

Four Aims of Penal Theory.—Of the four principal aims of penal theory none is neglected The document does not forget the need for reasonable deterrence, it keeps a sense of proportion over methods of prevention, it puts forward some revolutionary ideas on the question of retribution, and it devotes much careful thought to the subjects of reform and rehabilitation The Foreword refers to plans for the establishment of an Institute of Criminology and for extensive research which will, it is hoped, provide more knowledge of the problem: that knowledge will assist in a fundamental re-examination of penal philosophy, including a reconsideration of the ancient question (which has been virtually lost sight of in modern times) of compensation for the victims of crime The system of preventive detention for persistent offenders is examined, and proposals are submitted for adjusting the treatment of the young and increasing the scope of after-care for adults, for improving methods of classification and training, and towards the solution of the practical problems of accommodation and staff. The lofty aim, which has been adumbrated by more than one Home Secretary in recent years—to make the punishment fit the criminal rather than the crime—is preserved and extended.

Some Theories Discarded.—It has been necessary, on the information available, to discard some cherished theories of nineteenth-century reform—as, for example, that a reduction in poverty and insecurity necessarily tends to a reduction in crime. In the past twenty years rising standards of material prosperity, education

and social welfare have been accompanied by an *increase* in indictable offences against the person, particularly among the 16 to 21 age-group. The graphs at the end of the White Paper clearly show the disproportionately large fluctuations in the number of young offenders, as compared with the total of all ages. Between 1956 and 1958 the male Borstal population has increased by 57 *per cent.* The weapon of detection has not been permitted to fall into disuse; there has been an increase in numbers and in an improvement in the efficiency of police officers to keep pace with the rise in crime and the greater ingenuity of its perpetrators. At Quarter Sessions, Assizes, and the Central Criminal Court the number of cases tried has doubled between 1938 and 1956. And while the powers of the Courts to inflict severe penalties have suffered little interference (the rarer incidence of the death penalty, and the virtual abolition of corporal punishment, are outstanding exceptions), there has been: (*a*) a great improvement in the procedure for obtaining information about the offender's background, and (*b*) a considerable increase in the variety of methods of punishment available—advantageous equally from the standpoints of prevention and of reform. A Committee has been appointed to review the arrangements under (*a*), and another to make proposals for Criminal Law Revision, "in order that those deserving punishment shall not escape owing to defects in the criminal law."

Research into Causes of Anti-social Conduct.—Research is being extended into the causes of delinquency and into the comparative values of the various forms of treatment. The work is being shared between academic and official agencies in collaboration, and impressive details are given in an Appendix. Efforts will be made to identify the characteristics in individual offenders which may indicate the suitability of certain kinds of treatment, not forgetting the study of the psychological and sociological processes that take place among groups of men brought together under prison conditions. The study of criminology will be pursued on the highest academic level, and it is hoped also to bring students together with those concerned in the administration of justice and the treatment of offenders.

Society's Obligation to the Victim.—The section of the document dealing with the Development of Penal Methods contains one important innovation. This lays down the necessity for a fresh approach to examine not only the mutual relations between the offender and society at large but also the obligations of both to the victim. The concept of personal reparation, added to those of deterrence, reform, and rehabilitation, might well increase the redemptive value of punishment. Criminal law in its earliest form recognised the first of these concepts. In recent years the idea has been revived by the late Elizabeth Fry. The Government has set up a working party to examine the practical side of this proposal, in which the association of selected prisoners with ordinary industry, and contributions from their weekly earnings, will play some part.

Realistic Thinking.—In its attitude to the problem, the White Paper is a worthy successor to the *Principles* of Bentham, and provides a scientific examination of the question on Utilitarian lines. An admirable feature is the avoidance of a dogmatic approach; the concluding section contains the following passage.

> "In dealing with problems arising out of human behaviour we cannot plan with certainty. New knowledge and experience of new methods may lead us to abandon principles which seemed well established, or techniques that have held great promise. We must always be ready to experiment and to adjust our thinking realistically according to the outcome."

Recent Reforms in the Law.—*The Criminal Justice Act*, passed into law in July 1961, puts some of the above recommendations into practice. The basis of the Act is to provide a complete range of effective and appropriate measures of detention and punishment for *young offenders.* There has been a substantial *increase in juvenile delinquency*, not only in Great Britain but also in such prosperous and highly-developed countries as Sweden and the United States. In Britain the rate of crime among boys from 14 to 17 years of age was nearly 50 *per cent.* higher in 1959 than in 1954; while among those between 17 and 21 it had almost doubled.

Nevertheless, the Government is determined, in applying the twin objectives of deterrence and prevention, not to lose sight of the necessity: (*a*) of preventing young people, in trouble for the first time, from contamination by contact with hardened criminals, and (*b*) of reforming those who have but recently engaged in criminal activities. There is no evidence that *corporal punishment* (for the restoration of which there has been much agitation) is a greater deterrent than detention, probation, supervision, or after-care; while its reformative value is nil. Therefore the Government has omitted from the Act any proposal for the reintroduction of corporal punishment, which was abolished in 1948. The powers of the Courts, and the varieties of punishment available, are regarded as adequate.

The *Police Force* is to be brought up to *full strength*, so that the principal deterrent against crime—the likelihood of detection—may be safeguarded. Extensive building plans have been made for more detention centres, borstals, and approved schools. There are also to be more *attendance centres*, which provide a valuable means of checking boys, who have broken their probation but who are not under detention, from drifting into serious delinquency; most of these are for the under 17s, but an experimental attendance centre has been started for youths between 17 and 21.

It is the Government's aim to *abolish imprisonment for young offenders in all but the very gravest of cases. Short sentences* of imprisonment are to be *discontinued* as sufficient detention centres become available. During detention and imprisonment *reformative influences* will be constantly brought to bear, and the principle of *compulsory after-care* is to be extended. The minimum age at which a sentence of *borstal training* may be imposed is to be reduced from 16 to 15. Sentences may range from a minimum of six months to a maximum of two years, but the Court is not to pass such a sentence unless it considers: (*a*) that at least six months' training is necessary, and (*b*) that (where the offender is under 17) no other method of dealing with him is appropriate. In detention centres and remand homes boys between 14 and 17, sentenced by magistrates, will serve a fixed term of three months, for graver offences, dealt with by the higher courts, there will be a minimum of three and a maximum of six months for all offenders under 21.

Higher maximum limits are set to the *fines* that magistrates may impose for offences committed by children and young persons; the obligation on a parent to pay damages or costs awarded against his child is extended to *compensation for the victim* of the offence.

Managers of *approved schools* are permitted (with Home Office consent) to bring any offender, 15 years old or more, before a magistrates' court, which will have power to order his *transfer to borstal*, or to remove him to another approved school, a remand centre, or a remand home for twenty-eight days. The *minimum age* at which a child may be ordered to go to an *attendance centre* is *reduced from* 12 *to* 10.

Under the Children and Young Persons Act, 1963, the *minimum age of criminal responsibility* has been *raised* from 8 to 10.

FREE SPEECH AND PUBLIC ORDER

In the constitution of our parliamentary democracy (see **D5**) certain unwritten rules have been recognised for about three centuries past. These rules, which are not always easy to reconcile, may be summarised as follows

(1) **Free Speech.**—Free and open discussion, *within the law*, ought to be permitted, both in private and in public, of all political, social, moral and religious questions

(2) **Unpopular Opinions.**—Unpopular or minority opinions, *lawfully expressed*, privately or publicly, by act or word, *do not become unlawful* merely because their expression may induce *other people* to commit *unlawful* acts

(3) **Provocation.**—Every man is presumed to *intend* the *natural consequences* of his acts, hence, the use of *threatening, abusive or insulting* language or behaviour, if it is *naturally* provocative of disorder, is *unlawful*

(4) **Public Order.**—The *preservation of public order* is of paramount importance, a magistrate or police officer has a *right and duty* to take *any steps* necessary to *stop a breach of the peace* taking place, or to prevent a breach which he reasonably apprehends.

These rules have been widely discussed during the past year, as a result of the activities of political extremists who make a special feature of propaganda against racial or religious minorities. Some of their meetings and marches have been accompanied by grave public disorder

Until comparatively recent times the whole subject depended upon common law decisions (**D4**), not statute law (**D5**). For example.

Unlawful Assembly is a common law offence, constituted by an assembly of three or more persons, intending either *to commit a crime* by open force, or to carry out any *common purpose, whether lawful or unlawful*, in such manner as to give *firm and courageous persons* in the neighbourhood *reasonable grounds* to apprehend a *breach of the peace* in consequence of the assembly (The words "any *common* purpose, *whether lawful or unlawful*," should be noted.)

Sedition is a common law crime, which includes the doing of *acts* or the speaking of *words* with the *intention* of promoting feelings of *ill-will or hostility* between different classes of the Queen's subjects. If the words or acts (whatever the intention) have a *direct tendency* to cause *unlawful meetings or disturbances*, they are seditious, since "a man is *presumed to intend* the *natural* consequences of his acts" (see (3), above). This does not mean that there must be no full and free discussion, nor that there is any prohibition upon criticism, or even censure, but there must be *no malignity*, nor any imputation of *corrupt or malicious motives*, such as to incite people *to take the law into their own hands* and to provoke them to *tumult and disorder*

With these principles in mind, let us consider some actual cases (decided during the past eighty years) in which these rules have been applied.

Beatty v. Gillbanks (1882) arose from the activities of the newly-founded Salvation Army, which was "an association for carrying out religious exercises among themselves, and for a religious revival among certain classes of the community." Its leaders formed their followers into *processions* which marched through the streets of Weston-super-Mare, with *bands and banners*, collecting people as they marched back to their hall, where *prayer-meetings* were held. They were opposed on several occasions by an organisation calling itself the "Skeleton Army," which objected to these religious exercises. In consequence, disorders frequently arose, and the Salvation Army leaders were charged with "unlawfully and tumultuously assembling to the disturbance of the peace." The Magistrates bound them over to be of good behaviour; the Salvation Army appealed to the High Court.

The Judges decided that *the Magistrates were wrong*. "Everyone must be taken to intend the *natural* consequences of his acts" ((3), above) "and *if* this disturbance of the peace was the *natural consequence* of the Salvation Army's activities, they would have been liable, and the Magistrates would have been right to bind them over. But the evidence does not support this contention. There was nothing in their conduct which was either tumultuous or against the peace, on the contrary, the evidence shows the disturbances were caused by other people, antagonistic to them. What has happened here is that an *unlawful organisation* has assumed to itself the right *to prevent* the Salvation Army from *lawfully assembling*, and the *decision of the Magistrates* amounts to this—that a man may be *convicted for doing a lawful act if he knows that his doing it may cause another to do an unlawful act.* There is *no authority* for such a proposition."

Wise v. Dunning (1902) is a contrasting case. A fanatical *Protestant clergyman* had, on several occasions, held meetings in parts of Liverpool containing a *strong Roman Catholic population.* At these meetings he had used *offensive, violent, and provocative language*, attacking the Pope and the Roman Catholic Church. In consequence, breaches of the peace had occurred, and the Liverpool Magistrate had bound him over to be of good behaviour. The Protestant clergyman appealed to the High Court, protesting that there was no evidence that he had committed or intended to commit a breach of the peace, and that the Magistrate's decision (as in the earlier case) was wrong. But the Judges *upheld the Magistrate's decision and dismissed the appeal.* The Lord Chief Justice said "there was abundant evidence that, in the public streets, he had used *language which was abusive*, which had *caused an obstruction*, and that he intended to do *similar acts* in another place." The two other Judges said that every case depends upon its own *facts* and *evidence:*

> "The law does not as a rule regard an illegal act as being the natural consequence of a temptation held out to commit it, but . the cases show that *the law regards the infirmity of human temper* to the extent of considering that a breach of the peace, although an illegal act, may be the *natural consequence* of *insulting or abusive* language or conduct."

The clergyman's behaviour (unlike that of the Salavation Army leaders in the earlier case) was *in itself violently provocative*, therefore the Magistrate was justified in binding him over, "under preventive power" to stop breaches of the peace, which were the "natural result" of his behaviour.

Both the above cases, as it happened, dealt with religious controversies. But the same rules apply in controversies of other kinds.

Duncan v. Jones (1936) was concerned with provocation on a *political and social* question. There was grave unemployment at the time, and feelings between the unemployed, and their supporters, against the Government, and its policies, ran high. Mrs Jones had held a *meeting of unemployed* men right *opposite an unemployed training-centre*, she had made a speech strongly attacking the Government's policy, and a *disturbance had followed*. Fourteen months later, when she appeared at the *same place* for the *same purpose*, the Police Superintendent forbade her to hold the meeting there. She insisted on doing so, stepped on her box, and began to address the bystanders. It was not, at that stage, suggested that she was obstructing the highway, or inciting anybody to commit a breach of the peace. Nevertheless she was *convicted of obstructing* the Superintendent *in the execution of his duty*, and her conviction was upheld by the High Court. "She must have known (from earlier experience) the *natural consequence* of holding such a meeting at that place, the Superintendent *reasonably apprehended a*

breach of the peace; it therefore became *his duty to prevent it,* and she was guilty of *obstructing him in carrying out that duty.*"

The Public Order Act, 1936.—In the period preceding the Second World War, extremist political organisations held meetings at which they wore political uniforms and used "strong-arm" tactics similar to those in vogue among the Italian Fascists and German Nazis They also indulged, like the Nazis, in virulent propaganda calculated to stir up racial hatred As a result of the exasperation of public feelings, in the existing state of international tension, grave disorders took place in London and other cities. The situation was discussed in both Houses of Parliament and it was generally agreed that the law required to be *clarified and strengthened* On December 18, 1936, the *Public Order Act* received the Royal Assent, and came into force on January 1, 1937.

Prohibition of Political Uniforms.—Section 1 of the Act (subject to certain exceptions) *forbids the wearing,* in a *public place* or at a *public meeting,* of *uniform* signifying the wearer's association with a *political organisation,* or with the promotion of a *political object.* (The exceptions are "ceremonial, anniversary or other special occasions" on which the Chief Officer of Police may permit a relaxation of the prohibition (with the Home Secretary's consent) only if he is satisfied that no risk of public disorder is likely to be involved)

Prohibition of Quasi-Military Organisations.—Section 2 makes it an *offence* to participate in the *control or management* of an *association* whose members are (*a*) *organised* or *trained* or *equipped* to enable them to be employed "in usurping the functions of the police or of the armed forces of the Crown," or (*b*) *organised and trained,* or *organised and equipped* as follows either (i) for the purpose of the use or display of *physical force* in promoting a *political object,* or (ii) in such manner as to arouse *reasonable apprehension* that they are *organised,* and either *trained or equipped,* for the purpose described in (i) (It was under (*b*) (ii) that two of the leaders of a present-day extremist political organisation were convicted and sentenced to imprisonment in October, 1962, at the Central Criminal Court, their appeals, in November, were dismissed) The consent of the Attorney-General (the Senior Law Officer of the Crown) is required before a prosecution under Section 2 can be instituted In certain circumstances a High Court Order may be made to search the premises of the organisation and to impound its property

Preservation of Public Order on the Occasion of Processions.—Section 3 confers powers for this purpose, as follows·

(1) On a *Chief Officer of Police,* if he has *reasonable grounds* for *apprehending* that a *procession* may occasion *serious public disorder* (having regard to time, place and circumstances), power *to impose* on the organisers or participants in the procession such *conditions* as appear *necessary for preserving public order* (including the route of the procession and power to prohibit it from entering any "public place"), but no conditions restricting the display of *flags, banners or emblems* are to be imposed unless they are *reasonably necessary to prevent risk of a breach of the peace.*

(2) On a *Borough or Urban District Council* (if the Chief Officer of Police believes that his powers under (1) (above) will not suffice to prevent serious public disorder, and on application by him) power to *make an Order* (with the consent of the Home Secretary) *prohibiting* all *public processions,* or certain classes of public processions in the area for a period *not exceeding three months* (This power does not apply within the City of London or the Metropolitan Police Area, as to which see (3) (below).)

(3) On the *Commissioner of the City of London Police,* and the *Commissioner of Metropolitan Police,* a power similar to that described in (2) (above), and on similar conditions Thus, within the *London Area* the *Police Authorities,* and in *urban areas outside London* the *Local Authorities,* are given *power to prohibit processions* (or "marches") on the conditions described in (2) above

It is an *offence* for anybody *knowingly to fail to comply* with any *Order* or *condition* imposed, *or to organise* or *assist in organising* a public procession *in contravention* of the Section.

It should be noted that *this Section* deals with *processions* (or "marches")—*not meetings* *Meetings* continue to be *governed by the common law* principles laid down in *Beatty v. Gillbanks, Wise v. Dunning,* etc (as extended by Sections 4 and 5 of the Act).

Prohibition of Offensive Weapons.—By Section 4, anybody is guilty of an *offence* if he has with him any *offensive weapon* at a *public meeting* or *on the occasion of* a *public procession,* without lawful authority (Note the words "*on the occasion of* a public procession", it is *not only those taking part* in the procession, *but also bystanders,* who may commit this offence) "Lawful authority" extends to servants of the Crown, Members of Parliament or of a Local Authority (acting as such), police officers, members of Fire Brigades or Cadet Corps, and so forth

Prohibition of Offensive Conduct Conducive to Breaches of the Peace.—Section 5 reads—"Any person who in any *public place or* at any *public meeting* uses *threatening, abusive* or *insulting* words or behaviour with *intent to provoke* a *breach of the peace, or* whereby a *breach of the peace is likely to be occasioned,* shall be guilty of an offence." (This *declares and clarifies* the *common law* principles laid down in *Wise v Dunning* and *Duncan v Jones* (above))

Disorderly Conduct at a Public Meeting.—Section 6 refers to the **Public Meeting Act, 1908.** Section 1 of the 1908 Act makes it an offence for a person to *act in a disorderly manner* at a *lawful* public meeting for the purpose of *preventing the transaction of the meeting's business* Section 6 of the 1936 Act gives power to a constable, if he *reasonably suspects* an offence under the 1908 Act, *to demand* of the suspected offender his *name and address* (provided that the chairman of the meeting requests him to do so) If the suspected offender *refuses* or fails to give his name and address, or gives a *false name and address,* he *commits an offence,* and the constable may arrest him without warrant (Note that, to qualify for protection, the public meeting must, in the first place, be *lawful*)

Probable Changes in the Law.—The above is a summary (at the time of writing) of the *common law and statutory rules* on this important subject In the House of Commons, on November 9, 1962, the *Home Secretary* said

1 The *penalties* under the Public Order Act are *inadequate* and will be increased as soon as opportunity occurs

2. The preservation of *public order does not depend only on the Act* or on statute law generally

3 The *common law offence of sedition* is committed by a person who speaks or publishes *words calculated to provoke a breach of the peace,* this *includes* the intention of stirring up *hatred or hostility* (whether *on racial or other grounds*) between different classes of the Queen's subjects The *punishment*—fine or imprisonment—is *within the Court's discretion.*

4 The whole *House abhors racial hatred,* and *if* current cases show that the law needs further strengthening, it will be *effectively reformed* to check the evil.

Law reform in England has usually come about as the *result of experience,* and we may expect two main reforms:

(*a*) To make it an *offence violently to provoke, threaten or abuse* racial or religious *minorities,* or to *incite* people *to racial or religious hatred;*

(*b*) *To extend Section 3* of the Public Order Act (power to control or prohibit *processions*) *to public meetings* whenever necessary for the preservation of public order.

Education and Careers

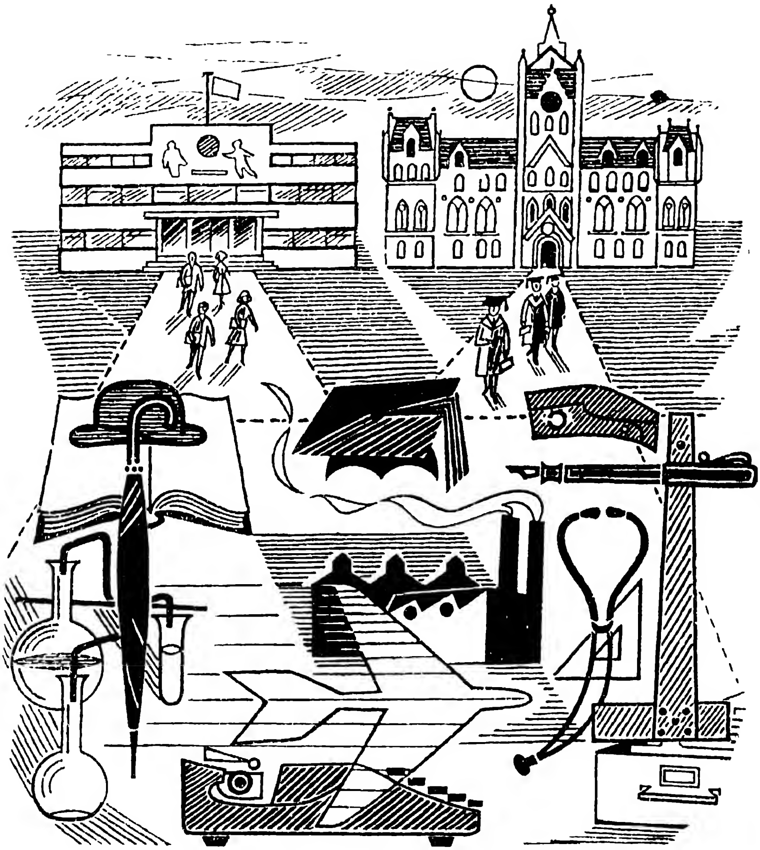

TABLE OF CONTENTS

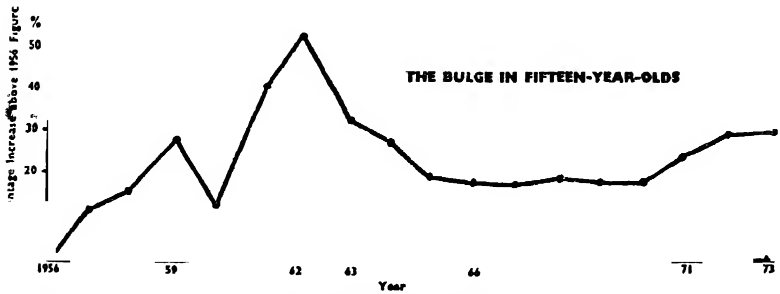
Education and Careers

INTRODUCTION.

AUNTS and uncles can be infuriating when they insist on asking what their nephews and nieces intend being when they grow up The fact is that very few boys and girls do know, while they are still at school, what they want to be when they leave.

The following pages are written in an attempt to be helpful to nieces and nephews and to their parents, whether or not the great decision has yet been made. For those still undecided there are some hints about coming to a decision, and for those who are already inclining towards some job or career, there is practical advice not only about how to prepare for entry, what sort of examinations have to be passed but also what sort of studying may be required even after starting on the job.

The need to take great pains about selecting a job for boys and girls leaving schools in the 1960s is underlined by the lesson to be learned from the chart printed below.



NOTE ON GRAPH.—Taking 1956 as the base level, this graph shows the percentage increase in the numbers reaching the age of 15 in each year, up to 1973 in Great Britain
The actual number for the year 1956 was 613,000; for 1962 (the top of the bulge) 929,000 is estimated, and for 1973, the figure is 805,000.

The lesson, of course, is that there may be too many children chasing too few training posts during the coming years, and each of those children would do well to realise that the ones with the higher qualifications, the ones who are better schooled or better trained for making themselves useful in a job, will be those to be selected for the job of their choice.

Once upon a time the only jobs for which the candidates needed training and testing by written examination were the Church, the Law, Medicine, and Teaching, and for all these the candidates had to go to University. Today there is hardly a trade and there is no profession which does not demand, not only a form of training, but a training which has to be tested by written examinations These examinations may be taken while at school, but also they are often taken after leaving school, the candidate working either full-time, at a University or a Technical College, or part-time, while earning. It is particularly with this sort of job that this section will deal.

CHOOSING A CAREER

Some Personal Advice.—Before starting to deal with the groups of possible jobs, it would perhaps be helpful to say a word about how to decide what sort of work to go for. An old trick is to think of the answer to this kind of question:—

Likes

E.g., "Do I like working with people?"
"Do I like working for people?"
"Do I like working with animals or plants?"
"Do I like working with things?"
"Do I like 'Paper Work'?"

Attainments

E.g., "What standard shall I reach at School?":—
Local Leaving Certificate.
U.E.I. or R S A. Examinations.
G.C.E. Ordinary levels in the subjects usually regarded as less difficult, *e g.*, Geography, Art, Woodwork, English, General Science, Elementary Mathematics.
G.C.E. Ordinary levels in the more difficult subjects, *e.g.*, Additional Mathematics, French, Latin, German, Physics, Chemistry.
G.C.E. Advanced levels.
G.C.E. Scholarship levels.

Talents

E g., "Have I any special talents for figures, for writing good English, for languages, for science, for drawing, for mending things, for making things with my hands?"

Disposition

E.g., "Would I be prepared to give up some of my leisure time to working for examinations?"

Some Suggestions.

Having thought about the answers to these questions, it is now time to make a rough survey of the jobs which exist today. These are given below under three main headings, and examples are given of jobs, each of which will probably require time to be spent, after leaving school, on working for exams.

Group One. Office Work.

Largely concerned with problems expressed in words or in figures.

Examples:

Accountancy.
Banks and Insurance Offices.
Solicitors' Offices.
Civil Service and Local Government Service.
Building Societies.
Librarianship.

Group Two. Practical Work.

Largely concerned with studying, designing, making, and repairing things.

Examples.

- Mechanical, Electrical, Civil Engineering.
- Surveying and Architecture.
- Draughtsmanship.
- Agriculture and Forestry and Horticulture.
- Dentistry or Surgery or Medical Services, *e.g.*, Physiotherapy.
- Laboratory Work.

Group Three. Social Work.

Largely concerned with contacts with other people, teaching them, advising them, observing them, persuading them.

Examples:

- Salesmanship and Purchasing.
- Teaching.
- The Church.
- General Medical Practice, *i.e.*, ordinary doctor.
- Journalism.
- The Armed Services.
- The Police.
- Hotel Management.
- Nursing and Welfare Work, *e.g.*, Almoner or Probation Service.

The list of examples could, of course, quite easily be multiplied by ten, but those given are enough for the moment. Here is some advice to a boy or girl as to how to use them:

You will find other suggestions in the list of booklets on E34. No 1 in the series "Choosing Your Career" sets out the basic questions which have to be answered when deciding upon a career The *Careers Guide* published by H.M S O. (7*s* 6*d*) is very useful on opportunities in the Professions, Industry and Commerce.

Having answered the questions and studied the lists, make a list of your own, of all the occupations which you think might attract you, and then read the passage about them later in this section.

Having done this, and having read some of the recommended books or pamphlets on them, then you *must* go and get some advice. This is most important: you really cannot afford to rely merely on written advice for something so important as your future. You ought to be able to get advice from your school—from the Head, or from your House Master or House Mistress, or from the member of staff in charge of Careers—but it has to be admitted that not all schools are very up to date about these things, and not all children feel the confidence they ought to feel about the advice given them by teachers; if this is so, there is always the expert available for every young person in Great Britain, and that is the *Youth Employment Officer* whose address will be in the Post Office. Of course, you can often contact the Y E.O. through your school, and this is preferable, but not absolutely necessary. The great thing is to get his or her advice; it won't cost you anything, and it won't be biased, and you can be sure that he will do all he can, after a good long interview, to put you on the right track to your future. Of course you may feel, and some parents may feel, that this is not enough, if so, one of the following will help you They will give you a lengthy consultation with tests of various kinds and will charge a fee:—The National Institute of Industrial Psychology, 14 Welbeck Street, W 1, The Vocational Guidance Association, 37a Devonshire Street, W.1.

EXAMINATIONS AND COURSES.

Examinations.—Before starting on any of the detailed requirements for those who are hoping for particular jobs, a general picture of the Examination Field may be helpful. The first important point to make clear is that a boy or girl does not have to have been at a Grammar School or at an Independent School in order to enter the Examination Field. A growing number of other schools are offering examination courses which will be useful for those who want qualifications before leaving school, but even those who are not able to benefit by these while still at school, who may be in a Secondary Modern School where no external examinations are taken, or who may not be regarded by the school authorities as "up to taking" an examination, need not feel cut off from their opportunities. There is often the chance of continuing full-time education at a College of Further Education. If it is important to earn some money, there are plenty of jobs waiting for those who are prepared to work, perhaps in the evenings, perhaps on the one day per week they are released by their employers (this system is known as the day-release scheme). By this means there are valuable qualifications that can be acquired in competition with those who have been to schools where examinations are the normal end to a school career.

It is important, too, not to be discouraged by an unsuccessful career at school; often boys or girls who have been hopeless in class will suddenly, after leaving school, begin to do work, perhaps in mathematics, which was quite beyond them at school, because they suddenly see the sense in learning the subject which only then they realise is connected with the work they want to do.

Some examinations are normally taken while at school, others, normally only after leaving. The commonest In-school examination is of course the *General Certificate of Education*, though it can also be taken by those who have left school, particularly in Technical or Further Education Colleges, but also through Correspondence Colleges (*see* below).

Apart from the G.C.E. there are certain other examinations and certificates; among these there are:—

Certificates of the City and Guilds Institute. The courses available through the Institute can be taken at Technical Colleges and are sometimes begun at school More than three hundred subjects, mainly technical subjects, are available. The corresponding body (mainly for non-technical subjects) is the *Royal Society of Arts*.

It will be noticed that many correspondence colleges prepare students to take examinations of various Professional Institutions, these examinations vary with each profession, and almost all of them have separate stages. Often it will be found that if a candidate has passed the G C.E. at Ordinary level in certain subjects he can start the professional course farther on, that is to say he is "exempted" from one of the early stages of the course With Advanced level still further "exemption" is often allowed.

University Degree.

The General Certificate of Education is essential for anyone wishing to take a degree at a British University, and the details for qualifying for University entry are uniform, except that Oxford and Cambridge are a law unto themselves, and every Faculty of each University has its own special requirements concerning particular subjects passed at Advanced and Ordinary level, which is only to be expected. The minimum entrance qualifications are given below, but it is important to check with the Registrar of the University whether there are any special requirements You need no "Street Address" for a University, simply write to the Registrar, The University, and then the name of the town or city.

SOME CORRESPONDENCE COLLEGES

The Bennett College Ltd., Sheffield.

British College of Accountancy, 20 Milton Road, Harpenden, Herts.

British Institute of Engineering Technology, College House, 29 Wrights Lane, W.8.

Civil Service Correspondence School, 10 Station Parade, High Street, S.W.12.

Minimum Entrance Requirements for University and for Colleges of Advanced Technology:—

Anyone needing help in entering a University should read *University and College Entrance, the basic facts*, published by the National Union of Teachers (4s)

Degree.

1 The candidate usually should have passed in English Language and in either four, or five other subjects.

2. The subjects usually should include —

(a) a language other than English.

(b) either mathematics or an approved science (ask the Registrar about this if in doubt)

3 At least two of the subjects must be passed at Advanced level

4 In view of the increasing difficulty in obtaining a place at a University, candidates should offer more than the minimum number of passes stated above and the marks obtained should be well above the pass level

5. It is usually more difficult to obtain a place at a University to read for a degree in pure science than it is for a degree in one of the technologies, e g , food, glass, textile, or timber technology

6 A University degree is, of course, essential for doctors, dentists, surgeons, for almost all teachers of Grammar School standard, and in nearly all cases for those who hope to go into the Church of England. In nearly all other professions a degree is an advantage, and this is so even in the technical world

Diploma in Technology. However, for those who are technically minded, and who are not attracted by study which has not much connection with the practical applications of their chosen field, there has recently been instituted a special *Diploma in Technology*, which has equivalent status to a degree. This entails four or five years' full-time study sandwiched in between long periods of working in the related industry The "Dip Tech" can be taken at Colleges of Advanced Technology known familiarly as CATS and at *some* other Colleges of Technology and Technical Colleges

In order to qualify for acceptance on a Dip Tech course, it is necessary to have similar qualifications as for minimum University entrance Advanced levels in mathematics and physics, and/or chemistry will probably be essential, though there will not be so much rigidity about the Ordinary levels. A *good* Ordinary National Certificate or Ordinary National Diploma also qualifies

National Certificate and National Diploma. There is also a means of entrance through the *National Certificate* and *National Diploma*, but it is safest to make enquiries concerning this mode of entry

The National Diploma is awarded at the Ordinary level to students who have successfully completed full-time courses for two years from age 16, the *Higher National Diploma* is awarded after a three-year full-time course These diplomas are usually worked for at Colleges of Technology, and are related to some technical career. The same is true of the *Higher and Ordinary National Certificates*. The O N.C. is awarded to students who successfully complete two years' part-time study The entry to these courses is four G C E O level passes (mathematics, physics, English language or technical drawing and one other) or by the completion of a general course at a College

The Higher National Diploma and Higher National Certificate can normally be taken at a *Regional College of Technology* or at a CAT; the Ordinary National Certificates and Diplomas, City and Guilds Examinations, and the courses run by various professional bodies are usually provided for in *Area Colleges* In some places *Colleges of Further Education* provide courses which lead on to those taken in the *Area* or even the *Regional College* See Chart (E5)

SCHOOL SUBJECTS AND CHOICE OF CAREER.

The courses available at various schools tend to become narrower after the pupil has reached the early teens, and narrower still after O level has been taken There are some careers for which it is important to begin and to keep on with certain subjects at this stage This does not mean that all other subjects should be dropped (on the contrary), nor does it mean that there are not a very large number of careers for which no particular specialisation is necessary, but it may be helpful to indicate the careers which are listed in this section, for which certain subjects ought to be studied seriously while at school

For all scientific and technical careers, mathematics is important, and a fairly wide range of sciences useful For engineering (including draughtsmanship), mathematics should be linked with physics For the medical careers (doctor, dentist, medical auxiliary, pharmacist), chemistry, backed up by physics and perhaps by biology, is important (for optics, physics and biology are the valuable subjects) For agriculture and forestry, chemistry and biology are useful For photography, physics or chemistry is important

For an actuary, mathematics to a high level is essential, for an air hostess, fluency in a foreign language

For a number of professions (e g , accountancy, surveying, chiropody, insurance), a range of four, five, or six subjects to O level is the necessary minimum and usually include English, sometimes mathematics, sometimes a foreign language But it must be borne in mind that these are *minimum* requirements only and that study beyond O level (in any subjects) makes successful passing of the professional examinations more likely

Although O level mathematics is usually required for banking, accountancy, insurance, these must not be looked on as "mathematical" careers

There is so much emphasis on technical matters in the Forces nowadays that mathematics and physics are extremely useful here.

It will be noticed that there is a large number of careers which are described later in this section which do not figure in the above list. For most of them, a good range of subjects is important rather than one or two special ones. It is often frustrating and sometimes dangerous to assume that particular school subjects link inevitably with particular careers For instance, English is by no means the only important subject for journalism, but ease of expression in spoken and written English is of immense value in all sorts of careers, from engineering to accountancy. Geography, history, English literature, modern and classical languages, art, music, scripture, and other similar subjects should not normally be linked to careers unless one or other of them is to be specialised in to, say, degree or other high level

But employers appreciate the fact that they have been studied, and are often attracted by the applicant who has gone on with study in a range of them.

APPRENTICESHIPS

An apprentice learns his trade while working at it; after a set period of years the apprentice becomes a skilled or a qualified person. Engineering is today the career where there are more apprenticeships than in any other trade, so the examples given below are taken mainly from engineering, but it should be remembered that many other trades now run apprenticeship schemes, but they are based on a similar system to that described here. *See* Chart (E5).

First comes the *Craft Apprenticeship*, taken up by a boy who has done well at a Secondary Modern or perhaps less well at a Technical School, and apprenticeship usually begins between the ages of 15 and 16, after a probationary period an apprentice is set to a particular trade, such as glass-blowing, fitting and turning, printing, or plumbing, and he is expected to study the theoretical background to his craft at the Technical College, working in most cases towards a City and Guilds Certificate

Next comes the *Technical or Technician Apprenticeship*, started at 16–17, sometimes known as Student Apprenticeship The standard of entry for this would be either the G C E O level in four subjects including mathematics, physics and English language or the successful completion of a general course at a Technical College The Technician Apprentice will usually study one day a week at a Technical College, either on a National Certificate course or a Technician's course These apprenticeships can lead to such jobs as draughtsman, inspector, tester, laboratory assistant

Next comes the proper *Student Apprenticeship* for which either G C E. A level including mathematics and physics or a *good* ordinary National Certificate is essential The course will lead to a Higher National Certificate, a Higher National Diploma or a Diploma in Technology, on a day release basis or for the Diploma on a sandwich course. In the sandwich course the student spends up to six months in each year full-time at a College with a corresponding time (full-time) at work Alternatively, after a year in industry, the student apprentice may be sent to University for a full-time degree course, occasionally at his employer's expense

Ultimately the aim of the student will be to qualify for membership of a professional Engineering Institution and further work and practical experience will be necessary before he becomes eligible for membership

Finally, there is the *Graduate Apprenticeship*, which is entered after the University and which serves as an introduction for the graduate to the practical side of industry, sometimes this type of apprenticeship is arranged in the form of a sandwich course, the practical training preceding as well as following the University course

FINANCIAL AID TO STUDENTS.

Nowadays no one who is able to continue studying either at school or after leaving school should be put off by fear of financial difficulties It may, of course, be frustrating for the fifteen-year-olds, or for the Sixth Formers, to see their contemporaries earning good money or having a good time while they are studying, but frustration turns to jubilation when the last exams are finished with, and when the much-desired and valued qualifications are leading the former victims not only to better paid but to more interesting work

School Maintenance Grants —It may be a question of staying on at school to take Ordinary or Advanced level examinations, students are not yet paid for this, but in some cases parents are, widows and those whose income is equally low are often eligible for maintenance grants (to maintain a child at school), which for a sixteen-year-old may be as much as £80 per annum Application for such grants should be made to the local Education Officer It should not be forgotten either that an income-tax allowance of £150 is granted for each child over 16 who is in full-time education

University Grants —After school, university grants are available from the County, or County Borough, Education Authority for most students who are good enough to be accepted by a University (*see* E4 (1)). They are normally quite sufficient to keep a student at University without relying seriously on their parents for help Applications should be made normally in the final school year, and the Head of the School should be seen about these Every year an increasing number of industrial and commercial concerns, including the nationalised industries, offer scholarships for University courses Unlike Local Authorities' awards, the industrial scholarships do not always depend on a means test

State scholarships, which have hitherto been granted on the results of the G C E. examinations, are now only available for " mature students ".

Local Authority Grants —There are other forms of further full-time study for which grants are available from or through Local Education Authorities, and these include grants for Teacher Training Colleges, and for study in Technical Colleges for qualifications in Architecture, Surveying, Librarianship, or in special training schools such as for Medical Auxiliaries or Merchant Navy Cadets Sometimes, however, study for some of these types of career is caried out on a part-time or sandwich basis, and the student is paid wages by his employer for the time he is studying as well as for the time he is working As a general rule, if there is a choice between full-time or part-time study, full-time is the more advisable

The Armed Services —The Armed Services are very keen for study to be continued for as long as possible after school, and each branch of the Services runs its own Apprentice Schools (*see* E10, 11) The Navy, Army, and Air Force run their own scientifically biased Colleges at Devonport, Shrivenham, and Henlow, and also send selected Cadets to the University Valuable scholarships are also offered by all three Services to selected future sixth-formers to encourage them to stay on at school before going to Dartmouth, Sandhurst, or Cranwell, and the Army has its own sixth-form course at Welbeck All enquiries about Services should be made to the Director of Recruitment of the branch concerned, the particulars of which are given under the heading *Armed Services* below.

Where to apply for Grants —The sources to which parents should apply for grants are varied, and to compile a list of all the available awards and allowances would obviously require a junior encyclopædia to itself, and these remarks are meant only to give an indication of what may be done Full details from any particular body should be obtained as follows :—

(*a*) County Authority—The Chief Education Officer
(*b*) Large Firm—The Personnel Manager
(*c*) Arm of Service—Director of Recruitment of the Arm concerned
(*d*) University—The Registrar

G.C.E. AND THE PROFESSIONAL BODIES.

Mention has already been made of the advisability of staying at school as long as possible and, in view of the remarks above indicating the possibilities of financial help for those who need it to continue their full-time education, it may be of interest to note some of the professional bodies which either *accept* the O level of the G C E as providing exemption from their preliminary examinations or *require* the O level as evidence of preliminary education.

The number of subjects required varies slightly according to the professional body—but it is usually four, five, or six and in nearly every case English Language is an essential.

The professional bodies concerned are:—

The Association of Certified and Corporate Accountants
The Institute of Chartered Accountants
The Institute of Company Accountants
The Institute of Actuaries
The Advertising Association
The Royal Institute of British Architects
The Incorporated Association of Architects and Surveyors.
The Chartered Auctioneers and Estate Agents Institute
The Institute of Builders
The Building Societies' Institute
The Royal Institute of Chemistry
The Institute of Cost and Works Accountants
The Forestry Commission
The Royal Horticultural Society
The Chartered Insurance Institute
The Corporation of Insurance Brokers
The Law Society
The Library Association
The Institution of Mining and Metallurgy
The Institute of Municipal Treasurers and Accountants
The Association of Occupational Therapists
The Institute of Quantity Surveyors
The Society of Radiographers.
The Rating and Valuation Association
The Chartered Institute of Secretaries
The Corporation of Secretaries
The Royal Institution of Chartered Surveyors

This is not a complete list. Details for any particular professional body are set out in the Ministry of Education Circular No 226, which also gives their addresses. An increasing number of these bodies are raising their minimum requirements to **A** G C E level (notably Actuaries, Architects, Law). Others allow **A** G C E passes as an alternative to a wider range of **O** G C E. Some offer exemptions to certain graduates. For most of them, sixth-form experience will make qualifying professionally more likely.

CAREERS FOR GIRLS.

Girls are difficult. They often do not like to show too much interest in their future careers, because this might make people think that they were not expecting to get married. Nothing could be more ridiculous. The girl who has a career, especially a career for which training is needed, is probably far more likely to make a good marriage, than the one who just drifts out of school into the first available job. Here are four reasons why this is so

(1) The girl with a training will probably attract the better-educated man

(2) If a girl has a job which holds her interest she may well find a husband who also works in the same field—a shared interest is a good basis for a marriage

(3) The girl with a training will have something extra to give her children as they grow up, and so be a more satisfactory mother

(4) The mother who has training qualifications can go back to her profession after her children have grown up, this not only has the advantage of adding to the family income, but means that an escape from the home to an outside interest is always available should the desire, or indeed the need, arise.

Giving advice to girls is a specialist task, and often the Youth Employment Officer either is a woman or has a qualified woman assistant who can help girls who are still at school. Further advice may be had from the Women's Employment Federation, 251 Brompton Road, S W 3.

Careers open to girls today are no longer restricted to teaching, nursing and "secretarial," interesting and rewarding as these can be. Women can easily find jobs after being trained as accountants, engineers, and architects and, although most of us have yet to see a woman Bank Manager (there is one in the West End of London), the banks are more and more turning to women to take on responsible positions behind the counter, and often a specialist training in one profession or another, capped by a short secretarial course, can lead to some very interesting and rewarding positions as personal secretaries.

Finally, the advantages of a University degree to a girl who can and wants to continue her Sixth Form studies should be obvious, and no girl should be denied a University course just because it does not seem to lead to a job.

To avoid fruitless thumbing through jobs for boys only, here is a list of the jobs for girls, which are included in the next part of the section:

Accountancy, Advertising, Agriculture, Air Hostess, Almoner, Architect, Banking, Beauty Culture, Catering and Hotel Management, Child Care, Chiropody, Civil Service, Dentistry, Dietetics Dressmaking, Engineering, Floristry, Hairdressing, Hospital Administration, Hotel keeping, Institutional Management, Insurance, Journalism, Laboratory Assistant, Laundry Management, Law, Librarianship, Local Government, Medicine, Meteorology, Midwifery and Maternity Services, Museums, Music, Nursing, Occupational Therapy, Orthoptics, Personnel Management, Pharmacy, Photography, Physiotherapy, Police, Probation Service, Radiography, Science, Secretarial work, Singing, Speech Therapy, Surveying, Teaching, The Services, Veterinary Surgery.

LIST OF CAREERS AND ESSENTIAL DETAILS.

How to Use this List.

1. The careers are listed in alphabetical order, those which are available both to girls and to boys have the letters B G beside them, if only boys are eligible, B., if only girls, G

2. Opposite the heading "Qualifications," initials have been used to indicate the following —

Ordinary level of the G C E	.	**O**
Advanced level of the G C E.	.	**A**
Ordinary National Certificate	.	**O.N.C.**
Higher National Certificate	.	**H.N.C.**

3. The indications of salary given are meant as a rough indication of what a young person may xpect to start earning after qualification in the r concerned. In the rare cases where no ualification is required the starting salary is The upper levels of salary vary from job job in many cases, and therefore often the per end of the salary bracket has been omitted

ACCOUNTANCY.

B. G.

Age of Entry. 16-18 or Graduate

Qualifications. O or A or Degree

Pay. £900 to £1000 on qualification.

Aptitudes. Ability in use of figures, capacity for prolonged attention to detail and clear expression

Method of Entry.

1. Junior employment in Accountancy in either public service (*e g*, in local government) or industry.
2. As articled clerk (either in a firm of Accountants or in the Treasurer's Department of a Local Authority).
3. As a graduate in any of the above.

Further Study.

Intermediate Exam. of the Professional Body (after 2½ years).
Final Exam. of the Professional Body (after 5 years)

As the name implies, the accountant is the professional concerned with accounts of all descriptions in commerce, industry, and public affairs. The young person who starts on a five-year course of part-time study combined with daytime work as an articled or non-articled clerk must be prepared for a lot of hard work with comparatively little

money at the beginning. During five years of training he or she will be expected to acquire a sound knowledge of the theory and practice of Bookkeeping and Accounts, Auditing, Company Law, Law of Contract, Sales, Bankruptcy, Trusts, and related subjects.

The theoretical training is usually acquired from a correspondence course, although facilities are available in some areas at Local Technical Colleges. The cost of a complete course (including examination fees) is about £65, although this may be lower if Technical College courses are available.

Graduates entering the profession have three years only to serve under articles. Universities offering approved degree courses in Accountancy are Birmingham, Bristol, Cardiff, Newcastle, Hull, Leeds, Liverpool, London, Manchester, Nottingham, Sheffield, Southampton.

Once an accountant is qualified, advancement is very much a matter of his own initiative, record, and personality.

Note Before starting on a course of study, it is essential to find out from the professional body concerned the exact nature of their requirements, as the details vary considerably.

Addresses of Professional Bodies.

The Institute of Chartered Accountants in England and Wales, Moorgate Place, E C 2.

The Institute of Chartered Accountants of Scotland, 27 Queen Street, Edinburgh, 2.

The Institute of Chartered Accountants in Ireland, 7 Fitzwilliam Place, Dublin

ACTUARIAL WORK.

B. G.

Age of Entry. 18 or Graduate

Qualifications. A or Degree.

Pay. £1000 to £1500 on qualification

Aptitudes. Ability in Mathematics Must be able to develop powers of analysis and clear expression

Method of Entry. Through Life Assurance Offices or Government Actuary's Department, either straight from school or as Mathematics or Economics Graduate

Further Study. The professional examinations of the Institute of Actuaries, *i e*,

Entrance Examination (Good A level G C.E Maths exempts).
Intermediate, Associateship, and Fellowship Examinations

The Actuary is the expert on whom Insurance Companies rely for the calculations of insurance risks and the fixing of premiums. The would-be Actuary must be interested in and proficient at mathematics, which is going to provide him with the tools of the job. He (or she) must be prepared to continue part-time study in such subjects as Probability, Statistics, Finance, and Investment. For the qualified person there are plenty of openings at home and increasingly so overseas.

The Institute of Actuaries and their Scottish equivalent, the Faculty of Actuaries, run an Actuarial Tuition Service, which provides correspondence courses leading to the Associateship examinations of the bodies concerned The cost of the tuition service amounts to about £100 with examination fees of about £40.

Addresses of Professional Bodies.

The Institute of Actuaries, Staple Inn Hall, High Holborn, W C 1

The Faculty of Actuaries, 23 St. Andrew Square, Edinburgh.

Pamphlets.

ADVERTISING.

B. G.

Age of Entry. 16–18 or Graduate.

Qualifications O or A or Degree

Pay.
Juniors, £200–£250
Trainees, £400
Junior Copy Writers, £400
Graduates, £650

Aptitudes. Imagination, ability to mix and to express ideas briefly and to the point

Method of Entry. By direct application to firm or agency on leaving school (or University).

Further Study. Study for the Intermediate and Final examinations of one of the professional bodies

There is a great deal of competition for entry into this career, and the young man or woman wishing to go far will have to be prepared to learn while working and to develop a critical and independent mind Nowadays much advertising work is carried out by advertising agencies, and it is by and large only the biggest organisations which carry their own advertising departments

Agencies, in particular, have openings for specialists in the many activities connected with selling, *e g*, statistics, market research, commercial art, photography, technical production, and specialised overseas work These specialists are often brought into the business after qualifying or training in another field (graduates for statistics printers for space-salesmanship) The potential recruit would therefore be well advised to think carefully whether or not it would pay to gain specialist experience elsewhere first. There is no truth in the idea that one can afford to run an expensive car in this career by virtue of the ability to think of a new catch-phrase every morning

Although the examinations of the two Associations are not essential, the courses are a very good supplement to practical experience The Associations have a Joint Intermediate examination, but run separate Membership examinations In addition, the Institute of Practitioners in Advertising have an Associate Membership final examination designed for the "specialists" mentioned above

Addresses of Professional Bodies.

Choice of Careers Series, No. 44 (H.M.S.O.), 9*d*

AGRICULTURE.

B. G.

Age of Entry. 17+

Qualifications.

1. For Farm Institute Course—none
2. For Agricultural College Course—O
3. For teaching and advisory service—Graduate.

Pay.

1. For Farm Managers £600+.
2. For Commercial Agricultural Representatives—about £500+ and commission.
3. For Technical Officers of Ministry—£700+

Aptitudes. Genuine interest in the country and in farming. Ability to use one's hands

Method of Entry. Normally one year on farm, followed by —

1 year at Farm Institute, or
2 years at Agricultural College, or
3 years at University

Further Study Certificate Course (at Farm Institute), Diploma Course (at Agricultural College) or Degree Course (at University)

The young person who wishes to take up Agriculture as a career has normally to choose one of three ways of gaining the necessary knowledge and experience. Whichever way is chosen, it is highly advisable to spend a year on a farm gaining practical experience and making quite sure that this is the life one wishes to lead

Then for those who are interested chiefly in the practical side and who do not wish to pursue theoretical studies too far, the best choice is the 1-year course at a Farm Institute. This will fit them to become a skilled farm worker or smallholder

Those who intend to become farm managers, bailiffs or commercial representatives do better to follow the 2-year course at an Agricultural College. These are both residential and non-residential, and the course leads to the National Diploma

The last group are those who intend to become teachers or advisers in the service of the Ministry of Agriculture, Fisheries, and Food, or of County Councils. These are the ones who attend University and attain the B Sc (Agric) degree

There are, in addition to the three main methods of entry indicated above, the Agricultural Apprentice Scheme, and the "British Boys for British Farms" Scheme, which is sponsored by the Y M C A. The Y M C A also arranges for boys to contact farmers for their year's practical experience

The Apprenticeship lasts for three years. Apprentices are allotted to selected farms and, where necessary, arrangements are made for training to be carried on at more than one farm. The Y M C A scheme caters more for boys with a *town* background and has been operating successfully for more than 25 years

For those wishing to do research a degree is almost essential

Addresses

The Agricultural Research Council, Cunard Buildings, 15 Regent Street, S W 1

Ministry of Agriculture, Fisheries and Food (Education Branch), Great Westminster House, Horseferry Road, S.W 1

The Secretary, Y M C A, "British Boys for British Farms," 4 Great Russell Street, W C 1.

Pamphlets

Choice of Careers Series

No. 86, *Farm and Horticultural Workers* (H.M.S.O.), 1s. 9d.

AIR HOSTESS (AIR STEWARDESS).

G.

Age of Entry. 21–28

Qualifications. At least one foreign language

Pay. £446 10s a year during training plus £2 a week flying pay while under training. Thereafter starting at £618.

Aptitudes. Language ability, good diction, tact, and patience

Method of Entry. Posts are advertised in National Press.

Further Study Up to 13 weeks' preparatory training

The girl who wishes to be an Air Hostess must be prepared to face very stiff competition. The competition is, in fact, so great that the Airlines are able to demand very high standards of turnout, poise, and personality

The Air Hostess's work could be described as social work, as it involves not only the congenial task of handing round drinks and the food which has been prepared by the Air Steward but also catering for the many needs of the infinite variety of passengers, from babes in arms, sometimes unaccompanied, to worried old ladies who have mislaid their passports, or simply people who are feeling or being sick

It is a great advantage to have had nursing and catering experience when applying for these posts. There is traditionally a high "wastage rate" of hostesses through marriage, but it should not be overlooked that for those who wish to make a long career with an Airline, promotion possibilities are good—Flight Stewardesses and Senior Catering Officers are recruited from the ranks

Addresses

The Recruitment Manager, B O A C, London Airport, Middx

Personnel Services Superintendent, B E A, Bealine House, Ruislip, Middx

AIR PILOT (CIVIL)

Age of Entry 18–20 (23 for Graduates).

Qualifications A

Pay £1,100 + [illegible]pletion of training (+ allowances)

Aptitudes Highest standards of reliability, outlook, and physical fitness essential

Method of Entry. Acceptance by the College of Air Training, Hamble, Hants

Further Study. 2 years at College of Air Training

The very high cost of becoming a Civil Airline Pilot privately has, until recently, made this an impossible career for nearly all except those who have been trained by the R A F

Changes in the organisation of the R A F, and the end of National Service have meant that the Civil Airlines have been gradually losing their main source of recruits and there are now brilliant prospects for the young man who is good enough to secure a place at the new College of Air Training. The cadet will have a two-year residential course covering all aspects of flying, as well as general education

Those chosen will be sponsored by one or another of the Airlines, and the cost to the student's parents will be no more than what they would pay if he were attending a normal University course with Local Authority assistance.

There is no need for any air-minded young man considering this career to fear that he may be left "grounded" at a comparatively early age, as the tendency is for the ceiling age for active pilots to rise. Given physical fitness, pilots may expect to fly well on into their fifties

It must be emphasised, however, that competition for places is very keen, and only the very best type of candidate can hope to be accepted. The cost of training one cadet is between £4,000 and £5,000, and it is only to be expected that the Government and the Airlines, who between them

provide the money, should take the utmost care to ensure that the number of cadets failing the course is reduced to the absolute minimum.

Addresses.

The Chief Personnel Officer, B.O.A.C., London Airport, Middx

The Personnel Services Superintendent, B.E.A., Bealine House, Ruislip, Middx.

The Ministry of Civil Aviation, Ariel House, Theobalds Road, W.C.1.

The College of Air Training, Hamble, Southampton, Hants.

ALMONER. *See* **Social Work.**

ARCHITECTURE.

B. G.

Age of Entry. 18+.

Qualifications. A. Otherwise Intermediate or Final exam. of R.I.B.A. or equivalent or Degree.

Pay.

1. With Intermediate qualifications, about £600.
2. With Final qualifications, £900–£1,000

Aptitudes. Artistic ability, neatness and reasonable facility in mathematics

Method of Entry.

1. As articled pupil or junior assistant to Architect
2. 3-year full-time degree or diploma course at Technical College or School of Architecture, entering profession as assistant with Intermediate Exam of R.I.B.A. or equivalent
3. 5-year full-time course at School of Architecture, entering profession with Final Exam of R.I.B.A. or equivalent
4. Two years' practical work is also required, one of which must be post-graduate

Further Study

1. If entering as articled pupil or junior assistant, about 10 years' part-time study, leading to Final Exam. of R.I.B.A.
2. If entering after 3-year full-time course about 4 years' part-time study, leading to Final Exam of the R.I.B.A.

Young people who do not feel an almost compelling desire to become architects, and who have little in the way of artistic gifts, are well advised not to consider architecture as a career. The student, however conscientious, who does not have an artistic flair, is unlikely to be particularly happy or successful. This is not meant to imply that the qualified architect has an exciting career of cathedral designing to look forward to. This there might possibly be at some time or another, but much of the time—especially at the beginning of a career—will be spent in routine work. Even the qualified person starts, almost without exception, in the office of an established architect or in the Architect's Department of a Local Authority. This is partly because the newly qualified have to gain 12 months' practical experience and take a final examination in order to secure registration with the Architects' Registration Council. Another reason is that Architects—like Solicitors—are not allowed to advertise, and so the young free lance would find the odds heavily against him in his initial attempts to find work.

Address of Professional Body.

Royal Institute of British Architects, 66 Portland Place, W.1.

Choice of Careers Series, No. 16 (H.M.S.O.), 1*s*.

THE ARMED SERVICES.

All three Services today offer exceptional opportunities to those who enjoy community life, who wish to travel, and who have a sense of adventure. Space does not permit the giving of full details for each branch, and the following should be regarded as the barest of outlines only. Dealing first with entry through Non-Commissioned Ranks

(*a*) **The Army.**

Men and Boys.

Age of Entry. 15–30

Qualifications. Ability to pass selection test

Pay.

45*s* 6*d* per week (boy entrant) to £18 per week (all found) depending on rank, service, and married status

Aptitudes. In general, interest in outdoor life and sense of adventure.

Method of Entry.

1. Boys at 15+—to Junior Leader Regts and Army Apprentice Schools
2. Men —Apply Army Information Office

Further Study. Great variety of courses available. Type and degree of specialisation largely dependent on individual's ability

There are three Army Apprentice Schools and a number of Junior Leader Regiments, which give boys of school-leaving age thorough courses of training (including general education) lasting 3 years

When these boys join the colours they stand an excellent chance of early promotion to Warrant Officer or even commissioned rank. Their specialised training, which is developed and widened during their subsequent service, is also a very good preparation for skilled work in the civilian world when they are released

Men under 30 (in exceptional cases 33) have similar opportunities during service of up to 22 years. Great emphasis is laid on sport and recreational facilities are available wherever the Army is, at next to no cost. The grim barrack blocks and needlessly restrictive regulations are becoming increasingly a thing of the past

(*b*) **The R.A.F.**

Men and Boys.

Age of Entry 15–40.

Qualifications. Selection and Aptitude tests to be passed.

Pay. 45*s* 6*d* per week (boy entrant) to £18 per week (all found), depending on rank, service, and married status

Aptitudes. As for Army.

Method of Entry.

1. Boys at 15+—Aircraft Apprenticeship or Boy Entrant Training Schemes
2. Men —Apply R.A.F. Recruiting Office

Further Study. Unlimited opportunities for those who are able, and want, to continue specialised training

Boys who enter the Service on Aircraft Apprenticeships or the Boy Entrant Training Scheme are trained according to ability and aptitude in a variety of trades covering all branches of R.A.F. activity. Examples are aircraft engineering, radio, electrical, instrument and general engineering, telegraphist, photographer, catering. They are thoroughly prepared for their subsequent career in the R.A.F., and have every chance of early promotion to Senior N.C.O. and even commissioned rank. There are three R.A.F. Apprentice Schools at Halton, Hereford, and Locking.

Men who enter from the age of 17½ receive a thorough training in one of the twenty-two trade groups, and here again there is every opportunity of promotion for those who show intelligence and initiative

As with the Army, sport and recreational

facilities are outstanding, and the airman can leave the service after 22 years with a pension and a thorough knowledge of a trade which he can turn to good account in civilian life

(c) **Royal Navy and Royal Marines.**

Men and Boys.

Age of Entry. 15–28

Qualifications. Ability to pass Selection Test (Artificer Apprentice —O).

Pay. 45*s* 6*d* per week (boy entrant) to £18 per week (all found), depending on rank, service, and married status

Aptitudes. As for Army and R.A F

Method of Entry.

1. Boys —
   (i) As Junior Seaman or Junior Mechanic.
   (ii) As Artificer Apprentice.
   (iii) As Junior Marine.
2. Men (17½+) —
   (i) Apply Naval Recruiting Office
   (ii) Direct entry as Artificer—apply Naval Recruiting Office

Further Study. Within the framework of the Service, the new entrant is encouraged to study to as high a standard as his capabilities allow.

Although all men and boy entrants into the Royal Navy receive wide and thorough training to suit them for their eventual jobs, there is one particular type of entry requiring higher initial qualifications and larger specialist training This is for those who become Artificers, who serve a trade apprenticeship for 4 years in the course of which they are chosen for one of the Technical Branches Direct Entry as an Artificer (for men) is available for those who have done 4 years' civilian apprenticeship, and can pass a trade test, to become an Engine Room, Aircraft, Electrical Ordnance, or Shipwright Artificer Royal Marines train as a Commando, on sea service or as an amphibious unit

As with the other Services, promotion prospects up to and including command rank are good for those with keenness and determination, and many of the specialist skills acquired during service are of great use in later civilian life

General Note on Terms of Service.

It must not be forgotten that the Forces expect a fair amount of service in return for the very expensive training they provide, and the following is an indication of how each branch of the Services arranges its terms —

1 **Army.** Apprentices undertake to serve until 26 years of age + 4 years in Royal Army Reserve Service may be extended to 22 years, when there is a pension
2 **R.A.F.** Apprentices undertake to serve until 30 years old (boy entrants until 28 years + 2 in Reserve) At any time after the age of 22 an airman may be re-engaged until he is 55, but he keeps the right to leave at 40 with a pension
3. **Royal Navy.** All recruits except Artificer Apprentices have to serve 9 years (reckoned from the age of 18) Artificer Apprentices are required to serve 12 years (reckoned from the age of 18), as their training lasts so much longer.

Addresses from which detailed information about all three Services can be obtained —

1. *Army* The Under Secretary of State, War Office (M P 6), S W 1
2. *R A F* The Central Recruiting Office, Royal Air Force, Victory House, Kingsway, W.C 2.
3. *Royal Navy* The Director of Naval Recruiting, Admiralty, S W 1

No 54, *Royal Navy* (H.M S.O.), 1*s* 6*d*.

Commissioned Service (All Arms).

B.

Age of Entry 17–19.

Qualifications. Generally A, exceptionally O, for short service commission

Pay. The basic pay on commissioning is £558 p a

Given efficient service, promotion is automatic in the early stages in all three Services, thereafter it is by selection The pay of a Lt Commander, Major, and Squadron Leader is about £1,600 p a plus considerable allowances, *e g* , marriage, ration or flying allowances

Aptitudes. All three Services demand the highest standards of personality and integrity. Initiative, leadership, and self-reliance are essential qualities

Method of Entry.

1. *Army* —
   (i) To Welbeck College (the Army's 6th Form Public School), thence to Sandhurst after good A level results in science and mathematics
   (ii) To Sandhurst direct
2. *R A.F* —
   (i) To R A F College, Cranwell
   (ii) To R A F Technical College, Henlow
3. *Royal Navy* and *Royal Marine*.—
   (i) To Britannia Royal Naval College, Dartmouth
   (ii) Suitably qualified candidates by interview for training and 12-year Commission in Fleet Air Arm
   (iii) Royal Marine entry to Officers' School
4. All three Services have scholarship schemes to assist boys to complete their sixth-form studies at school with entry to officer training assured

Further Training The Officer training of the Service concerned, then study for promotion examinations and a great variety of specialist courses throughout Service career

Space does not allow the giving of detailed requirements and conditions of service Broadly speaking a candidate for a commission in any of the Armed Services must be of reasonable academic attainment (at least A level of the G C.E); must satisfy the Service Selection Board as to his suitability, and must be physically fit

Permanent Commissions are available in the Army and the R A F , for graduates wishing to enter the Service There is an ever-growing demand for entrants with scientific qualifications as the Services grow yearly more technical.

Short Service commissions for varying periods of years are also available in all three arms They are non-pensionable, but carry a handsome gratuity at the end of the contract, and opportunities exist for converting these commissions into permanent commissions carrying the normal opportunities of advancement and pension entitlements

No interested boy should be put off this career because of stories of the need for a private income The vast majority of serving officers nowadays live successfully on their pay Marriage, education, and disturbance allowances are generous

Pamphlet

No 68, *H M Forces, Commissioned Service* (H M S O), 1*s* 6*d*

THE WOMEN'S SERVICES (The Women's Royal Army Corps, The Women's Royal Air Force, The Women's Royal Naval Service).

G.

Age. 17½+.

Qualifications. None laid down

Pay. From £3 13s 6*d* per week on entry, all found.

Aptitudes. Liking for community life, willingness to travel, and ability to become proficient in a trade

Further Study. In all cases, to acquire proficiency in a trade In some cases, for promotion examinations

The Women's Services are designed to relieve pressure on the available man-power, and there is, therefore, a variety of interesting careers within the framework of each Service The following are examples of the main trades which can be studied and practised in each arm of the Services —

W.R.A.C. Catering, Clerical work, Electrical work, Motor Transport, Signals, Storekeeping

W.R.A.F. Aircraft Engineering, Radio work, Electrical work, Motor Transport, Air Traffic Control, General Engineering, Police, Radar Operating, Photography, Medical, Accounting, Supply, Catering

W.R.N.S. Radio work, Air Mechanic, Radar, Telegraphist, Cinema Operator, Clerical, Supply, Catering, Medical.

Pay is at about three-quarters of the equivalent rating for men, and after 22 years' service women are entitled to a pension At regular intervals they have the option of ending their Service, and can in any case withdraw on marriage if they wish

Officers are recruited (1) from the ranks, or (2) by direct entry Some enter after graduation

Terms of service for officers are somewhat complicated, and vary from branch to branch, but in essence, an officer either serves for a period of 20 years to earn a pension or has a short-service commission, which usually carries a gratuity

AUCTIONEERING OR ESTATE AGENCY.

B.

Age of Entry. 16–18.

Qualifications. O

Pay. £500–£600 (on qualification)

Aptitudes Ability to make clear judgments and master complicated detail

Method of Entry.

1. As Junior Clerk.
2. As Articled pupil
3. As Graduate in Estate Management.

Further Study. Part-time study for professional qualification.

There are two main branches of this profession, namely the urban and the rural. This is recognised in the examinations of the professional bodies, and the candidate is able to study in accordance with his own inclinations and background. Thus the young countryman will probably feel more at home studying Agricultural Science, and Husbandry and Farm Management, rather than Dilapidations and Fixtures and Domestic Sanitation

This glimpse of a section of the candidate's studies may serve to dispel the idea that all a qualified Auctioneer and Estate Agent has to do is to earn money through exercising a big voice and a small hammer

Indeed, through a combination of training, study, and experience, he has to become an expert in such matters as the money market, valuations, mortgages, construction and maintenance of buildings, and have more than a nodding acquaintance with the Law of Property and the Law of Contract.

The three ways into the profession are:

1. By service as a Junior Clerk combined with part-time study
2. By taking articles, which may cost over £200 for the premium This is a more satisfactory way than (1) above, and arrangements can often be made to pay the premium by instalments, or even to have it waived altogether.
3. By entry with a degree, which must be either the B Sc (Estate Management) of the University of London or the B A (Estate Management) of the University of Cambridge Both these degrees provide exemption from the professional examinations.

There are no laid-down salary scales for the profession at present, but a qualified successful man could expect to earn up to about £1,500 p a as Manager There are also some openings in the Civil Service for suitably qualified people.

Pamphlet

Careers for Men and Women, No 6 (H M S O), 9*d*

BANKING.

B. G.

Age of Entry. 16–18

Qualifications. O (or ability to pass Entrance Exam) or A

Pay. Juniors commence at about £300

Aptitudes. Integrity and ability to mix

Methods of Entry. By application to local or Staff Manager of Bank concerned

Further Study. For Diploma Examinations of Institute of Bankers (either Banking Diploma or Trustee Diploma).

Nowadays there are many opportunities in the world of banking for the keen boy or girl who is prepared to study and take a real interest in the job. Although the starting salary is modest, some idea of the prospects may be gained from the fact that out of every three young men joining a bank one can expect to become a Manager or executive of similar status The pre-war regulation whereby girls had to resign on marriage has now been largely withdrawn, and a keen, intelligent girl has good prospects of earning more than £1,000 p a. The widespread belief that the promotion—if it comes at all—comes only late in a career is without foundation today, and in most banks those who are going to go ahead are noted for promotion within the first 10–12 years.

Banks are well known as good employers. Encouragement (often financial) is given to continuing study, pensions are usually two-thirds of the eventual salary, and often non-contributory Assistance with house purchase is normally obtainable at rates which are far better than the man in the street can obtain from other sources Girls who do leave on marriage can expect a

"dowry" if they have completed a reasonable term of service

Addresses of Professional Bodies.

The Institute of Bankers, 10 Lombard Street, E C 3

Institute of Bankers in Scotland, 62 George Street, Edinburgh

Choice of Careers Series, No 67 (H M.S O), 1s

BEAUTY CULTURE.

G.

Age. Possible at 16+, but reputable firms usually wait till 24.

Qualifications. —

Pay. £7–£8 after 2 years (There are no fixed rates)

Aptitudes. Ability to get on with women, tact, self-confidence, and good manner of speaking

Method of Entry. Acceptance by private training organisation

Further Study. 3–12 months' training

The usual way of acquiring training is to attend a privately run school, fees for which vary, but which for a year's course are in the neighbourhood of £120 p a. Local Authorities rarely give grants for training. The courses, which are theoretical as well as practical, lead to a diploma issued by the School, and this is useful in obtaining a post For those who wish to run their own salons, there are often side courses in such things as Salesmanship, Display, and Management Many firms expect candidates to have done a preliminary course in Hairdressing (*see* E22 (2)) first

It must be emphasised that this is a tiring and often frustrating job, and the successful girls are the ones who can stand for long hours without showing strain, and who can keep even-tempered even when there is a long run of ill-mannered or inconsiderate clients

Addresses

BIOLOGY } BOTANY } *See* Science.

CATERING, HOTEL MANAGEMENT, DOMESTIC SCIENCE.

B. G.

Age. 15+ for craft training or apprenticeships 16 or 18 for management training

Qualifications. Preferably O A for management courses and teaching

Pay. £400+.

Aptitudes. Interest in making other people happy and comfortable, practical efficiency, interest in food and drink extending beyond greediness, organising ability

Method of Entry. As student in Technical College which runs a Hotel and Catering Course. (Addresses of these from Hotel and Catering Institute, or from Careers Pamphlet No. 15) Or a post obtained through the Youth Employment Service

Further Training. One to four years' part- or full-time study in a Technical College leading to Diploma or Certificate

Individual Colleges (*e g* , Battersea College of Technology and Westminster Technical College) give their own awards on satisfactory completion of their own courses, to an increasing extent Local Authority Technical Colleges are running courses in Hotel Work, including cookery, and students are prepared for the City and Guilds Institute Certificates Courses vary in length, and include practical experience in a hotel or restaurant, sometimes up to one year will be spent abroad Jobs in hotels, either as chefs or as assistant managers, are readily available to those who are well qualified, the pay is good and the prospects encouraging, but hotel work of all kinds is inevitably wearing, both physically and mentally, and good health and even temper are important pre-requisites

Girls often take the examinations of the Institutional Management Association which lead to posts in residential clubs, hostels, schools, and canteens There is a great demand for staff in these posts as well as for domestic science and housecraft teachers Demonstrating is not so easy to find

Addresses

Hotel and Catering Institute, 24 Portman Square, W 1

CHEMISTRY. *See* Science.

CHILD CARE *See* Social Work

CHIROPODY.

B. G.

Age 17+

Qualifications. O

Pay When qualified £525 to £870, more in private practice

Aptitudes. Interest in people, good eyesight, reassuring personality

Method of Entry. Acceptance by School recognised by Board of Registration of Medical Auxiliaries

Further Study. 3 years' full-time course leading to Final Professional Examination.

Chiropody—care of the feet—is becoming increasingly important nowadays This is borne out by the growing number of posts available in public service (hospitals and clinics) and large firms Probably the majority of qualified people still prefer, however, to go into private practice. When a practice is well established it can provide a very reasonable living, but there is always the difficult period when the new practitioner is getting himself known, and the beginner must be prepared for lean times at first

Private practice is attractive partly because one can equip oneself for the job for little more than £100.

Address

The Society of Chiropodists, 8 Wimpole Street, W 1.

Pamphlet

Choice of Careers Series, No. 61 (H M.S.O.), 6*d*.

THE CHURCHES.

B. G.

The Ministry or priesthood can hardly be considered a career in the same sense as most of the jobs in this section Financial reward is limited, and those who wish to enter the Church must be prepared for a lifetime of service to others and convinced of their own vocation This applies to all the Churches, and the first thing to do is to consult the minister of the church the candidate attends The following is the procedure where four of the main churches are concerned Girls cannot enter the priesthood of the Church of England or Roman Catholic Church, but they can become ordained ministers of various other churches.

(*a*) **Church of England.**

Age. Normally 23.

Qualifications. Up to 25 years old, normally a Degree After 25—A may suffice

Method of Entry. Application through Bishop to Central Advisory Council of Training for the Ministry.

Further Study. Normally a full-time University Degree followed by 2 years at a Theological College Modified arrangements are made for the training of those who wish to enter the Ministry later in life.

Address. The Secretary, Central Advisory Council for the Ministry, 9 Tufton St, Westminster, S W.1.

(*b*) **Roman Catholic Church.**

Age. Candidates for ordination must notify their intention from age of 13+

Qualifications. Usually O or A before acceptance into Seminary

Method of Entry. Via Parish Priest

Further Study. 6 years or longer in a seminary at home or abroad

(*c*) **The Methodist Church.**

Age. Preferably before 30.

Qualifications. Passing the Local Preacher's written examinations

Method of Entry. Via the Superintendent Minister of the circuit in which the candidate is a church member

Further Study. 3 or 4 years at one of six Residential Colleges affiliated to a University Course, probably including a degree

Address The Secretary, Ministerial Training Committee, 1 Central Buildings, Westminster, S W 1.

(*d*) **The Baptist Church.**

Age. Under 40.

Qualifications. Usually O

Method of Entry. Via the Association to which candidate's Church belongs

Further Study.

1. 3 to 6 years at a Baptist College including perhaps a degree course at University to which College is affiliated
2. Examinations prescribed by Baptist Union.

Address. The Baptist Union of Great Britain and Ireland, The Baptist Church House, 4 Southampton Row, W.C.1.

Other Addresses

The Careers Secretary, Conference of Missionary Societies in Great Britain & Ireland, 2 Eaton Gate, S.W 1

The British Council of Churches, 2 Eaton Gate, S W 1

The Education Officer, London Board of Jewish Religious Education, Upper Woburn Place, W.C 1.

The General Secretary, Presbyterian Church House, 86 Tavistock Place, W.C 1.

Salvation Army, 73 Queen Victoria St, E C 4

THE CIVIL SERVICE.

B. G.

There are three main classes of the Civil Service, which are dealt with separately below The openings in the Foreign and in the Scientific Civil Service are listed at the end of this section.

(*a*) **The Clerical Class.**

Age. 16–20

Qualifications. At least O or appropriate Civil Service examination.

Pay. £286–£796 p a

Aptitudes. Various, according to department involved, but in all cases a liking for general office duties.

Method of Entry.

1. By Clerical Class Examination
2. By interview if holding O.

The Clerical Class makes up the largest group of Civil Servants, and the work varies according to the department concerned Thus the Clerical Officer may have to compile statistics, prepare documents, check accounts, or to interview members of the public and deal with correspondence Newcomers to departments are systematically trained in the work they will be doing.

Opportunities exist within the Service for promotion to the Executive Class, either by internal examination or, in the case of Civil Servants over the age of 28, on merit Pensions are non-contributory (except in so far as dependants are concerned) There is usually a five-day week and holidays are generous Juniors are often assisted with lunch vouchers, and even lodging allowances Welfare and security of tenure are excellent

(*b*) **The Executive Class.**

Age. 17½–24.

Qualifications. A or appropriate Civil Service Examination

Pay £476 at age of 18 to £1,200 (basic grade)

Aptitudes. Sound judgment, initiative, sense of responsibility.

Method of Entry.

1. By Executive Class Examination
2. By interview if holding A or Degree

The work of the Executive Officer might be summed up as the detailed carrying out of policy that has been decided, and thus can carry a considerable amount of responsibility. As with the Clerical Class, training is given to new entrants to fit them for their duties, and some officers are chosen for specialist training in such fields as accountancy or statistics Those who show great ability have opportunities of promotion to the Administrative Class, and many more reach the grades of Higher Executive Officer, Senior Executive Officer, and Chief Executive Officer, with correspondingly bigger salaries

(*c*) **The Administrative Class.**

Age. 20½–24.

Qualifications. Normally a good degree, and/or appropriate Civil Service examination.

Pay. £768 to £1,271 (basic grade)

Aptitudes. Creative approach, judgment of highest order, capacity for involved and protracted original work.

Method of Entry.

1. Administrative Class Examination and interviews.
2. 1st and 2nd Class Honours Degree followed by tests and interviews.

The Senior Civil Servants in this Class are the people responsible for formulation of national policy in accordance with the wishes of the Ministers. These posts are among the hardest to obtain, and any boy or girl going to University with the intention of becoming an Administrative Class Civil Servant should not be disappointed if the goal is not reached.

The work involves giving expert advice to Ministers of the Crown, planning new proposals, giving flesh and blood to the wishes of Parliament, and the organising of departmental work. For the very best are the rewards of a Permanent Under-Secretaryship, and the attendant heavy responsibilities.

The foregoing is an indication of the structure and possibilities of the three main classes of the Civil Service. There are in addition many ancillary and specialist departments which offer attractive careers, such as the following:—

1. (Parallel to Clerical Branch) Assistant Preventive Officers, Cartographical Draughtsmen, Assistants in Scientific Civil Service, Foreign Service (Grade 6, Branch B)
2. (Parallel to Executive Branch) Officers of Customs and Excise, Assistant Experimental Officers in the Scientific Civil Service, Foreign Service (Grade 5, Branch B)
3. (Parallel to Administrative) Statisticians, Patent Examiners, Inspectors of Taxes, Inspectors of Factories, Scientific Officers, engineering posts, Foreign Service (Senior Branch)

Address.

The Secretary, Civil Service Commission, 6 Burlington Gardens, W 1

No 32, *The Civil Service, General, Scientific and Technical Posts* (H M S O)

DANCING

B. G.

Age. 9–15 (for entry to a Ballet School) Otherwise not after age of 17.

Qualifications. —

Pay.

1. Corps de Ballet, £10 11s per week
2. Revue Chorus work, £11 13s per week (These are London rates Television work, solo work, etc , may earn considerably more)

Aptitudes. Natural ability essential, determination, extremely good health, physical perfection.

Method of Entry. Acceptance by a School of dancing Royal School of Ballet offers Scholarships for boys

Further Training.

1. Ballet Schools: Dancing instruction combined with general education
2. Other Schools of Dancing 3–5 years leading to examinations of Royal Academy of Dancing and Imperial Society of Teachers of Dancing
3. 3-year training course (for intending teachers), *e.g.*, at Royal Academy of Dancing.

There are two main divisions of dancing as a profession—theatrical and teaching On the theatrical side many young people (girls especially) are attracted nowadays to ballet, and it must be emphasised that only those in the very highest flight can hope to win a position in a corps de ballet It is worth noting that the Royal Ballet School itself provides 85 per cent of the ballet companies of the Royal Opera House and Sadler's Wells There is a shortage of good male dancers, so prospects for boys are better than for girls.

Apart from ballet, revue work and television (increasingly) provide employment for those who are set on making dancing a career. Minimum pay is fixed by Actors' Equity. It is quite common for dancers to take up teaching when they retire from the stage. The teaching may be in private establishments, where the remuneration is by arrangement, or in State schools, where salary is in accordance with the terms of the Burnham Committee Report Others prefer to go for teaching from the outset, and the Royal Academy of Dancing runs 3-year training courses

While there are various scholarships available from the different schools, the fees are often quite stiff (for example, the Royal Ballet School fees are £153 p a for day pupils and £350 for boarders) Help may often be obtained, however, from the local Education Authorities, subject to means of parents

DENTISTRY.

B. G.

Age. 17

Qualifications. A

Pay.

1. In Public Service, £1240 to £1950 (basic grade)
2. In private practice—dependent on size of practice, but usually commences at £1240+

Aptitudes Calmness of manner, ability to instil confidence, manual dexterity

Method of Entry. By application to approved Dental School

Further Study

1. A Degree course
2. Diploma Course at dental school.

There is a great need nowadays for trained dentists of both sexes, both in private practice and public service The course of training is long (4½ years for those holding qualifications on entry as above in chemistry, physics, and biology, which enables them to gain exemption from Part I of the training course). It is also expensive for those who cannot get substantial assistance from Local Education Authorities or other sources (£400–£500 in addition to books and living expenses) But for those who are willing to make the initial sacrifices it offers an interesting and valuable career which, for once, is well rewarded, but the work is very demanding

One word of warning There is considerable competition for entry, and only very good candidates are accepted

There are Dental Schools in, or attached to, the following Universities: St Andrews, Queen's (Belfast), Birmingham, Bristol, Durham, Leeds, Manchester, and Sheffield Teaching hospitals and schools are The Edinburgh Dental Hospital and School, The School of Dental Surgery (Liverpool), Guy's Hospital Dental School, The Glasgow Dental Hospital and School, King's College Hospital Medical School, The London Hospital Dental School, The Turner Dental School and Dental Hospital (Manchester), The Royal Dental Hospital (London), and University College Hospital Medical School

Choice of Careers Series, No. 96 (H.M.S O), 9*d*.

DENTAL NURSE.

G.

Age. 15–17.

Qualifications. None laid down

Pay. £220–£595

Aptitudes. Neatness and pleasant, reassuring personality.

Method of Entry.

1. By application to Dental Hospital for course
2. By application to a dentist in private practice.

Further Training.

1. Full-time course (6 months-2 years, depending on Hospital)
2. By dentist in private practice during course of work

The Dental Nurse (or Dental Surgery Assistant, to give her her correct title) has to be a girl who can adapt herself to a variety of jobs connected with dentistry. She may be expected to look after the clerical and reception work of a practice, reassure patients before treatment (and comfort them afterwards), process X-ray photographs, and prepare materials for use by the dentist. In a hospital with a Dental Department her work will naturally tend to be more specialized

Full-time training can be had at the following institutions —

Guy's Hospital Dental School, S E 1

Eastman Dental Hospital, Gray's Inn Road, W C 1

London Hospital, Whitechapel, E 1

In the provinces at the Dental Hospitals of Bristol, Birmingham, Dundee, Manchester, Sheffield.

The details of these courses vary considerably from hospital to hospital, but in all cases, however, the students work for the Examination for Dental Nurses and Assistants, which is held annually in London

The pay is not startlingly good, but for the girl who enjoys giving service to others and meeting different types of people Dental Nursing offers a satisfying and interesting career

Address

The British Dental Nurses and Assistants Society, 2 Summer Street, Leyland, Lancs

Pamphlet

Dental Surgery Assistants. Available from the British Dental Nurses and Assistants Society

DENTAL TECHNICIAN.

B. G.

Age. 15–21

Qualifications.

Pay. £546 p a. upwards

Aptitudes. Ability with hands and liking for delicate manual work.

Method of Entry. Acceptance by dentist, hospital, or firm, as apprentice

Further Training. 5-year apprenticeship including 1 day part-time-release study per week.

The Dental Technician is the craftsman (or woman) who makes the various appliances used nowadays, such as dentures, bridges, and plates Apprenticeships are available with private dentists, hospitals and firms manufacturing the various appliances and, together with the practical experience they gain, apprentices have to prepare themselves for the Intermediate and Final examinations of the City and Guilds of London Institute, which are both practical and theoretical in their scope.

There is a constant demand for the services of Dental Technicians, and no skilled person need fear unemployment, but there may be difficulty in getting taken on as an apprentice.

Addresses

Associated Dental Technicians Section of the Society of Goldsmiths, Jewellers, and Kindred Trades, 329–331 Gray's Inn Road, W C 1

Union of Shop, Distributive & Allied Workers, 188 Wilmslow Road, Fallowfield, Manchester, 14.

DIETETICS.

B. G.

Age. 20–21

Qualifications. One of the following —

1. Degree in Household Science, Nutrition, Domestic Science, or Pure Science, plus at least 3 months' training in cookery
2. State Registration in Nursing, plus at least 3 months' training in cookery
3. Teacher's Diploma in Domestic Science, with perhaps additional qualifications in physiology and chemistry
4. Institutional Management Certificate plus approved educational exam
5. Associate Membership of Hotel and Catering Institute resulting from examination, plus approved 2-year course in catering

Pay. About £580–£955 p a (in some cases to over £1,000)

Aptitudes. Interest in people, organising ability, ability to think clearly

Method of Entry. Acceptance by one of the bodies running courses leading to one of the recognised Diplomas in Dietetics (see below)

Further Training Usually 12–18 months full-time theoretical and practical study

The dietician is concerned with the study of nutrition—the composition of food and how the body uses it A lot of the work is in hospitals, where the dietician is of great value in the treatment of illness, and training therefore includes a period in a hospital kitchen (hence the need to be able to cook). In the course of the job the dietician meets all sorts and conditions of people, from doctors and food specialists to refractory patients, and so must be prepared to exercise tact and discretion and to mix easily

The following hospitals are recognised for the training of Dieticians —

Belfast:	Royal Victoria Hospital
Birmingham	Queen Elizabeth Hospital
Cambridge.	Addenbrooke's Hospital
Dublin:	St Vincent's Hospital
Edinburgh:	The Royal Infirmary.
Glasgow:	The Western Infirmary.
Leeds.	The General Infirmary.
London:	The London Hospital. The Middlesex Hospital. St. Thomas's Hospital. University College Hospital

Address.

The British Dietetic Association, 251 Brompton Road, S.W.3.

Pamphlet.

Choice of Careers Series, No. 13 (H.M.S O.), 1s.

DOMESTIC SCIENCE. *See* **Catering and Hotel Management.**

DRAMATIC ART.

B. G.

Age. Normally 17–18 (18 for a teaching course).

Qualifications. Preferably O or A.

Pay.
1. £10–£12 per week minimum (in London)
2. As teacher—in accordance with Burnham scales.

Aptitudes. Acting ability, determination, good health.

Method of Entry. Usually acceptance by a school of drama.

Further Training. 2–3 years' full-time course at a school of drama

The first thing to say about acting as a career is that it is a very insecure profession, offering great rewards to the few, but very often frustration and disappointment to the majority—especially to girls. At any one time up to half the qualified actors and actresses are unable to get work in the theatre

For those who are nevertheless determined to make a career of the stage, by far the best way of getting training is to obtain a place at one of the schools of drama, the addresses of some of these are given below

On completion of the course, the next step is to obtain a situation with a Repertory Company, if possible, and so enlarge the field of experience Some lucky ones, of course, get recognition and "stardom" while training or even before, but this is very much the exception to the rule.

Some of the schools of drama mentioned above run courses for teachers of dramatic art These courses are recognised as a teacher's qualification by the Ministry of Education, and on this side the prospects are much brighter, as there is a growing demand in educational establishments of all descriptions for dramatic work in and out of the classroom

Addresses

The British Actors' Equity Association, 8 Harley Street, W 1

The Royal Academy of Dramatic Art, 62–4 Gower Street, W C 1

The Central School of Speech and Drama The Embassy Theatre, Swiss Cottage N W 3

The Guildhall School of Music and Drama, John Carpenter Street, Victoria Embankment, E.C 4.

The Rose Bruford Training College of Speech and Drama, Lamorbey Park, Sidcup Kent

Pamphlet

Choice of Careers Series, No. 98 (H M S O), 1s

DRAUGHTSMAN.

B G.

Age 15½–18.

Qualifications. Preferably O or first year of O N.C.

Pay. About £9 (at age 21)—£14+ (at age 25).

Aptitudes. Capacity for attention to detail, sound maths., ability to think for himself

Method of Entry. Apprenticeship

Further Training. 5-year apprenticeship including day release study at a technical college leading to technical or professional examinations.

It is a common mistake to think that all a draughtsman needs to have in the way of natural talent is the ability to draw well. His job is the preparation of scale drawings from which the various parts of, for instance, a machine are made He therefore needs to know enough engineering to be sure that the parts he is drawing will do their job and enough mathematics to calculate stresses by formula Most firms insist that their apprentices should have a thorough grounding in general engineering practice in various departments before the real drawing-office training begins. The apprenticeship, including part-time theoretical study, usually leads to examinations such as the Ordinary and Higher National Certificate and those of the Institution of Engineering Designers, the Institution of Mechanical Engineers, the Institution of Electrical Engineers among others

The work of a draughtsman is very satisfying for those who are interested in drawing and engineering, and it has very often proved a valuable stepping-stone to senior technical appointments in industry

Address.

The Institution of Engineering Designers, 38 Portland Place, W 1

Pamphlets

Choice of Careers Series (H M.S O.), No. 16, 1s , No 60, 1s 3*d* , No 87, 1s 9*d*

DRESS DESIGNING.

Usually G.

Age. Usually 15½–18

Qualifications None laid down

Pay. No scale: salary by arrangement

Aptitudes. Practical needlework, perseverance, knowledge of and interest in French and Art

Method of Entry
1. Learning while working in factory or workroom
2. Acceptance by Technical College or School of Art for full-time course

Further Training.
1. Training in factory or work-room supplemented by part-time technical or art college study (about 4 years).
2. Full-time course in technical or art college (2–4 years)

Dress Designing is not a well-defined career in the sense that so many in this section are Obviously all dresses have to be designed before they are made, but the majority are designed abroad and adapted for use in this country There are 3 fairly distinct classes of work —

1. "Haute Couture"—the designing of models for the famous fashion houses This is a "glamorous" job and only very few really outstanding people achieve posts of this nature Even for these, there is a great element of chance in the process of becoming recognised.
2. "Wholesale Couture"—the designing of models for restricted retail trade, usually based on the current fashion trends
3. "Wholesale Manufacture"—the designing of cheaper dresses for production in large quantities.

There is no guarantee of employment for those who have successfully completed their training, and a great deal of luck is needed (being, for example, in the right place at the right time).

Mention must be made of an alternative method of training at the Faculty of Dress Design of the Royal College of Art. Candidates for the 3-year

full-time course have to be between the ages of 17 and 25, and have to pass an entrance examination in five Parts. Part I is the submission of "testimonies of study" (i.e., examples of candidate's original work), and Part II is a more general examination testing the candidate's interests, command of English, and critical approach to contemporary trends in fashion. There is also a practical test.

For those who are accepted, the 3-year course includes Life Drawing, History of Costume, Designing, Dressmaking, Tailoring, Millinery, Accessories, Pattern Cutting, Children's Clothing, Lingerie, Shoe Design, and Jersey Wear. Successful graduates are entitled to style themselves Designer of the Royal College of Art (Des R C A).

There is also a course of training at the Barrett Street Technical College, Oxford Street, which is very suitable for those interested in wholesale designing.

Addresses

The Faculty of Fashion Design, The Royal College of Art, 20 Ennismore Gardens, S W 7.
The London College for the Fashion Industries, Oxford Street, W 1.

Pamphlets.

Choice of Careers Series (H M S O), No. 9, 1*s*. 3*d*., No. 10, 6*d*.

ENGINEERING.

B. G.

Space does not allow full treatment of this extremely complex career in all its aspects. The following should therefore be regarded as the barest outline of the main branches of the profession and, before any decision is reached, advice and full details should be obtained from the Youth Employment Officer and professional bodies concerned. These are *examples* only of engineering careers available and, it is hoped, will serve to indicate the general pattern. *See* Chart (E5)

Age. 16 (as an apprentice) and upwards, dependent on method of entry.

Qualifications. Dependent on method of training and branch concerned. O N C and (if possible) followed by H N C, for H N D, or Dip. Tech. either A level or good O N C.

Pay. From 54*s* per week (starting apprentice aged 16)—about £600–£800 p a. on completion of apprenticeship. Thereafter depending on branch of profession, but in region of £1,000 p a. at age 30. Further prospects depending on quality of individual up to £2,120 or more.

Aptitudes. All branches demand character and intellectual ability from those who are going to do well. All would-be engineers must possess qualities of patience and assiduity, and be interested as well in the special requirements of their particular field. They should have practical interest and ability.

Method of Entry. Usually—1. Apprenticeship, 2. Sandwich Course, 3. As a graduate.

Further Training.

1. *Apprenticeship.* Usually 5 years supplemented by part-time study at technical college, leading to examination of professional body concerned.
2. *Sandwich Course.* Usually 4-year course leading to (for example) Diploma in Technology. The course is usually alternate six-monthly periods of full-time study at a technical college (or CAT) and full-time engineering practice with a firm.
3. *As a Graduate.* A further period of "graduate apprenticeship" (about 2 years) is usually required. One of these years may sometimes be served *before* beginning the graduate course.

1. Aeronautical Engineering.

This covers a very wide field and includes design and construction of engines, airframes, guided weapons, and secondary equipment.

(a) *Trade Apprenticeship* (5 years) leads to jobs of Fitter, Machinist, Tool-maker, Sheet-metal Worker, Electrician, Pattern-maker. There are good opportunities for further promotion.
(b) *Engineering Apprenticeship* (for those holding O or A or equivalent) leading to posts in Design, Stressing, Aerodynamics, Laboratory, or Maintenance. Promotion prospects to executive level are excellent.
(c) *Student Apprenticeship* (for graduates and others) leading to senior technological positions.

Address

The Royal Aeronautical Society, 4 Hamilton Place, S W 1.

2. Automobile Engineering.

A specialised branch of mechanical engineering, sub-divided into Chassis Engineering and Body Engineering.

(a) *Trade Apprenticeship* (4–5 years) leads to skilled craftsman status in one of the following trades: Body Engineering, Body Jig-making, Carpentry, Electrical Maintenance, Fitting and Turning, Foundry Work, Machine Tool Fitting, Laboratory Work, Pattern-making, Press-tool Making, Sheet-metal Work, Tool-making, Welding.
(b) *Engineering Apprenticeship* (for those holding O or A or equivalent). These apprenticeships lead to posts in the following departments: (1) Development, Experimental, or Research, (2) Drawing Office, (3) Production, (4) Costing, (5) Service (Technical), (6) Sales.

Address

The Institution of Mechanical Engineers, (Automobile Division), 1 Bird Cage Walk, S.W.1.

3. Chemical Engineering.

The chemical engineer's main job is the design, construction, and operation of equipment in connection with manufacturing processes where there are chemical (and sometimes physical) changes.

(a) *Student Apprenticeship* with a suitable firm, combined with part-time study for O N C. and H N C is a common method of entry for those who do not take a degree. Regional Gas Boards offer interesting openings in Chemical Engineering.

Alternatively

(b) *Sandwich Course* at a Technical College or CAT, leading to Diploma in Chemical Engineering.

The two other main methods are —

(c) *Degree Course* in Chemistry, followed by post-graduate course in Chemical Engineering.
(d) *Degree Course* in Chemical Engineering.

Universities offering Chemical Engineering Degrees are: Birmingham, Cambridge, Durham, Glasgow, Leeds, London, Manchester, Sheffield, and Wales.

Technical Colleges or CATS offering Diploma Courses in Chemical Engineering are at: Birmingham, Glamorgan, Glasgow, London, Loughborough, Manchester, Neath, and Salford.

Address

The Institution of Chemical Engineers, 16 Belgrave Square, S.W 1.

4. Civil Engineering.

The term covers the design, construction, and maintenance of railways, roads, waterways, bridges, dams, tunnels, airports, etc. Municipal Engineering is the field of Civil Engineering concerned with municipal services, such as public

health, town planning, water supply, drainage, and surveying work.

(a) *Apprenticeship* is open to those with O (or who can pass the Common Preliminary Examination of the Engineering Joint Board), 3 years' practical and theoretical work, supplemented by part-time technical work to H.N.C. or a degree in engineering. 2 years' further practical experience is needed before qualifying for Associate Membership of the Institution of Civil Engineers.

(b) *Degree Course/Diploma in Civil Engineering Course*. These are available through Student Apprenticeships (sometimes Sandwich Courses) (see E7) or through full-time study at a Technical College or CAT or University. Entrance qualification A level. The courses are followed by 3 years' work (usually as a graduate assistant to an approved firm of civil engineers) before full status is gained.

Addresses

1. The Institution of Civil Engineers, Great George Street, S.W.1.
2. Institution of Municipal Engineers, 84 Eccleston Square, S.W.1.
3. Institution of Structural Engineers, 11 Upper Belgrave Street, S.W.1.

5. Electrical Engineering

This is a "blanket" term covering a very wide range of occupations, ranging from fundamental research and design to routine maintenance of installations.

(a) *Craft Apprentices* usually enter a works on leaving school. Those who show ability are encouraged to continue part-time studies leading to the City and Guilds of London Institute Electrician's Certificate.

(b) *Electrical Technicians* follow a course of practical training supplemented by part-time study at a Technical College, or in some cases they follow a course based on the "block-release" system (i.e., 4 weeks' full-time study alternating with approximately double the period work with the firm). The great variety of courses available and specialised training involved cannot be dealt with here, but mention may be made of the City and Guilds of London Institute Electrical Technician's Certificate, towards which the training of many technicians leads.

(c) *Professional Electrical Engineers* are trained either by following a full-time degree course at a University (or a full-time diploma course at a technical college or CAT), or by taking a Student Apprenticeship which involves a Sandwich Course and leads usually to H.N.D. after 4–5 years. In both cases further study and examinations are necessary before Associate Membership of the Institution of Electrical Engineers is obtained.

Address.

The Institution of Electrical Engineers, Savoy Place, W.C.2.

6. Mechanical Engineering.

Mechanical Engineering is concerned with the design, manufacture, and maintenance of machinery. There is a tremendous variety of work which comes within the scope of the Mechanical Engineer, and many of the other branches which are mentioned in this section need a good general grounding in mechanical engineering as a prerequisite of further training.

(a) *Craft Apprenticeship.* This is for youngsters leaving school who wish to make a career as skilled craftsmen. The apprenticeship lasts 5 years, and practical experience is supplemented by day part-time-release courses, evening courses, and, in some cases, Sandwich Courses. Apprentices prepare for City and Guilds or O.N.C. and H.N.C. and even higher qualifications. Those who do not follow their studies to this level are thoroughly trained as skilled workers in trades such as Milling, Turning, Fitting, Setting, Grinding, Foundry Moulding, Sheet-metal Working.

(b) *Student Apprenticeship*. This is a 4- to 5-year course (often Sandwich) for students who have passed O or A or equivalent examination. General background training is given, and the apprentice has the opportunity of specialising. Those who complete their training satisfactorily can expect to become responsible members of the staff of an engineering concern.

(c) *Graduate Apprenticeship*. This is designed to provide the practical background for those who hold degrees or diplomas in engineering. The course lasts about 2 years and is designed to fit graduate apprentices for posts in Research, Development, Design, Estimating, Contracting, Sales, and Production.

Address

The Institution of Mechanical Engineers, 1 Bird Cage Walk, S.W.1.

7. Mining Engineering

(a) *Coal Mining*. The National Coal Board runs its own system of training and apprenticeship schemes, full details of which can be obtained from the address below. Of special interest to Sixth Formers leaving school are the 100 University Scholarships offered each year by the National Coal Board for suitable boys who wish to take up mining engineering. These Scholarships are tenable at any University offering a mining-degree course, and the National Coal Board assumes entire responsibility for fees and maintenance—irrespective of parents' income. It should be noted that some scholarships are also available for degree courses in mechanical, electrical and chemical engineering.

Address

The National Coal Board, Hobart House, Grosvenor Place, S.W.1.

(b) *Metalliferous Mining*. Young men who wish to qualify as mining engineers in this sense of the word usually study for a degree or equivalent qualification at either the Royal School of Mines (South Kensington) or the Camborne School of Metalliferous Mining (Cornwall). It is also possible to specialise in Metalliferous Mining at some of the Universities offering Mining Engineering courses.

The work of a Mining Engineer who has specialised in this department of mining usually takes him abroad. He may be involved in discovering mineral deposits, extracting the ore from the ground or refining. There is a limited number of scholarships available, details of which may be had from the first address below. Candidates for courses must be aged 18 and hold A or equivalent.

Addresses

British Overseas Mining Association, 8 Great Winchester Street, E.C.2.

Institution of Mining and Metallurgy, 44 Portland Place, W.1.

8. Production Engineering.

The Production Engineer is concerned with every aspect of manufacture where planning of output in the most economical way is concerned. He is the expert on works management, production management planning, plant layout, jig and tool design, estimating, time-study, rate-fixing, motion study, process study, production control, inspection, purchasing, and stores control. He must be a man who can mix easily and command confidence and respect.

There are three main ways of becoming a production engineer:

(a) *Production Engineering Apprenticeship*. A 5-year course supplemented by part-time study for O.N.C. and H.N.C. and then for the Associate Membership Examination of the Institution.

(b) *Sandwich Course* (3–5 years) leading to H.N.C. in production engineering or Dip.Tech.

(c) *Engineering Degree* (3–4 years), followed by 2 years' practical work with a firm

Address.

Institution of Production Engineers, 10 Chesterfield Street, W 1

As already stated, the foregoing is a selection only of the various careers available in engineering The following is a list of the professional bodies associated with other branches of the profession and full details of method of entry, training, and prospects can be obtained from them:—

1 *Gas Engineering*

The Institution of Gas Engineers, 17 Grosvenor Crescent, S.W.1

2 *Heating and Ventilating Engineering.*

The Institution of Heating and Ventilation Engineers, 49 Cadogan Square, S W.1.

3. *Illuminating Engineering.*

The Illuminating Engineering Society, 32 Victoria Street, S W 1

4 *Marine Engineering*

The Institute of Marine Engineers, The Memorial Building, 76 Mark Lane, E C 3

5. *Radio and Electronic Engineering.*

The British Institution of Radio Engineers, 9 Bedford Square, W.C.1.

6 *Railway Engineering*

The Director of Training and Education, British Transport Commission, 222 Marylebone Road, N W 1.

7 *Water Engineering*

The Institution of Water Engineers, Parliament Mansions, Abbey Orchard Street, S W 1

8 *Welding Engineering*

The Institute of Welding, 54 Princes Gate, Exhibition Road, S W 7

FIRE SERVICE.

B.

Age. 19–31 (35 for ex-regulars from the Forces)

Qualifications Ability to pass simple education test

Pay. From £9 10s per week—over £1,000 p a. in Divisional Office posts.

Aptitudes Ability to serve as member of team, physical strength.

Method of Entry. By application to the Chief Officer of Fire Brigade in question.

Further Training. 2–3 months' course of training at a Brigade Training School

There are certain minimum physical requirements for a Fireman. He must be not less than 5 ft. 7 in. tall and be able to pass a fairly strenuous medical examination. Promotion to the rank of leading fireman is by examination after 2 years' service, and to the rank of sub-officer after 4 years' service.

There are opportunities for further advanced training at the Fire Service College for chosen officers Service is pensionable, and dependants are provided for in case of death.

Address

The Institution of Fire Engineers, 94 Southwark Bridge Road, S.E 1.

FLORISTRY.

G.

Age. 15+

Qualifications. None laid down.

Pay. About £6 per week as an assistant.

Aptitudes. Sense of colour and arrangement Pleasant manner and ability with hands

Method of Entry.

1. Assistant in florist's or, if possible, apprenticeship to florist.
2. Course at a School of Floristry.

Further Training.

1. 3-year apprenticeship to florist in conjunction with day part-time study leading to examination of Society of Floristry (London Area only).
2. Diploma course at a School of Floristry (9 months–1 year).

A florist's work involves not only the selling of flowers in a shop, but the designing and preparation of bouquets, wreaths, display baskets, etc , for special occasions, and the floral decoration of hotels and halls for functions and exhibitions

There are two schools in London offering full-time courses, and attendance at one of these is probably the better method of gaining a thorough grounding in all aspects of the work They are —

The Constance Spry Flower School, 29 Elm Tree Road, N W 8

The London School of Floristry, 1 Ravenscourt Park, Hammersmith, W 6

Addresses.

The Society of Floristry, 7 Henrietta Street, W.C 2.

British Flower Industry Association, 35 Wellington Street, Covent Garden, W C 2.

Book.

Making Floristry Your Business, by Angela Johnson (Southern Editorial Syndicate Ltd), 6s.

FORESTRY.

B.

Age.

1. Forest Workers, 15+.
2. Foresters, 19–30 (38, if ex-regular servicemen)
3. Forest Officer 21+

Qualifications.

1. Forest Worker —.
2. Forester—O
3. Forest Officer—Degree in Forestry

Pay.

1. Forest Worker, £8 10s per week.
2. Forester, £744–£1,076 p.a. (+ house or cash allowance).
3. Forest Officer, £595–£1,260 (minimum scale).

Aptitudes. High standard of fitness, liking for country life; self-reliance and ability to handle men, especially in Forester grades and above.

Method of Entry.

1. Forest Worker: By application to Youth Employment Officer or direct to a Forester.

2. Forester: By application to a Forester Training School (1 year's practical experience a prerequisite)
3. Forest Officer: Acceptance by Selection Board of Forestry Commission (for those holding degree).

Further Training.

1. Forest Worker. practical training while working.
2. Forester. 2-year course at Residential Forestry School (There may be a waiting list for these schools: 2 years' delay is not uncommon)

Work in Forestry is varied Forest workers are those who do the practical work in the woods, involving the care of trees, thinning, felling, and sawmill work. Foresters are in charge of areas of woodland, and Forest Officers are in overall charge of whole regions and concerned with long-term plans for development and afforestation. At present prospects of employment with the Forestry Commission in this country are limited, but there are various openings overseas for the last category through the Overseas Civil Service

In addition to the posts available with the Forestry Commission, attractive jobs are open to graduates in Forestry as managers of privately owned land, and in the timber trade

Addresses.

The Forestry Commission, Education Branch 25 Saville Row, W 1.

Royal Forestry Society of England and Wales, 49 Russell Square, W C 1

Empire Forestry Association, Royal Empire Society, Northumberland Avenue, W.C.2

Choice of Careers, No 81 (H.M S O), 1s 9d.

Training as a Forester. Available from The Forestry Commission

HAIRDRESSING.

B. G

Age 16+

Qualifications. None laid down.

Pay Apprentices: 34s to £3 10s per week. Men: £7 12s per week (minimum after 2 years)
Women £6 11s per week (minimum after 2 years)

Aptitudes. Pleasant manner, unruffled air, self-confidence cleanliness, artistic ability, manual dexterity, ability to stand for long periods, a good skin

Method of Entry

1. Apprenticeship to Master Hairdresser
2. Full-time course at School of Hairdressing under Local Education Authority auspices.
3. Full-time course at private school of hairdressing

Further Training.

1. As apprentice, 3 years, supplemented by part-time study
2. As student at School of Hairdressing sponsored by Local Education Authority, 2 years
3. As student at private school Usually 3–6 months. Some of these are not recognised by the trade, enquiries should always be made to the official bodies

The hairdresser, whether man or woman, is nowadays a member of a highly skilled profession offering an attractive career to those who are prepared to study and have a flair for getting on with people. It is pointed out that the above are minimum rates, and take no account of tips, which are a traditional aspect of the business

Apprentices and students at L.E.A.-directed Schools of Hairdressing study for the examinations of the City and Guilds of London Institute or the Entrance Examination of the Hairdressers' Registration Council. The courses at private schools are much more intensive and quite expensive (*e.g.*, £70 for a six-month course), but the period of study is, of course, much shorter. Grants are rarely allowed at private schools by Local Authorities, and in some cases their training is not recognised by the trade.

L.E A. establishments holding courses include:–

London College for the Fashion Industries, Oxford Street, W 1.

Erith Technical College, Belvedere, Kent.

Enfield Technical College, Queens Way, Ponders End, Enfield, Middx.

Watford College of Further Education, Queens Road, Watford.

Full details of courses in private schools can be obtained from the associations named below.

Addresses

The National Hairdressers' Federation, 20 Cranbourne Gardens, N.W 11

The Incorporated Guild of Hairdressers, 33 Great Queen Street, W C.2.

Pamphlet

Choice of Careers No 104 (H M S O) 2s

HEALTH VISITOR *See* Nursing.

HOSPITAL ADMINISTRATION.

B. G.

Age. 16–20

Qualifications. Usually O.

Pay. £260 at age 16 to £650 (on lowest grade)

Aptitudes. Initiative, good judgment, ability to mix

Method of Entry.

1. As a Junior Clerk.
2. As a graduate (limited number only)

Further Training. Part-time study in preparation for professional qualifications (very often the examination of the Institute of Hospital Administrators).

Hospital Administration is a term covering the work of about 450 hospital management committees right down to the day-to-day administrative running of a particular department in a particular hospital The clerk who gains qualifications as a result of part-time study and who is prepared to move from one part of the country to another has real opportunities for promotion

There are two stages in the examinations of the Institute of Hospital Management

1. *Intermediate*
   Part I comprises papers on Public Administration, Economics, and the Hospital and Health Services.
   Part II comprises papers on Secretarial Practice, Commercial Law, Book-keeping, Statistics (3 only to be taken)
2. *Final* (Candidates must have completed at least 3 years in Hospital Administration):
   Part I comprises papers on Hospital Administration, Hospital Finance, General Law affecting Hospitals.
   Part II. 3 subjects must be offered from a comprehensive list covering many of the aspects of Hospital Administration, *e g*, Accountancy, Supplies, Personnel Management, Records

All posts are pensionable, and holidays vary according to age and status.

Address.

The Institute of Hospital Administrators, 75 Portland Place, W 1

Pamphlet.

Careers in Hospital Administration. Available from The Institute

Choice of Career Series (H M S O) No 28.

HOTEL RECEPTIONIST. *See* **Catering and Hotel Management.**

INSURANCE.

B. G.

Age. 16–25.

Qualifications. Usually O but increasingly A

Pay. About £300 at age 17 Anything between £800 and £1,000 at age 25.

Aptitudes. Ability with figures and ability to express oneself clearly in writing. Pleasant personality and wide interests

Method of Entry. By application to secretary of company

Further Training. Part-time study for the examinations of the Chartered Insurance Institute

Insurance work falls into four main categories—Fire, Marine, Life, and Accident. Some insurance companies deal with all these branches, while others specialise in one only Some companies run their own training scheme for new entrants, or allow time off for study during office hours. Others send trainees on full-time courses of several weeks' duration All encourage their employees to study for the examinations of the Chartered Insurance Institute.

These are —

1. Preliminary (" A " entitles the new entrant to exemption)
2. Associateship (in 3 parts).
3. Fellowship (in 3 sections)

Each individual will take the advice of his employers as to which branch of study to follow up

After preliminary training, the young man has to decide whether he wishes to specialise in indoor or outdoor work The former leads to promotion to the position of chief clerk or superintendent for those who show promise, and there is ample opportunity for specialisation. The latter, involving probably more contact with people, leads to posts such as Inspector or Fire Surveyor.

While it is true that girls can follow a similar indoor career in insurance and are eligible for the same examinations, the majority of jobs for girls are of a clerical or secretarial nature Here the path of promotion is towards specialised clerical work, confidential secretarial posts, accountancy, or technical work

Some companies have a limited number of vacancies for graduate entrants in administrative and foreign posts

With most companies, welfare and pension arrangements are excellent and employees are encouraged to join the various sports and social clubs

Address

The Chartered Insurance Institute, The Hall 20 Aldermanbury, E C 2.

Insurance—a career for girls Available from The Chartered Insurance Institute.

That's a Good Job Available from the Chartered Insurance Institute.

JOURNALISM.

B. G.

Age. 17+.

Qualifications. Usually at least O + preferably a knowledge of shorthand and typing

Pay. £6 per week at 16 £14 to £15 at 24. These are minimum provincial scales.

Aptitudes. Ability to mix with all types of people, adaptability, initiative, and independence.

Method of Entry. Usually by application to provincial or suburban weekly.

Further Training. 5 years made up as follows.—

1. 6 months' probation.
2. 3 years' articled apprenticeship.
3. 18 months' course leading to National Diploma.

One of the most difficult things about Journalism as a career is actually getting started Many young people at school who develop an interest in writing feel that they would like to take up this career, only to find that it is very hard to get a job The best method is to write to the editor of as many provincial or local papers as possible, and of course be prepared to go where the work is Addresses of all newspapers can be found in *Willing's Press Guide*.

While waiting for a vacancy it is a good thing to work up proficiency in shorthand and typing.

It is sometimes possible to obtain a post on some newspapers as a graduate, and for graduate entrants (aged 24 or over) there is a special 2-year course leading to a Certificate of Training of the National Council for the Training of Journalists. The more normal method is, however, that outlined in the Further Training paragraph above, where, during the 3-year apprenticeship, the new entrant is trained in all aspects of reporting. At the same time the apprentice follows a part-time course (either by correspondence or at a Technical College) in English, Central and Local Government, British Life and Institutions, a special Law Course, and an optional subject

Full details of these courses and of the final 18-month course for the National Diploma are given in the *Handbook of Training* published by the National Council.

It should be emphasised that the salary details given above are the minimum provincial scale only, and for those who can really make their way in Journalism the rewards are considerable.

Addresses.

The Institute of Journalists, 2–4 Tudor Street, E C 4

The National Union of Journalists, 22 Great Windmill Street, W 1

The National Council for the Training of Journalists, 6 Carmelite Street, E C 4

LABORATORY WORK. *See* Science, *also* Medical Laboratory Technology.

LAUNDRY MANAGEMENT.

B. G.

Age. 16+.

Qualifications. Preferably O.

Pay. Depending on age, experience, and responsibility, but minimum rates are laid down in Orders of Laundry Wages Council

Aptitudes. Ability to handle varying types of people.

Method of Entry.

1. By application to a firm.
2. Acceptance on full-time courses (minimum age 18 years).

Further Training.

1. *Learnership Scheme.* Practical training and background instruction during work, supplemented by part-time study for appropriate examinations of City and Guilds of London Institute
2. 3-year *Apprenticeship.* Available for boys only and in a few firms only, supplemented by part-time study as in (1) above.
3. *Trainee Manager/Manageress Scheme* Available for suitable persons of 18 years and over.
4. *Full-time Laundry Management Course.* 2 years. Candidates must hold O and be 18 years or more.

There are over 4,000 laundries in the country, and there is considerable scope in this still-expanding industry for the ambitious boy or girl who is prepared to work hard. There are basically three processes in laundry work sorting of articles with regard to treatment, washing or cleaning, and finishing (i e, ironing or pressing), and the would-be manager or manageress must become thoroughly acquainted with, and have practical experience of, all the processes involved. The apprentice or learner must also become familiar with business methods and management techniques There is plenty of exacting work for an intelligent boy or girl who is prepared to study hard.

In addition to the usual Local Education Authority Grants, which may be available for many who wish to follow a full-time course, the Laundry Industry offers some scholarships Full details can be obtained from the first address below

Choice of Careers Series, No. 70 (H.M S.O), 1s. 3d

LAW.

B. G.

(a) Barrister.

Age No person may be called to the Bar before the age of 21

Qualifications.

1. A or degree
2. The "keeping" of 12 terms (see below)
3. Success in Bar Examinations

Pay.

1. In private practice, income depends on many factors, mention of which is made below
2. In Civil Service and with private undertakings—about £900-£2,000, or even higher

Aptitudes. Clarity of thought and language Good health Wide general knowledge

Method of Entry. Acceptance by one of the Inns of Court as a student.

Further Training. At least 12 months as a pupil of a practising barrister. Then perhaps a further period of "devilling" (see below)

The Bar is the senior branch of the profession, and only a barrister can plead in the higher courts

The profession of barrister (in private practice) while being one of the most respected is, initially, at least, one of the most precarious. First, admission to one of the Inns of Court has to be obtained and the fees have to be paid The four Inns and the composite fees are as follows —

The Inner Temple £56 17s 6d
The Middle Temple £56 16s. 0d.
Lincoln's Inn £56 16s. 0d. (+ £12 composition fee).
Gray's Inn £56 16s

The student then has to "keep" 12 terms, i e, dine in Hall on any 6 days of each term Students who are studying for a University degree at the same time are allowed to "keep term" by dining in 3 times a term only. The Bar Examination is divided into two parts, as follows:—

Part I. Roman Law; Constitutional Law and Legal History, the Law of Contract and Tort; the Law of Real Property, Criminal Law.

Part II Criminal Procedure; General Principles of Equity, Company Law and either Practical Conveyancing or Divorce Law or Public International Law; Evidence and Civil Procedure, a special subject; a general paper.

The next step is to be "called," which is the slightly ritual acceptance of the student into the profession (providing the Call Fees have been paid).

At this point the young barrister has to decide whether there is enough money available to continue into private practice. This will entail a premium of up to 100 guineas for the privilege of working for an established barrister and so learning the practical side Thereafter the new barrister *may* be lucky enough to be asked to "devil," i e, to carry on the more humdrum and routine tasks for a nominal salary This devilling is an important period in the barrister's career, as it is at this time that he makes the necessary contacts for establishing his own practice (It should be remembered that advertisement is not allowed) When finally a private practice is set up several lean years must be anticipated before the newcomer is well known by the solicitors who are to provide him with briefs

Many barristers prefer to take appointments either with the Civil Service or with large private firms which retain legal staffs This is indeed often the only way of making a career for those who cannot afford the substantial outlay involved in embarking on private practice

The Scottish system is entirely different, and information can be obtained about how to become an Advocate in Scottish Law by application to the Faculty of Advocates at the address given below

Addresses.

The Inner Temple, E C 4

The Middle Temple, E C.4.

Lincoln's Inn, W C 2

Gray's Inn W C 1

The Faculty of Advocates, Parliament Square, Edinburgh

The Council of Legal Education, 7 Stone Bldgs, Lincoln's Inn, W C 2

(b) Solicitor.

Age. No person under the age of 21 may be admitted as a Solicitor.

Qualifications. A (to commence articles), or degree

Pay

1. About £850 p a on first qualifying as a Managing Clerk in private practice.
2. *Public Service*, about £985 (starting salary)—over £2,000 in some cases

Aptitudes. Tact, patience, integrity, capacity for detail, interest in people.

Method of Entry As articled clerk to solicitor, in private practice or in public service, e g, Town Clerk

Further Training. 5 years from taking of articles (3 years for a graduate) combined with part-time study for the Law Society's Intermediate and Final Examinations.

The demand for solicitors exceeds the supply and many responsible and well-paid appointments are held by women

The solicitor comes into contact with the public chiefly when they need legal advice or representation, especially in connection with the purchase and sale of houses, the making of wills, matrimonial affairs, and general litigation. Not so well known is the whole aspect of Company work involving the flotation of companies, bankruptcy, and company law generally

During articles (for which a premium is less often required), a clerk must attend at a recognised law school for legal instruction on either a full-time or part-time basis. Exemption is allowed for barristers, graduates in law, and clerks with 10 years' experience or more.

The Intermediate Examination of the Law Society is in two parts, which may be taken separately Part I consists of Real Property Law, Law of Contract and Torts, Public Law, Constitutional Law, and Criminal Law Part II is concerned with Accounts and Book-keeping.

The Final Examination consists of Real and Property Law, Law of Trusts and Succession, Tax

Law, Contract, Tort, Company Law, and Partnership Law.

Once admitted, the new solicitor has the choice of aiming for a private practice or going into Public Service. In the former case the usual thing is to secure a post as a managing clerk with a firm of solicitors with the idea of eventual partnership in mind. For those who choose Public Service, prospects of promotion and increased responsibility are very good.

The Scottish system is slightly different, and information about how to become a solicitor in Scotland can be obtained from the second address below.

Addresses.

Choice of Careers Series, No. 26 (H.M.S.O.), 1s

Lawyers in the Government Service Available from The Civil Service Commission, 6 Burlington Gardens, W.1.

LIBRARIANSHIP.

B. G.

Age. 17–20.

Qualification. O (After 1 Jan 1964, A or degree)

Pay. £390 to £630 p a. £815 after qualification

Aptitudes. Methodical mind, capacity for detail, good memory, friendly demeanour.

Method of Entry. By application to Librarian of a Public Library

Further Training.

1. Part-time study for the First Professional Examination Then—
2. 1 year's full-time or 3 years' part-time study for the Registration Examination.
3. After 1964 (*a*) 1 year full-time or 3 years part-time for Intermediate Examination (*b*) 1 year full-time or several years part-time for Finals.

Librarianship is a term covering not only the services of the Public Libraries but also the University and College libraries and those of the learned and professional bodies. Very often in the case of the latter, very high academic qualifications are demanded, and in this section we are chiefly concerned with the public-library system as a career. The Junior joining a staff will find that at first a lot of time is spent in routine matters—the arranging of books, filing and indexing, and counter duties At the same time the beginner will be expected to study for the Examinations It is pointed out that "O" standard in one foreign language or a science subject is an advisable qualification, as this is a compulsory requirement for the Registration Examination, which has to be passed before any real promotion can be expected in the service.

Graduates who wish to acquire library qualifications can follow the Diploma Course of the London School of Librarianship and Archives (1-year, full-time).

The general salary pattern in the Library Service is that juniors and those who are not yet Chartered Librarians (*i.e.*, aged 23, with 3 years' service, having passed the Registration Examination) are not very highly paid, but for the qualified man or woman the range extends through seven grades to over £2,000 p a. Promotion, however, is slow, and very often entails moving to another part of the country in order to take a higher post.

Address.

The Library Association, Chaucer House, Malet Street, W.C.1.

Pamphlets.

Choice of Careers Series, No. 4 (H.M.S.O.), 9d.

The Library Profession. Available from The Library Association

LOCAL GOVERNMENT SERVICE.

B. G.

Age. Usually 16.

Qualification. O for entry into General Division. A or degree.

Pay. £270–£655 (General) Other Divisions and grades correspondingly higher.

Aptitudes. Impartiality, sense of duty.

Method of Entry. By examination, interview, in reply to advertisement, or through the Youth Employment Service.

Further Training. Part-time study for the appropriate professional or technical examinations.

Local Government is a term covering the work of the following types of local authority: County, County Borough, Borough, Metropolitan Borough, Urban District, and Rural District These authorities are responsible for the administering of a very wide range of public services *e g*, education, public health, housing, road work, police, fire services, civil defence, welfare, libraries, swimming-pools, playing fields, etc

There are about 180,000 Local Government Servants in England and Wales They are divided into the following classes:—

(i) General.
(ii) Clerical.
(iii) Miscellaneous.
(iv) Administrative, Professional and Technical (known as A.P.T.) which is subdivided

The school-leaver will normally enter the General Division, and his or her subsequent career depends on record and the passing of the appropriate examinations

It is important that one should start in a branch of Local Government in which one's own inclinations and preferences for a particular type of work can be developed.

The main departments are —

1. **The Clerk's Department**, which looks after the legal side of Local Government. There is considerable variety of work, and it is often possible to arrange to serve under articles (*see* **Law**) Highest positions are increasingly reserved for graduates
2. **The Treasurer's Department**, which is responsible for the finances of the authority The ambitious beginner will study for accountancy qualifications (*see* **Accountancy**)
3. **The Housing Department**, which is in many authorities steadily increasing in importance Architects Surveyors, Engineers, Managers are all required, and facilities exist for acquiring professional status in many aspects of the work
4. **The Engineer's Department.** A professional Engineering qualification, acquired either before or during service, is essential for those who seek promotion The department is concerned with roads, drainage, sewerage, municipal buildings, and general development (*see* **Engineering**)
5. **The Public Health Department.** Under the control of the Medical Officer of Health, this is concerned with the general health of the public School Medical and Dental Officers, Public Health Inspectors, Food Inspectors Health Visitors, Midwives, etc., belong to this department
6. **Education Department**, which is responsible for the administration of the Schools, Further Education Colleges, Youth Service, and Youth Employment Bureaux. The higher posts in this department offer an alternative career to those who have teaching experience (who are not themselves Local Government Officers) and indeed are usually reserved for former teachers.

All these departments, as well as the others which have been mentioned, require administrative and clerical employees in addition to the specially qualified technical people, such as doctors and engineers, and there is certainly no need for boys or girls to feel that by entering the Service at school-leaving age they are condemned

to a humdrum life on a third-rate salary for the rest of their days. The interests of staff are looked after by the National and Local Government Officers Association, posts are pensionable (contributory), and welfare arrangements are good

MEDICAL LABORATORY TECHNOLOGY

B. G.

Age. 16+

Qualifications. O or A

Pay. £335 p a (at age 16), £650 p a (at age 25), then (when qualified) £825 p a, with possibility of higher appointments

Aptitudes. Patience, interest in science, attention to detail, reliability, manual dexterity

Method of Entry. By application to the Area Pathologist of the Hospital Management Committee or to the Government Department concerned

Further Training. Part-time study for the examinations of the Institute of Medical Laboratory Technology A level in sciences exempts from intermediate examination.

Medical Laboratory Technology is the study and practice of the technical methods used in laboratory work to ascertain the nature of diseases usually from specimens of body tissue, blood, etc It is of great interest to the school-leaver who is interested in science and prepared to continue studies in spare time The work is such that the pathologists under whom the technicians work must have absolute confidence in the reliability and accuracy of their juniors

The beginner has to obtain a post as indicated above, and then apply for registration by the Institute as a student Much of the practical instruction is by a Senior Technician in the course of duties The Intermediate Examination of the Institute is taken after 3 years' experience and thereafter, having gained the status of a Junior Technician, the young man or woman has a further 2 years' part-time study for the Final Examination

There is continuing development in the Health Services, and prospects for new entrants are reasonably good

Address

The Institute of Medical Laboratory Technology, 74 New Cavendish Street, W 1

MEDICINE.

B. G.

Age. 17 years 9 months (minimum)

Qualifications. A in chemistry, physics, biology Sometimes O + Pre-Medical Examination (First M B.).

Pay.

1 Hospital Service about £675 p a to over £3,000 (Consultants)

2 General Practice, depending on size of practice. In the National Health Service there is a capitation fee for every patient on doctor's list up to £3,500 |

3. In Public Health, Industry, Armed Forces, Colonial Medical Service, about £1,300 to over £3,000.

Aptitudes. Patience, calmness of manner, interest in other people, capacity for hard work, integrity.

Method of Entry. Acceptance as a student by one of the Medical Schools.

Further Training. At least 5 years' full-time study for degree or diploma, followed by one year as a "house-surgeon" in a hospital

It is important for the would-be doctor to ensure, while still at school, that the Sixth Form syllabus being followed is the best preparation for medical training A level in chemistry, physics, and biology (for London Hospitals, Zoology) means exemption from the First or Pre-Medical Examination, which otherwise entails a whole year's study at a Technical College or Medical School It must also be remembered that expenses may be even heavier than in other forms of training, and although help is available from Local Education Authorities and through Scholarships, this is bound to be an anxious time for parents of moderate means

When the student has passed the Final Examinations of the course he is following, he or she has to spend 1 year as a house-surgeon in an approved hospital or institution before starting in a practice Doctors in general practice need to have great reserves of physical strength, patience, and endurance Unless they can come to some sort of "duty" arrangement with other doctors practising in the locality, or unless they work in a partnership, they must expect to have little time they are certain to be able to call their own

Many newly qualified doctors prefer to work for public authorities or in large industrial or commercial concerns, where at least work is usually in line with office hours For those who like community life, the Armed Services offer a secure and well-paid career with the opportunity of seeing much of the world

The following is a list of the Medical Schools which offer courses in Medicine

Aberdeen University
Belfast, Queen's University
Birmingham University
Bristol University
*Cambridge University
Cork, University College
Durham University
Dublin —
 Trinity College
 University College
 Royal College of Surgeons
Edinburgh University
Galway, University College
Glasgow University
Leeds University
Liverpool University
Manchester University
*Oxford University
St Andrews University
Sheffield University
Welsh National School of Medicine, Cardiff
London University—
 St Bartholomew's Hospital.
 Charing Cross Hospital
 Guy's Hospital
 King's College Hospital
 London Hospital
 Middlesex Hospital
 St George's Hospital.
 St Mary's Hospital
 St Thomas's Hospital
 University College Hospital.
 Royal Free Hospital
 Westminster Hospital.

* These universities offer only the pre-clinical 3-year course Except in rare cases the clinical period of training, another 3 years, must be done elsewhere

MERCHANT NAVY.

B.

Age.
Navigation Officers, 16–17½.
Engineer Officers, 16+.
Radio Officers, 16½+

Qualifications.
1. O or A
2 Ministry of Transport Eyesight Certificate.
A level may shorten apprenticeship for Navigation Officer

Pay.
Navigation Officers, £50–£170 per month on completion of training.
Engineer Officers, £42–£156 per month on completion of training
Radio Officers, £28 10s–£71 per month on completion of training.

Aptitudes. Self-reliance, capacity for unstinted work, first-class eye-sight, physical fitness, sense of adventure

Method of Entry.

(a) *Navigation Officer*
1 By acceptance at Training School (see address below).
2. By application to shipping line

(b) *Engineer Officer.*
1. By apprenticeship in heavy engineering, marine works, or shipbuilding yard
2. Acceptance by a shipping company on full-time Technical College course, combined with seagoing and workshop experience

(c) *Radio Officer* Acceptance in a school to train for Postmaster General's Certificate.

Further Training.

(a) *Navigation Officer.*
1 Course of pre-sea training at approved training school plus shortened apprenticeship
2. 4 years' apprenticeship with shipping line.

(b) *Engineer Officer.*
1. 4 years' marine engineering experience ashore plus 18 months' sea service
2. 4 years' apprenticeship with shipping company.

(c) *Radio Officer.* 12–16 months' training for the Postmaster General's Certificate.

As will be gathered from the above, careers in the Merchant Navy fall usually into the categories of Navigation, Engineer, and Radio. The future Navigation Officer has to study as an apprentice for the Certificate of Competency, which qualifies him as a Second Mate. After a further 12 months at sea he is able to sit for the First Mate's Certificate, and 2½ years later for the Master's Certificate During this sea time he can pursue his studies by correspondence course

The pattern for Engineer Officer is similar, except that the 4 years' apprenticeship is on land in a works preferably connected with the shipbuilding industry. On completion of his apprenticeship the young engineer spends 21 months at sea before taking the Second Engineer's Certificate and a further similar period before the Chief Engineer's Certificate There is an alternative method for boys with O level or equivalent qualifications which comprises 2 years' full-time Technical College work followed by 18 months' practical engine-room experience at sea, and a further year in a shipyard or engineering works

The necessary qualifications for a Radio Officer have to be obtained before the beginning of service afloat, and it is a wise precaution to ensure that one has the necessary physical requirements before starting a course, in order to avoid possible disappointment later.

Radio Officers are employed by the Radio Companies, and not by the shipping companies, and application should be made to the former

The life of a Merchant Navy Officer varies according to whether he is employed on "home" or "foreign" work (*i e*, short-range or long-range shipping) and according to the type of ship he is working For example, an officer on a deep-sea oil-tanker may spend relatively long periods away from home, but this is compensated by longer home leave. The social demands on board a large passenger liner will, of course, be greater than if one is serving on a little cargo vessel But the qualities required in every branch and on every type of ship are the same—trustworthiness, intelligence, ability to get on with others, and willingness to take responsibility. For those possessing these qualities, the sea offers a fine and interesting career

MIDWIFERY. *See* **Nursing.**

MUSIC.

B. G.

Age. 16 (for professional training) 18 (for teacher training)

Qualifications. O, preferably A for teacher training

Pay. As a teacher in State system—in accordance with Burnham scales Otherwise—very varied.

Aptitudes. Natural talent and strong constitution.

Method of Entry. Acceptance by a school of music or University.

Further Training. 3–6 years at school of music, leading to a diploma or degree

The person who studies music with a view to making a career has two courses open. He or she

can study to become a professional performer or a teacher. In the former case it must be realised that competition is very great, and only those who are at the top of their "class" and able to stay there can hope for the "glamorous" solo work. There has been recently, however, an increased public demand for music, and prospects of getting an orchestral post are perhaps slightly better for the good performer than they were in the past. This growth (or revival) of interest in music in this country means that there is also more for the trained teacher to do.

The boy or girl who wishes to take up music professionally must be proficient enough to pass an entrance examination if he or she wishes to follow a full-time School of Music course. The addresses of the best known of these schools are given below.

These courses cater for both would-be performers and teachers, and for the latter there is the alternative of a University course leading to a degree in music. These degrees are offered by the Universities of Birmingham, Bristol, Cambridge, Dublin, Durham, Edinburgh, London, Manchester, Oxford, Sheffield, Wales and the National University of Ireland.

The profession of music is in many respects more of a vocation than a career, and only those who have a real determination to devote their lives to this branch of the arts and sufficient character to withstand the boredom of repeated rehearsals, and the often straitened circumstances of a musician's life, should embark on such a hazardous undertaking.

NURSING.

Usually G, but B, much in demand.

Age. 18–30 (for beginning of training)

Qualifications. Preferably O, but not essential, though increasingly A is required

Pay. £525–£656 (for Staff Nurse)

Aptitudes. Interest in people, good health, even temper, tact

Method of Entry. By application to Matron of approved hospital.

Further Training. At least 3 years until State Registration

Nursing nowadays is a profession which appeals to many young women who wish to make a career in the service of others. Training for State Registration (S R N) cannot begin until the age of 18, and girls who leave school at 15 are often at a loss as to what to do with the intervening 3 years. Those who have the opportunity of staying in a Sixth Form are well advised to do so, as Sixth Form work is a useful preparation for the further study the student must tackle.

There are the alternatives of the pre-nursing courses which are run by some schools and technical colleges, and the cadet schemes which are run by some hospitals.

Training (which is resident) lasts for 3–4 years (except for Fever Nursing, which is a 2-year course). Registration may be obtained in: (i) General Nursing; (ii) The Nursing of Sick Children, (iii) Fever Nursing, (iv) Mental Nursing; (v) The Nursing of Mental Defectives. It is considered advisable to qualify in General Nursing as a basic training, whichever branch is taken up later.

There is an alternative course run on simpler lines for girls who feel they cannot cope with the considerable amount of study involved in the S R N course. This leads to the qualification of State Enrolled Nurse. The salary scale for the S E N is slightly lower than the one indicated above.

There are no fees incurred during training, and indeed, an allowance is made in addition to full board and lodging.

The qualified nurse has many interesting openings available to her. Apart from the different branches of hospital work, there are: District Nursing, Midwifery, Private Nursing, Public Health Nursing (all of which allow the nurse a more independent and less communal life), Industrial Nursing, the Nursing Services of the Crown, the Overseas Nursing Service, and the various Missionary Societies.

Male Nurses. These are nowadays quite often trained and employed under similar conditions. They work usually in the larger hospitals, and almost always live out (except in the case of Mental Hospitals). There are good prospects, particularly for Male Nurses, as "Sister Tutors," when both teaching and nursing qualifications are combined.

OCCUPATIONAL THERAPY.

B. G.

Age 18+

Qualifications O or A

Pay. Commences at £525

Aptitudes. Interest in people, initiative, tact, practical and/or artistic ability

Method of Entry. Acceptance for course by approved Training School

Further Training. Usually 3 years leading to the Diploma of the Association of Occupational Therapy.

The Occupational Therapist is concerned with helping the patient to recover and regain his self-confidence by guiding him into a suitable form of work, activity, or recreation. The therapy is therefore partly psychological and partly physical, and the therapist is the person who sees that the doctor's wishes in this respect are carried out and who can prescribe the necessary activities and encourage the patient to co-operate.

During training the student works for part of the time in a hospital learning how to become a member of the team concerned with the recovery of the patient. He or she also studies Anatomy, Physiology, Psychology, Medicine and Surgery, Psychiatry, and the Theory of Occupational Therapy, as well as a series of remedial techniques.

A list of the approved training schools can be had from the address below. Fees are payable, but maintenance and other grants are often available from the Local Education Authority, subject to the usual conditions.

Address

The Association of Occupational Therapists, 251 Brompton Road, S W.3.

Pamphlets.

Choice of Careers Series, No. 53 (H.M.S.O.), 6d.

Occupational Therapy Available from the Association.

OPTICIAN.

(1) Dispensing Optician.

B. G.

Age. 16+.

Qualification. O

Pay. £505–£840 in the Hospital Eye Service, more in private practice

Aptitudes. Neatness, manual dexterity, interest in people, attention to detail

Method of Entry. Acceptance by a CAT for full-time course or employment with a registered optician

Further Training. Two years' full-time college course or by working under an approved optician with part-time study (this takes about 4 years)

The dispensing optician is the person who dispenses the prescriptions of oculists and his work is concerned with the selection, measuring, fitting, checking and supply of spectacles and other optical appliances

(2) Ophthalmic Optician

B. G.

Age. 18+.

Qualification. A

Pay. £645–£985 (minimum scale in Health Service)

Aptitudes. Neatness, interest in people and in the medico-sciences, attention to detail

Method of Entry. Acceptance by a CAT for a full-time course

Further Training. 3 year training course followed by 1 year of practical work with a qualified optician

The ophthalmic optician is responsible for the examination of eyes and for the prescription of spectacles, contact lenses, etc He or she also dispenses these prescriptions During the twelve months' practical clinical experience which follows the full-time college course, the student may expect a salary of about £410. He or she can then join the National Health Service, either in the Hospital Eye Service or in private practice

The Optical Profession Available from the Association of Optical Practitioners.

ORTHOPTICS.

B. G.

Age. 17+.

Qualifications. O, but preferably A.

Pay. £525 to £630 (minimum scale).

Aptitudes. Patience, liking for people, especially children.

Method of Entry. Acceptance on a course at an approved hospital.

Further Training. 2 years' full-time training leading to the Diploma of the British Orthoptic Board.

The orthoptist is concerned with remedial work with patients (very often children) who suffer from squints and "lazy" eyes. She (for it is usually girls who take up this career) may work in an eye hospital, a children's hospital, a general hospital with an ophthalmic department, or a school clinic. There are also some opportunities with ophthalmic surgeons in private practice

Those who become interested in teaching may take a course after at least 2 years' experience in order to qualify. The teaching side commands rather higher salaries. There are fourteen Orthoptic Training Schools attached to hospitals throughout the country, and a list of these and full details can be obtained from the address below

Addresses

PERSONNEL MANAGEMENT. *See* Social Work

PHARMACY.

B. G.

Age. 18.

Qualifications. A.

Pay. Retail and industrial from £700 upwards. Hospital: £690–£1,010

Aptitudes. Interest in science, capacity for detail, normal colour vision

Method of Entry. Registration with the Pharmaceutical Society as a student and acceptance by a School of Pharmacy.

Further Training.

1. 3 years' full-time study for Pharmaceutical Chemist's Diploma, followed by 1 year's practical training in a pharmacy, a hospital, or a manufacturing laboratory
2. Degree in Pharmacy followed by 1 year's practical training as above

Pharmacy is the branch of medical work concerned with the dispensing of medicines and appliances There are three main branches of the profession, namely retail, hospital, and manufacturing The majority of vacancies occur on the *Retail* side, and the normal procedure is for the newly qualified person to secure employment as an assistant to an established pharmacist, with the intention of eventually taking a partnership, starting alone, or obtaining a managerial post in one of the large retail concerns *Hospital Pharmacy* work is growing in scope, but at the moment positions are rather hard to obtain as they are limited in number *Pharmaceutical Manufacturing* provides many openings, often with the opportunity for research and travel

It should be noted that there is nothing to stop a qualified young person gaining experience in more than one of these branches, as experience gained in one type of work is of undoubted value in the others.

Address.

The Pharmaceutical Society of Great Britain, 17 Bloomsbury Square, W C.1.

Pamphlet

Choice of Careers Series, No. 62 (H.M S O), 9d

PHOTOGRAPHY.

B. G.

Age. Usually 16.

Qualifications. Preferably O.

Pay.

1. In commercial work, about £400 p.a after training.
2. In National Health Service, about £440–£760 p a (Whitley Council Scale).

Aptitudes. Patience, neatness, artistic ability.

Method of Entry.
1. Apprenticeship.
2. Acceptance on full-time course at School of Photography
3. Securing of employment as junior assistant to photographer

Further Training.
1. 4-year apprenticeship, combined with part-time study for the exams of the Institute of British Photographers or for City and Guilds Certificate
2. 3 years' full-time study at Art School or School of Photography
3. As a junior assistant, part-time study for the examination of the Institute of British Photographers or the City and Guilds of London Institute

Photography as a career has many branches of which the following are the main ones Portraiture, Advertising, Press, Medical, Scientific

All these branches demand skilled work, not only in the taking of pictures but on the processing side Some, such as the Scientific or Press branches require special aptitudes or training Indeed, the amount of background knowledge of science needed to make a top rate Scientific Photographer is often of degree order

Those who choose to acquire their training by apprenticeship or while working as a junior assistant must guard against the danger of getting too one-sided a practical experience while training For an apprenticeship, this can generally be avoided by careful choice of a firm which deals with varied work, but it presents a real problem for the ordinary assistant attempting to study in his or her spare time Even for those who wish to follow full-time courses, there is considerable difficulty in finding vacancies, as there are too few schools for the number wishing to train Early application is therefore essential

A full list of the Colleges providing full-time courses can be obtained from the Institute at the address below

Address

The Institute of British Photographers, 38 Bedford Square, W C 1

Pamphlet

Choice of Careers Series, No 83 (H M S O), 1s 6d

PHYSICS. *See* Science

PHYSIOTHERAPY.

B G.

Age 18 +

Qualifications. O or A

Pay £525 p a starting salary when trained Possibility of rising to £1,055 p a

Aptitudes. Physical fitness, tact, liking for people

Method of Entry Acceptance for training by a school recognised by the Chartered Society of Physiotherapy

Further Training. 3 years' full-time training at a school as above, studying for the examinations of the Society

The physiotherapist is the person who assists the doctor to hasten the recovery of patients suffering from many types of injury or illness by using physical means Thus massage, electrotherapy, and exercises prescribed by a doctor all come within the scope of the physiotherapist It is obvious, therefore, that the trained person must be fully grounded in physiological matters, as well as the potentialities of the aids which are now available. It is because of the necessary thoroughness of training that the course lasts 3 years

Grants are available from the Ministry of Health

As is so often the case where work involving service to others is concerned, salaries are not particularly high, but the young man or woman who takes up physiotherapy as a career has at least the satisfaction of knowing that the work he or she is doing is of increasing social importance.

A detailed list of training establishments is available from the Society at the address below.

Address

The Chartered Society of Physiotherapy, Tavistock House, Tavistock Square, W C 1

Pamphlet

Physiotherapy, a career with a future Available from the Society

POLICE

B. G.

Age

Men, 19 30, Cadets 16-18
Women, 20 35 (20 30 in Scotland)

Qualifications. For Cadets usually O

Pay
1. Men, £635-£965 after nine years
2. Women, £570 £870 after nine years

(These are Constables' rates only and are somewhat higher in the London area)

Aptitudes. Good health, patience, team spirit, keen observation

Note There are certain physical requirements —

Men must be at least 5 ft 8 in tall (in some forces taller)
Women must be at least 5 ft 4 in tall
Sight must be normal without glasses

Method of Entry By application to the local Police Station or the Chief Constable or Senior Officer of the local Police Force.

Further Training 3 months' basic training, followed by practical training for about 2 years.

The fundamental purpose of the police is the maintenance of law and order, but there are many other ways in which they are of service to the community—from the relief of traffic congestion to the simple help and guidance of the general public

There are 125 Police Forces in England and Wales, and thirty-three in Scotland, and they vary greatly in size and make-up The largest and most complex are those in the large towns, and it is in these forces that the ambitious boy or girl will probably be most interested

Specialist police work is done by the following branches C I D , finger-prints and photography, motor patrol, wireless duties, river police work, registration of aliens These departments draw on the ordinary constabulary for their recruits, and young people with special aptitudes have a good chance of being selected

For the first 2 years new entrants are on probation, and during this time they have several courses and examinations Promotion thereafter to the ranks of Sergeant and Inspector is by service and examination subject to vacancies being available There is a contributory superannuation fund, and an officer may retire after 25 years' service on half the average pay of the last 3 years of service Welfare and sports facilities are usually very good One important thing to note is that the pay rates quoted (which are the minimum) do not show the " hidden income " of rent-free accommodation or allowance in lieu

Those boys who have definitely decided on the police as a career (or who wish to find out for themselves what it is all about), but who are not old enough to join, can join the Police Cadets attached to certain police forces.

Addresses.

The Police Recruiting Department, Home Office, Whitehall, S W 1

The Police Recruiting Department, Scottish Home Department, 18 Rothesay Terrace, Edinburgh, 3.

Your Career: Life in the Police Available from the Home Office.

PRINTING.

B.

Age. 15–16

Qualifications. It is said to be useful if the candidate has a relation in the firm which he wishes to join.

Pay. Basic minimum over £11 per week on completion of training Real wages often considerably higher

Aptitudes. Intelligence, good eyesight, neatness, attention to detail

Method of Entry. Acceptance of candidature for apprenticeship by Local Apprenticeship Committee

Further Training. 6 years' apprenticeship coupled with day part-time release and evening study at a Technical College

Printing is a skilled occupation, and the term covers the activities of compositors, machine managers, photo-process workers, stereotypers, electrotypers, etc It is also one of the most highly remunerated manual industries, and there is considerable competition for the available apprenticeships It is therefore helpful to have the agreement of a master printer to accept the would-be apprentice when applying to the Local Apprenticeship Committee.

Some schools also run full-time courses for those interested in the ancillary aspects of printing, such as costing, estimating, paper, and administration, as well as the practical operative work Such courses last from 2 to 3 years

Printing enjoys one of the highest degrees of security as an individual career, and does not suffer from the recessions which periodically hit other industries

Full details of this career can be obtained from the second address below

Addresses

PROBATION OFFICER. *See* SOCIAL WORK.

RADIOGRAPHY AND RADIOTHERAPY

B. G.

Age. 18.

Qualifications. At least O.

Pay. £525 to about £1,000 p.a., depending on experience and status.

Aptitudes. Interest in people, tact, scientific outlook

Method of Entry. Acceptance by training hospital recognised by Society of Radiographers

Further Training. 2 years' full-time study at a training hospital leading to the Diploma Examination of the Society of Radiographers Grants are available from the Ministry of Health

Radiography is the taking of X-ray photographs, and Radiotherapy is the treatment of disease by X-ray and radium techniques The training for both branches is the same during the first year, but thereafter those who are going in for Radiotherapy follow a different course The radiographer is a member of one of the important teams of doctors, nurses, therapists, and almoners who are essential to the efficient running of the hospital service At the moment the majority of workers in Radiography and Radiotherapy are women, but there is no reason why young men with an interest in this type of work should not make a satisfying career, especially as radiography services are expanding

A list of the hospitals offering courses can be obtained from the Society at the address below

Address.

SCIENCE.

B. G

Age. 16, 18 or 21.

Qualifications O, preferably A or degree in appropriate sciences including maths

Pay Newly qualified graduate scientist £600-£700, after 20 years, somewhere between £1,500 £2 500, or more

Aptitudes. Imagination, enthusiasm, capacity for original thought, integrity, practical ability, desire to work with a team, patience, perseverance

Methods of Entry. Either through a University, a College of Technology, or a post in a laboratory

Further Training. In view of the increasing complexity of all the sciences it is important to continue with full-time study as long as possible, preferably to A level G C E or beyond to a degree or Dip Tech or to Graduate membership of a professional institute Those who attempt to qualify by evening classes or even on a day release course nowadays, seldom go as far as was originally hoped

As mathematics is the universal language of science, reasonable ability in this subject is essential The basic natural sciences are physics, chemistry, and biology All scientists need to be trained in scientific method to observe accurately and to consider objectively Scientists may be employed in research, in the development of ideas, in production and the management of productive plant, in testing, analysis and control, in technical services, sales information, in lecturing at Universities and Colleges of Technology and in teaching in schools

SECRETARIAL WORK AND OFFICE MANAGEMENT

B. G.

Age. 15, only rarely now, usually 16 or 18.

Pay. Varies widely, £6 to £8 per week to start

Aptitudes. Tact, discretion, a good memory, facility with words and figures

Method of Entry By application for advertised posts or through the Youth Employment Service or an employment agency

Further Training. If not qualified before entry, for shorthand typing and/or National Certificates or Diplomas in Business Studies Also for professional qualifications

(1) Office work generally Owing to the increasing use of all kinds of office and computing machines, office work is changing very rapidly, *e g*, the proportion of girls using shorthand is decreasing, particularly in large offices, where the use of audio typing and machines requiring figure work is increasing rapidly

(2) Secretaries are required mainly as personal assistants to management and so offer an interesting and well-paid career for the well educated reliable, and intelligent girl, especially if she has good personal qualities Training is usually by a full-time course at a private secretarial school or a Technical or Commercial College, after O, A, or a degree has been obtained Women graduates (often with language qualifications) who take a secretarial course can look forward to very interesting careers, often involving travel and increasing responsibility as they gain experience

(3) Management, *i e*, supervision control and organisation of staff, sales and marketing, buying, accountancy and finance, insurance and transport, planning and production Training usually combines practical experience with study for appropriate qualifications

Information about Accountancy, Actuarial work, Advertising Banking, Insurance, Law, and Laundry work will be found elsewhere in this section Other professional organisations which offer examinations leading to suitable qualifications are -

SOCIAL WORK.

B. G.

Age of Entry. 21 +, more usually 22 + or after experience in paid employment

Qualifications. Degree or Diploma in Social Studies or Degree followed by post graduate training

Aptitudes. Tact, patience, interest in people and in social conditions, emotional stability, a sense of vocation, persistence in arduous and sometimes discouraging work.

Method of Entry. Acceptance for specialised training, *i e*, appointment with Central or Local Government Authority or with a voluntary organisation.

Further Study. Specialised training for the chosen branch, and for membership of professional organisation

Different branches of social work touch almost every aspect of life Some are concerned with problems of work, recreation or accommodation, while others cater for special classes of persons with particular needs, *e g*, deprived children Others help people who have special difficulties with their relations with others or who suffer from physical or mental illness There are also social workers who deal with groups of people to prevent them getting in trouble or into emotional difficulties

Social workers are trained to do case work with individuals but some work with people who may not have individual problems and so work with groups in clubs and centres

SPEECH THERAPY.

B G.

Age. 18.

Qualifications. A.

Pay. £525–£965 p a.

Aptitudes. Self-confidence, ability to speak clearly and well, liking for people, tact

Method of Entry. Acceptance by approved training school.

Further Training. 3 years' full-time training for the Diploma of the College of Speech Therapists.

Speech Therapists are usually girls, but there is no reason why boys who are interested in people and who satisfy the other preliminary requirements should not make a rewarding career in speech therapy, even though the financial return is unexciting.

The work involves the remedial treatment of speech defects, especially in children, at school, clinics, and in hospitals There is also a considerable amount of part-time work available, payment for which is on a sessional basis

One can practise only if one is a Licentiate of the College of Speech Therapists, and there are seven training schools recognised by this body, namely.—

1 The Central School of Speech Training and Dramatic Art, The Embassy Theatre, Swiss Cottage, N W 3

2 The Kingdom-Ward School of Speech Therapy, 26 Lower Sloane Street, S W 1

3 The Speech Therapy Training School of the West End Hospital for Nervous Diseases, 26 Holland Park, W 11.

4 The Oldrey Fleming School of Speech Therapy, 16 Harley Street, W 1

5 The Leicester School of Speech Therapy Adult Education Centre, Pelham House, 100 Welford Road, Leicester.

6 The Edinburgh School of Speech Therapy, 7 Buccleuch Place, Edinburgh, 8

7. The Glasgow School of Speech Therapy, 25 Athole Gardens, Glasgow, W 2

Address

The College of Speech Therapists, 68 Queen's Gardens, W.2.

Pamphlets.

Choice of Careers Series, No 51 (H M S O), 6*d*

Speech Therapy as a Career Available from the College.

SURVEYING.

B. G.

Age. 16+

Qualifications. O, but preferably A

Pay. Depending on branch, but roughly in region of £600–£1,300 p a on qualification

Aptitudes. Capacity for detail, methodical mind, ability to calculate quickly and accurately.

Method of Entry In general —

1. As a junior assistant or under articles in an approved Surveyor's office
2. Acceptance by approved training school for full-time course
3. As a graduate holding B A, or B Sc (Estate Management)

Further Training.

1. If entering as junior assistant or under articles. at least 4 years' part-time study leading to the Final Examination of the Royal Institution of Chartered Surveyors
2. Full-time study for the First and Intermediate examinations of the Royal Institute, followed by 2 years' practical work and then the Final Examination
3. If entering as a graduate, 2 years' practical work

All the above methods lead to membership of the Royal Institute.

Surveying is a profession with many specialised aspects The various branches are Building Surveying, Housing Management, Land Agency, Land and Hydrographic Surveying, Mining Surveying, Quantity Surveying, Town and Country Planning, Valuation

Building Surveying is concerned with the supervision of building, building repairs, and the specifications for builders' work of all descriptions

Housing Management is more specifically the development and management of housing estates

Land Agency involves the management of country estates and agricultural improvements valuations

Land and Hydrographic Surveying is concerned with measuring and drawing the shape of the land, and mapping the rivers, lakes, and seas Surveyors in this category are usually government servants.

Mining Surveying is concerned with underground surveys and preparing plans for workings Surveyors are usually employed by the National Coal Board, but have great scope for work overseas.

Quantity Surveying is concerned with drawing up the estimates of materials and labour required in accordance with the architect's plans The Quantity Surveyor is also concerned with the valuation of work executed

Town and Country Planning deals with the preparation and development of planning schemes and involves the surveying of resources and needs of a particular area Further study to gain the Diploma of the Town Planning Institute is advisable for this branch of the career

Valuation The Valuation Surveyor either works for the Inland Revenue and is employed to value real property for the Crown in connection with death duties, income tax, etc , or is in private practice and carries on similar work on behalf of private individuals

The newcomer to this profession will have decided which branch of surveying he or she wishes to take up Except for Mining and Land Surveying, all branches have a common syllabus for the First Examination of the Royal Institution of Chartered Surveyors, but thereafter the Intermediate and Final Examinations are on work appropriate to the specialisation being followed The requirements of the other professional bodies vary in detail, and full information may be had from the addresses below

There is at present a shortage of qualified surveyors in the country, partly because many surveyors obtain lucrative employment overseas, and the prospects for energetic ambitious young people are excellent

TEACHING (England and Wales).

B G.

Age. 18+

Qualifications. O, usually A

Pay. Depending on qualifications, status, and experience, basic scale approx. £600 to £1200 with additions for qualifications and training.

Aptitudes. Patience, interest in the young, sense of humour, good health

Method of Entry (State system)

1. Acceptance by Training College
2. As a graduate followed usually but not necessarily by acceptance by University Department of Education

Note At the moment it is not essential for a graduate (or person holding certain other qualifications in, *e g*, art, music) to hold a Diploma in Education of a University Department of Education, but in a few years' time this may be essential for new entrants

Further Training.

1. If accepted by Training College, 3 years' full-time training This can sometimes be combined with study for an external Degree (General or unclassified Honours)
2. The Diploma in Education course offered by University departments of Education, which lasts for 1 year

The majority of posts in teaching are available in schools run by the Local Education Authorities or assisted by them These fall into three main categories Primary, Secondary, and Further Education

The Primary System is made up mainly of Infant Schools (5–7 years) and Junior Schools (7–11) Teaching in Infants' and Junior Schools demands special qualities of patience and understanding, and it is usual for the Training College student to follow a slightly different programme of studies from those who are going to specialise in Secondary Teaching

The Secondary System is being constantly modified by many Local Education Authorities but basically there are two distinct patterns (i) The Secondary Modern/Secondary Technical/Secondary Grammar organisation, and (ii) The Comprehensive System

In the first of these children are sorted out at the age of 11 (or 13) according to their parents' wishes and their educational possibilities Those who go to Grammar Schools need a more specialised and academic course, and it is to this type of school that most graduates are attracted There are nevertheless many Modern Schools (which outnumber the Grammar by 4 or 5 to 1) offering courses leading to "O" and thus giving opportunities to graduates Technical Schools (which sometimes recruit their children at 13+) offer as well opportunities to people qualified in industry and commerce who wish to enter the teaching profession

The Comprehensive School aims at offering the facilities of the above three types under one roof, and is usually a large organisation affording opportunities to many different types of teacher

The Further Education system comprises the CATs, the Technical Colleges, The Colleges of Further Education Village Institutes, Evening Institutes, and is of interest to those who feel more drawn to work with young people and adults Much of the very varied field of work in Further Education is done by part-time teachers and lecturers, but there are nevertheless many opportunities for full-time teaching.

Salaries and conditions of service are gradually improving in the teaching profession, and it is now an attractive career (especially for women with the advent of equal pay) There are still many vacancies in all types of schools, and especially for qualified teachers of science and mathematics

There is a need for teachers of mentally and physically handicapped children

The independent schools are more and more coming into line with the State schools as regards salary, etc, and often are able to offer added inducements, such as free or cheap accommodation

There are no fees for courses at the Training Colleges, and help with maintenance is available for those who need it.

The educational system and methods of teacher training are different in Scotland and Northern Ireland, and details can be obtained from the appropriate addresses below

Career in Education for Graduates

Ministry of Education List No 172 (List of Training Colleges)

The above available from the Ministry

VETERINARY WORK

B. G.

Age 18+

Qualifications. A (to start University course)

Pay

1. In private practice as assistant, about £1000 to commence
2. In Government Service, from £900

Aptitudes. Patience, capacity for detailed observation, fondness of animals

Method of Entry Acceptance on University course

Further Training. 4–6 years' University Degree course

Veterinary work is concerned with the maintenance of good health in animals and the cure of animal diseases—in other words, the "vet" is the animal doctor The vet suffers from this disadvantage, however—that animals cannot speak about their symptoms The young man or woman contemplating veterinary work as a career must, therefore, have a real understanding of and love for animals This is what makes veterinary work a vocation rather than a career for many people

In order to practise as a "vet" one must be a member of the Royal College of Veterinary Surgeons, and the necessary qualification for this is a University Veterinary Degree Degree courses are offered by the following bodies —

Royal Veterinary College and Hospital, Camden Town, N W 1

Royal (Dick) School of Veterinary Studies, Summerhall, University of Edinburgh, 9

University of Glasgow Veterinary School

Veterinary Schools of the Universities of Bristol, Cambridge, Liverpool

Veterinary College of Ireland, Ballsbridge, Dublin, S E 4

For the qualified person, openings are available with the Ministry of Agriculture, Fisheries, and Food and for men in the Army (where after 1 year's service one reaches the rank of Captain). The majority of newly qualified people take a post as an assistant to an established vet in order to gain the necessary practical experience

Address

The Royal College of Veterinary Surgeons, 9–10 Red Lion Square, W C 1.

The World of Science

This section deals with everything from atoms to stars, from the simplest living things to the human mind in all its complexity. What could be more important or exciting?

TABLE OF CONTENTS

The World of Science

INTRODUCTION

At no time in our history has it been more necessary for the ordinary individual—and outside our own specialised knowledge we are all ordinary individuals—to know and understand what the scientists are doing, for we have now reached a state of affairs which may well prove to be the cross-roads of human destiny. The dramatic new developments have made it inevitable that all must live or all must die. On the one hand, there exists the possibility of undreamed-of abundance, peace, and happiness for an ever-increasing number of mankind, and on the other total annihilation, if not of the whole human species, at least of all that makes life worthwhile. Which way are we to choose?

In this choice ordinary people must play a major part, but this they cannot do without understanding the issues involved, since free choice must be based upon a certain minimum of knowledge, and this is the reason why *Pears Cyclopaedia* decided to include a section dealing with scientific progress.

The section is divided into two parts, the first (I., II., and III.) setting out to give a very brief account of the universe as seen by modern science and forming a background to the second part (IV.), which will discuss some of the more recent developments and discoveries. It need hardly be said that such a section must be sketchy in the extreme, and that only a very few of the main issues can be discussed. But the writer of this section believes with the Editor that it is worth while trying. We are frequently reminded by the learned that modern knowledge increases so rapidly that no single mind can come anywhere near achieving the sort of universal knowledge which was possible, say, in the eighteenth century—and obviously this is quite true. But all this vast body of knowledge is not essential to most of us, who ask only two things from science: (1) that it should give us a *general* picture of the universe which will give us some idea of where we stand in relation to it; (2) that it should give us *particular* information concerning practical issues which concern us in everyday life. To describe modern knowledge from this point of view is certainly possible, although whether the present attempt succeeds in doing so the reader must decide for himself.

I. THE STRUCTURE AND ORIGIN OF THE UNIVERSE

The universe includes everything from the smallest sub-atomic particle to the mightiest system of stars. The scientific view of the universe (not the only view but the one we are concerned with here) is a remarkable achievement of the human mind, and it is worth considering at the outset what a "scientific view" is, and what is remarkable about it.

A scientific view of something is always an intimate mixture of theories and observed facts, and not an inert mixture but a seething and growing one. The theories are broad general ideas together with arguments based on them. The arguments are designed to show that, if the general ideas are accepted, then this, that, or the other thing ought to be observed. If this, that, or the other actually are observed, then the theory is a good one; if not, then the theoreticians have to think again. Thus theoretical ideas and arguments are continually subjected to the severe test of comparison with the facts, and scientists are proud of the rigour with which this is done. On the other hand, theories often suggest new things to look for, *i.e.*, theories lead to predictions. These predictions are frequently successful, and scientists are entitled to be proud of that too. But it follows that no theory is immutable; any scientific view of any subject may, in principle, be invalidated at any time by the discovery of new facts, though some theories are so soundly based that overthrow does not seem imminent.

A remarkable aspect of the scientific view of the universe is that same principles are supposed to operate throughout the whole vastness of space. Thus the matter and radiation in stars are not different from the matter and radiation on earth, and their laws of behaviour are the same. Therefore theories hard won by studies in terrestrial physics and chemistry laboratories are applied at once to the whole cosmos. Astronomy and cosmology are spectacular extensions of ordinary mechanics and physics.

LOOKING AT THE UNIVERSE.

The universe is observable because signals from it reach us and some manage to penetrate our atmosphere.

First, there are waves of visible light together with invisible rays of somewhat longer (infra-red) and somewhat shorter (ultra-violet) wavelengths. These waves show us the bright astronomical objects and, to make use of them, astronomers have constructed telescopes of great power and precision backed up with cameras, spectroscopes, and numerous auxiliaries. The most powerful telescope, at Mt. Palomar, California, has a 200-in.-diameter mirror. The next major advance in optical telescope performance probably awaits the erection of telescopes on satellites outside the earth's atmosphere, which at present acts as a distorting and only partially transparent curtain.

Secondly, there are radio waves of much longer wavelength than light. These can be detected by sensitive radio receivers with special aerial systems. These are the radio telescopes (*See* **Part IV. Radio Astronomy**.) The most well known is at Jodrell Bank and started working in 1957.

A third type of radiation from outer space impinges on the atmosphere. This is the cosmic radiation. It consists of very fast-moving fundamental particles, including protons (**F14**). Cosmic rays are detected by Geiger counters, by the minute tracks they leave on photographic plates, and by other means. The origin of cosmic rays is still uncertain, but many people think they must have an intimate connection with the nature and evolution of the universe itself.

By looking at, and listening to, the universe with optical and radio telescopes, astronomers have formed a remarkably detailed picture of its structure. The merest outline of this will now be given.

Great Distances and Large Numbers.—Let us start with nearby objects. This raises at once the question of what "nearness" and "distance" are in astronomy and how they are to be expressed. A convenient unit of distance is the *light-year*, *i.e.*, the distance that light, travelling at 186,000 miles per second, traverses in one year. Since vast numbers as well as vast distances will enter the question, we need a shorthand for large numbers. Ten times ten times ten will be represented by 10^3, six tens multiplied together (*i.e.*, one million) will be written 10^6, and so on. 10^{14} would mean a hundred million million. One divided by a million (*i.e.*, one-millionth) will be written 10^{-6},

the very small number obtained by dividing one by the product of fourteen tens will be written 10^{-14}. A light-year is $5{\cdot}88 \times 10^{12}$ miles, the radius of an atom is about 10^{-8} cm.

The Solar System.—The earth is the third, counting outwards, of nine planets revolving in nearly circular orbits round the sun. Their names and some other particulars are given in the table (**F7**). The sun and its planets are the main bodies of the solar system. Between Mars and Jupiter revolve numerous chunks of rock called the asteroids, the largest of these, Ceres, is 480 miles across. Apart from these, the solar system is tenuously populated with gas, dust, and small particles of stone and iron. Dust continuously settles on the earth, and frequently small fragments enter the atmosphere, glow and evaporate; these are meteors or shooting stars. Sometimes larger rocks, called meteorites, hit the earth. Comets are relatively compact swarms of particles—containing ice according to one theory—which travel in elongated orbits round the sun. Their spectacular tails form under the sun's influence when they approach it. Not all comets stay indefinitely in the solar system; some visit us and go off into space for ever.

The sun itself is a dense, roughly spherical mass of glowing matter, 865,000 miles across. Its heat is so intense that the atoms are split into separated electrons and nuclei (*see* **F10**) and matter in such a state is called plasma. At the sun's centre the temperature has the unimaginable value of about 13 million degrees Centigrade (a coal fire is about 800° C). Under such conditions the atomic nuclei frequently collide with one another at great speeds and reactions occur between them. The sun consists largely of hydrogen and, in the very hot plasma, the nuclei of hydrogen atoms interact by a series of reactions whose net result is to turn hydrogen into helium. This is a process which releases energy just as burning does, only these nuclear processes are incomparably more energetic than ordinary burning. In fact, the energy released is great enough to be the source of all the light and heat which the sun has been pouring into space for thousands of millions of years.

We may note in passing that the occurrence of these energy producing reactions in sufficiently hot plasmas is the reason why so much effort is nowadays put into the study of plasma physics. There are many experiments being made to produce and contain hot plasma. They are man's attempts to imitate on earth the energy-giving processes in the sun.

Stars.—In colour, brightness, age, and size the sun is typical of vast numbers of other stars. Only from the human point of view is there anything special about the sun—it is near enough to give us life. Even the possession of a system of revolving planets is not, according to some modern views, very unusual.

No star can radiate energy at the rate the sun does without undergoing internal changes in the course of time. Consequently stars evolve and old processes in them give rise to new. The exact nature of stellar evolution—so far as it is at present understood—would be too complex to describe here in any detail. It involves expansion and contraction, changes of temperature, changes of colour, and changes in chemical composition as the nuclear processes gradually generate new chemical elements by reactions such as the conversion of hydrogen to helium, helium to neon, neon to magnesium, and so on. The speed of evolution changes from time to time, but is in any case very slow compared with the pace of terrestrial life; nothing very dramatic may occur for hundreds of millions of years. Evidence for the various phases of evolution is therefore obtained by studying many stars, each at a different stage of its life. Thus astronomers recognise many types with charmingly descriptive names, such as blue giants, sub-giants, red and white dwarfs, supergiants.

The path of stellar evolution may be marked by various explosive events. One of these, which occurs in sufficiently large stars, is an enormous explosion in which a substantial amount of the star is blown away into space in the form of high-speed streams of gas. For about a fortnight, such an exploding star will radiate energy 200 million times as fast as the sun. Japanese and Chinese (but not Western) astronomers recorded such an occurrence in A.D. 1054, and the exploding gases, now called the Crab nebula, can still be seen in powerful telescopes and form a cloud six or seven light-years across. While it lasts, the explosion shows up as an abnormally bright star and is called a *supernova*.

Groups of Stars.—It is not surprising that ancient peoples saw pictures in the sky. The constellations, however, are not physically connected groups of stars but just happen to be patterns visible from earth. A conspicuous exception to this is the Milky Way, which a telescope resolves into many millions of separate stars. If we could view the Milky Way from a vast distance and see it as a whole we should observe a rather flat wheel of stars with spiral arms something like the sparks of a rotating Catherine wheel. This system of stars is physically connected by gravitational forces and moves through space as a whole; it is called a *galaxy*.

The galaxy is about 10^5 light-years across and contains roughly 10^{11} stars. An inconspicuous one of these stars near the edge of the wheel is our sun; the prominent stars in our night sky are members of the galaxy that happen to be rather near us. Sirius, the brightest, is only 8·6 light-years away, a trivial distance, astronomically speaking.

The galaxy does not contain stars only, there are also clouds of gas and dust, particularly in the plane of the galaxy. Much of the gas is hydrogen and its detection is difficult. However, gaseous hydrogen gives out radio waves with a wavelength of 21 cm. Radio telescopes are just the instruments to receive these, and workers in Holland, America, and Australia detected the gas clouds by this means. In 1952 they found that the hydrogen clouds lie in the spiral arms of the galaxy, and this is some of the strongest evidence for the spiral form.

Around the spiral arms, and forming part of the galaxy, are numerous globular clusters of stars. These are roughly spherical, abnormally densely packed, collections of stars with many thousands of members. Because of its form and density, a globular cluster may be assumed to have been formed in one process, not star by star. Thus all its stars are the same age. This is of great interest to astronomers, because they can study differences between stars of similar age but different sizes.

Galaxies.—One might be forgiven for assuming that such a vast system as the galaxy is in fact the universe, but this is not so. In the constellation of Andromeda is a famous object which, on close examination, turns out to be another galaxy of size and structure similar to our own. Its distance is given in the table (**F7**). The Milky Way, the Andromeda Nebula, and a few other smaller galaxies form a cluster of galaxies called the Local Group. Obviously it would not be so named except to distinguish it from other distinct groups, and it is indeed a fact that the universe is populated with *groups*, or *clusters*, of *galaxies*. A cluster may contain two or three galaxies, but some contain thousands. So far as the eye of the telescope and camera can see, there are clusters of galaxies.

On a photograph a galaxy is a nebulous blob without the hard outline that a single star produces. Such nebulæ were formerly thought to be inside the Milky Way, but, after controversy, it was established that many of them were separate distant galaxies. By about 1920 it was known that there were at least half a million galaxies, and with the advent of the 100-in. Mt. Wilson telescope this number rose to 10^8 and is being increased further by the 200-in. telescope which can see out to a distance of 7×10^9 light-years. Through the powerful telescopes the nearer galaxies reveal their inner structures. Photographs of galaxies are among the most beautiful and fascinating photographs ever taken, and readers who have never seen one should hasten to the nearest illustrated astronomy book. Among

the pictures are some showing pairs of remote galaxies in collision. Such occurrences are of particular interest because they appear to be very strong sources of radio waves detectable by radio telescopes

The Expanding Universe.—Two discoveries about galaxies are of the utmost importance One is that, by and large, clusters of galaxies are uniformly distributed through the universe The other is that the distant galaxies are receding from us.

How is this known? Many readers may be familiar with the Doppler effect first discovered in 1842. Suppose a stationary body emits waves of any kind and we measure their wavelength, finding it to be L ins Now suppose the body approaches us; the waves are thereby crowded together in the intervening space and the wavelength appears less than L, if the body recedes the wavelength appears greater than L The Austrian physicist, J Doppler (1803–53), discovered this behaviour in sound waves, and it explains the well-known change of pitch of a train whistle as it approaches and passes us The same principle applies to the light Every atom emits light of definite wavelengths which appear in a spectroscope as a series of coloured lines—a different series for each atom. If the atom is in a receding body all the lines have slightly longer wavelengths than usual, and the amount of the change depends uniquely on the speed Longer wavelengths mean that the light is redder than usual so that a light from a receding body shows what is called a "red shift" The speed of recession can be calculated from the amount of red shift

It was the American astronomer, V M Slipher, who first showed (in 1914) that some galaxies emitted light with a red shift In the 1920s and 1930s the famous astronomer E Hubble (1889-1953) measured both the distances and red shift of many galaxies and proved what is now known as Hubble's Law This states that the speed of recession of galaxies is proportional to their distance from us This does not apply to our neighbours in the Local Group, we and they are keeping together. Hubble's Law has been tested and found to hold for the farthest detectable galaxies, they are about 7×10^9 light-years away and are receding with a speed ⅔ of that of light

Does this mean that the Local Group is the centre of the universe and that everything else is rushing away from us? No, Hubble's Law would appear just the same from any other cluster of galaxies Imagine you are in a square on some fabulous chess board which is steadily doubling its size every hour, all other squares double their distances from you in an hour Therefore the farther squares from you must travel faster than the nearer ones, in fact, Hubble's Law must be obeyed But anyone standing in any other square would get the same impression

This extraordinary behaviour of the universe is one of the most exciting discoveries of science Let us envisage one possible implication If the galaxies have always been receding, then in the past they must have been closer together Following this to its conclusion, it seems that all the matter in the universe must have been packed densely together about 10^{10} years ago Was this really so? The lack of any definite answer to this question is one of the things that makes cosmology so interesting

THE ORIGIN OF THE UNIVERSE.

Errors of observation and interpretation occur of course But there are many checks and repetitions made, so that, on the whole, the descriptive account of the universe would be generally agreed among astronomers. When it comes to inventing theoretical explanations, however, science is on less sure ground, and indeed the theory of the universe is an arena of controversy at present In most other sciences experiments can be repeated and the same phenomena observed under differing but controlled conditions This is very helpful. But, by definition, there is only one universe, one cannot repeat it or do experiments with it. On the other hand, it must be remembered that the light from distant galaxies has taken perhaps 10^9 years to reach us, so it tells us what the galaxies were like that number of years ago Therefore we are not confined simply to describing the present state of the universe, by looking farther into space we are looking farther into the past as well How, then, does the state of the universe vary with time?

Evolutionary Theories.—One answer to this can be obtained from Einstein's general theory of relativity Some slight indication of what this theory is about is given on page **F15**, and its logical development is, of course, a matter for mathematical specialists It turns out that, if we assume that matter is distributed uniformly throughout space (as observation strongly suggests), then the solutions of Einstein's equations show how the state of the universe may vary with time Unfortunately there are many possible solutions corresponding to expanding, static, or contracting universes As we have already seen, the actual universe is expanding, therefore the static and contracting solutions can be ruled out There is still a multiplicity of expanding possibilities some correspond to indefinite expansion from an initially very dense state, others to expansion followed by contraction to a dense state followed by expansion and so on repeatedly, *i e*, a *pulsating* universe The "dense state" is presumably to be identified with the time when the receding galaxies were all concentrated near one another, possibly in some dense conglomeration of atoms This initial state is thought by some to be the origin of the universe, they would say it has been expanding and evolving ever since If the universe is pulsating, then sooner or later, gravitational attractions between galaxies will slow the observed recession down and turn it into a mutual approach and so back to the dense state A straightforward application of the mathematics makes this dense state *infinitely* dense, and presumably something must happen before this inconceivable situation arises For example, forces between atomic nuclei may play an important part and determine what the dense state (if any) is actually like

The Steady State Theory.—A rival theory has been advocated by Bondi, Gold, and Hoyle since 1948 They hold that the universe is not changing with time, there was no initial dense state and no pulsations, the universe always has been, and always will be, like it is now This does not mean that no local changes can be observed—this would clearly be contrary to the facts But it does mean that, on the large scale, the clusters of galaxies have a distribution which is uniform in space and unchanging in time If the numbers of clusters of galaxies in a large volume of space were counted every few thousand million years the answer would always be the same

At first sight this appears to contradict outright the observed expansion of the universe For if the galaxies are receding from one another how can the number in a given volume remain constant? The situation is saved by a bold proposal It is that matter, in the form of hydrogen atoms, is being *continuously created* throughout space. This gas accumulates in due course into new galaxies, so that as the old ones move apart the young ones appear to keep the numbers up The necessary amount of continuous creation can be calculated and is equivalent to the appearance of one atom in an average-sized room every 20 million years If this seems absurdly small, try calculating the rate of creation in tons per second in a sphere of radius 10^9 light-years

The rate of creation is, however, much too small to have affected any of the laws of ordinary physics The famous law of the conservation of matter ("matter can neither be created nor destroyed") is violated, but on such a small scale that physicists, it is said, should not complain. Nevertheless some do complain and see in this violation a strong point against this theory

An Electric Theory.—On page **F12** will be found the statement that an atom is electrically neutral. If this were not quite true, nothing in physics would be affected, provided that the lack of neutrality

was exceedingly slight Suppose the proton charge exceeded the electron charge by 1 part in 10^{18}, then the hydrogen atom would be slightly positive electrically, but this would be undetectable in everyday physics But cosmology is not everyday physics, and Lyttleton and Bondi have recently pointed out that just such a small charge per atom would be sufficient, *on a galactic scale*, to cause the mutual repulsion of different parts of the universe by normal electric repulsive forces which always exist between similarly charged bodies This leads to a new explanation of the expanding universe which is based on a theory, not of gravitation, but of electricity A valuable by-product of this view is that the electric fields caused in galaxies by the excess charge will, under suitable conditions, accelerate protons to very high velocities This is a possible origin of cosmic rays, which consist largely of high-speed protons A triumph of this theory would be the actual detection in the laboratory of the difference between the charges on electrons and protons.

New Evidence.—Very recently new evidence relevant to the two preceding theories has come to hand The electric theory has suffered a reverse in that several workers have failed to detect in the laboratory a net charge on gaseous atoms, even though their apparatus was sensitive enough to react to the small charge postulated by Bondi and Lyttleton The steady state theory has also suffered a set-back, for Prof Ryle and the Cambridge radiotelescope team have produced evidence to show that, at immense distances from the earth, the population density of strong radio sources appears greater than it is near at hand The immense distances are such that the galaxies concerned emitted the observed waves about 8,000 million years ago This means that the galaxies were more closely packed formerly than they are now—a proposition contrary to the steady state theory (see above) Both theories and the experiments are subtle and complex, and no one would be wise to jump to the conclusion that these theories have received knock-out blows

The Formation of Galaxies and Stars.—On any theory of the universe, some explanation has to be found for the existence of clusters of galaxies In all theories galaxies condense out from dispersed masses of gas, principally hydrogen

According to the evolutionary theory, the "initial dense state" consisted of very hot plasma in a state of overall expansion The expanding plasma was both cooling and swirling about The random swirling produces irregularities in the distribution of the hot gas—here it would be rather denser, there rather less dense If a sufficiently large mass of denser gas happened to occur, then the gravitational attraction between its own particles would hold it together and maintain its permanent identity, even though the rest of the gas continued to swirl and expand Such a large mass would gradually condense into fragments to become galaxies, the whole mass turning into a cluster of galaxies.

The steady state view is interestingly and significantly different, for, on this theory, galaxies have always been present, and the problem is one of finding how existing galaxies can generate new ones out of the hydrogen gas which is supposed to be continuously created everywhere Moreover, this was to be done at just the right rate to maintain the galactic population density constant —otherwise it would not be a *steady state* theory.

Inside galaxies there is an average density of the order of 10 or 20 hydrogen atoms per cubic inch; between galaxies, the density is 10^5 times less Consequently we can imagine the relatively dense galaxy attracting the surrounding gas towards it by gravitation If the galaxy were stationary the gas would presumably form an accretion to the galaxy But imagine the galaxy to be moving through inter-galactic space. Then the combined effect of gravitation and motion is to create a region of increased gas density in the wake of the galaxy This concentration in the wake becomes sufficiently large and dense to condense itself, by its own gravitational attraction, into a new galaxy. The offspring may either stay near the parent, forming an embryonic cluster of galaxies, or separate In either case the process is repetitive and leads to the required stability in the number of galactic clusters

Once a huge gas cloud becomes sufficiently condensed to be separately identifiable as a galaxy, further condensation goes on inside it. It is believed on theoretical grounds that it could not condense into one enormous star but must form many fragments which shrink separately into clusters of stars In these clusters many stars perhaps hundreds or thousands or even millions, are born at once A small cluster, visible to the naked eye, is the Pleiades The Orion nebula, visible as a hazy blob of glowing gas in the sword of Orion, is the scene of much star-forming activity at present

The Formation of the Chemical Elements.—A stable nucleus is one that lasts indefinitely because it is not radioactive There are 284 known kinds of stable atomic nuclei and little likelihood of any more being found These nuclei are the isotopes (*see* **F10**) of 83 different chemical elements, the other elements, including, for example, uranium and radium are always radioactive Some elements are rare, others abundant The most common ones on earth are oxygen, silicon aluminium, and iron However, the earth is rather atypical It is especially deficient in hydrogen because the gravitational attraction of our small planet was not strong enough to prevent this very light gas from escaping into space

It is possible to examine the chemical constituents of meteorites and to infer the composition of the sun and other stars from the spectrum of the light they emit By such means the conclusion has been reached that 93% of the atoms in our galaxy are hydrogen, 7% are helium, all the other elements together account for about one in a thousand atoms A glance at the Table of Elements on page **N30** will show that hydrogen and helium are two of the lightest elements, they are in fact the two simplest

According to the steady state theory, hydrogen atoms are constantly being created The evolutionary theory supposes that the dense initial state was a system of very hot protons and electrons, *i e*, split-up hydrogen atoms In either case, therefore, the problem is to explain how the heavier chemical elements appear in the universe at all It is here that a fascinating combination of astronomy and nuclear physics is required

We have already referred to the fact that the energy radiated from the sun originates in nuclear reactions which turn hydrogen into helium Why is energy given out? To answer this question we note that nuclei are made up of protons and neutrons (*see* **F10**) These particles attract one another strongly—that is why a nucleus holds together To separate the particles, energy would have to be supplied to overcome the attractive forces This amount of energy is called *binding energy* and is a definite quantity for every kind of nucleus Conversely, when the particles are brought together to form a nucleus the binding energy is *released* in the form of radiations and heat Different nuclei consist of different numbers of particles, therefore the relevant quantity to consider is the *binding energy per particle* Let us call this B Then if elements of *high* B are formed out of those of *low* B there is a *release* of energy

Now B is small (relatively) for light elements like lithium, helium, and carbon, it rises to a maximum for elements of middling atomic weight like iron, it falls again for really heavy elements like lead, bismuth, and uranium Consequently, energy is released by forming middleweight elements either by splitting up heavy nuclei ("nuclear fission") or by joining up light ones ("nuclear fusion")

It is the latter process, fusion, that is going on in stars. The fusion processes can be studied in physics laboratories by using large accelerating machines to hurl nuclei at one another to make them coalesce In stars the necessary high velocity of impact occurs because the plasma is so hot Gradually the hydrogen is turned into helium, and helium into heavier and heavier elements. This supplies the energy that the stars radiate and simultaneously generates the chemical elements

The very heavy elements present a problem. To form them from middleweight elements, energy has to be *supplied* Since there is plenty of energy inside a star, a certain small number of heavy nuclei will indeed form, but they will continually undergo fission again under the prevailing intense conditions How do they ever get away to form cool ordinary elements, like lead and bismuth, in the earth? One view links them with the highly explosive supernovæ, to which we have already referred (**F4** (2)) If the heavy elements occur in these stars the force of the explosion disperses them into cool outer space before they have time to undergo the fission that would otherwise have been their fate The heavy elements are thus seen as the dust and debris of stellar catastrophes This view is in line with the steady state theory, because supernovæ are always occurring and keeping up the supply of heavy elements. In the evolutionary theory some of the generation of elements is supposed to go on in the very early stages of the initial dense state and to continue in the stars that evolve in the fullness of time It cannot be claimed that the origin of the chemical elements is completely known, but we have said enough to show that there are plausible theories Time and more facts will choose between them

The Formation of the Planets.—Did the sun collect its family of planets one by one as a result of chance encounters in the depths of space? Or was the solar system formed all at once in some generative process? To this fundamental question at least there is a fairly definite answer The planetary orbits all lie in about the same plane and the planets all revolve the same way round the sun This could hardly have happened by chance, indeed, it provides almost conclusive evidence for the alternative view But what was the generative process?

Many ideas have been proposed, and the problem is very intricate One of the most famous theories was originally championed by Kant, the German philosopher (1755), and by Laplace, the French mathematician (1796) In essence, it was held that the solar system was originally a great cloud of diffuse gas, probably rotating Under its own gravitational attraction the cloud contracted and, in accordance with a well-established mechanical law, the contraction caused the rate of rotation to increase When the rate was sufficient, masses of matter were thrown off from the edge and later condensed into the planets Numerous serious objections have been raised, but the whole problem is so complex that it is unreasonable to say that any theory of this sort must be wrong On the contrary, recent work has reinstated to some extent the view that the sun and its planets formed in a stellar condensation, one feature of which was the pushing outwards from the central sun of a disc of matter which subsequently became the planets Such a process would be regarded as normal in stars, and not exceptional

On the other hand, the planets have been attributed to the effect of a passing star whose gravitational attraction drew out from the sun a jet of gaseous matter which condensed into the planets Such an encounter between stars is very rare and, on this theory, the formation of planets must be an outside chance This theory was first developed by Jeans, but is not widely held now

The connection between stellar and planetary theory is brought out again by the existence on the planets of the heavier chemical elements How did they get there? If it be true that heavy elements are hurled into space by exploding supernovæ (see above), then at least one such explosion must have mingled its products with the widespread interstellar hydrogen before the planets condensed At one time Hoyle put forward the view that the sun was once accompanied by another star (there are many such binary systems known to astronomers) and that the sun's partner exploded Some of the ejected gases, captured by the sun's gravitational attraction, later condensed into planets, while the remnant of the star recoiled from the explosion and got away into space This explanation was later modified in that the exploding star and the sun need not be a close pair but merely two of a cluster of stars formed at the same time

Before leaving this subject, where theories are more numerous than firm conclusions, one more question may be raised was the earth formed hot or cold? There are adherents to both opinions One side would say that the planets condensed from hot gases, became liquid, and subsequently cooled and solidified, at the surface if not throughout Others would say that dust, ice, and small particles formed in space first and subsequently accumulated into large bodies, whose temperature rose somewhat later on

With space exploration beginning in earnest, considerable future progress in understanding planetary formation can be anticipated, and subsequent editions of *Pears Cyclopædia* will attempt to keep up with the new developments without too much time lag (*See* **Part IV. Radio Astronomy,** *also* **Space Research**)

THE SOLAR SYSTEM.

Name	Distance from Sun (millions of miles)	Diameter (thousands of miles)	Average density (water = 1)	Number of Satellites
Sun	—	865	1·41	-
Mercury	36	3·1	3·73	0
Venus	67	7·6	5·21	0
Earth	93	7·9	5·52	1
Mars	142	4·2	3·94	2
Jupiter	484	85·0	1·34	12
Saturn	887	70·0	0·69	9
Uranus	1785	30·9	1·36	5
Neptune	2797	33·0	1·32	2
Pluto	3670	?	?	0

SOME ASTRONOMICAL DISTANCES.

(1 light-year = $5{\cdot}88 \times 10^{12}$ miles)

Object	Distance from Earth (light-years)	Velocity of recession (miles per second)	Object	Distance from Earth (light-years)	Velocity of recession (miles per second)
Sun	$1{\cdot}6 \times 10^{-5}$	—	Andromeda Galaxy	$1{\cdot}5 \times 10^{6}$	—

THE EARTH

Shape and Size.—The earth has the form of a slightly flattened sphere, the polar radius being 6,357 km (3,950·4 miles) and the equatorial radius 6,378 km. (3,963·5 miles) Its mass is 5·97 × 10^{27} gm. and its volume is 1·083 × 10^{27} c c , hence its average density is about 5·5 grams per cubic centimetre This is about twice the average density of the surface material, so it is inferred that there exists a large volume of high density material within the earth *See also* **F48.**

Structure.—From a study of the passage of earthquake waves through the earth and observations of such properties as magnetism, moment of inertia, temperature increase with depth, etc it is deduced that the earth has a structure consisting of a series of shells The central *core* has a radius of some 3,600 km (2,250 miles), it is probably in part liquid, and is almost certainly composed of an alloy of nickel and iron Separated from the core by a fairly sharp boundary is the *mantle*, this has a thickness of about 2,800 km (1,750 miles) and is solid. It is probably composed of silicates of iron and magnesium with some metallic iron in the inner region The outer 100 km (62·5 miles) is the *crust*, which is solid under ordinary conditions but which may partially liquefy during periods of igneous activity Under the continents it is possible to distinguish two layers in the crust. an upper, less dense one, probably granitic in character, known as the sial, and a lower, denser one, the sima, probably basaltic in character The sial appears to be absent under the Pacific Ocean and very thin or absent under the Atlantic and Indian Oceans The concept of the sial blocks "floating" in the sima provides an explanation for the observed vertical movements of continents and leads to the theory that they may have "drifted" to their present positions The junction between the sima and the mantle is quite sharp, the break being known as the Mohorovičić Discontinuity *See* **Mohole, Section L.**

Composition.—Direct observation of the crust is confined to the surface and mines or boreholes, the deepest of which reach only to about 5 miles From analyses of the crystal rocks, the abundance of the elements in the crust can be estimated The commonest is oxygen (46·6%), followed by silicon (27·7%), aluminium (8·13%) and iron (5%). The next four are calcium, sodium, potassium, and magnesium, ranging between 3·6 and 2%. These 8 elements total 97·57% of the whole crust Most of the other 84 elements are present in amounts to be measured in parts per million, *e g* , copper occurs to the extent of 45 p p m , tin, 3 p p m These are average proportions over the whole crust, to be workable as ores, concentrations need to be much higher—*e g* , both copper and tin ores have to contain a minimum of 1% metal to be economic Locating the rare occurrences of such concentrations is the job of the prospecting geologist Taking the earth as a whole, *i e* , core, mantle and crust, most authorities agree that the commonest element is iron, followed by oxygen, silicon, and magnesium in that order, after this, there is only partial agreement.

The Age of the Earth —It is possible to make an estimate of the age of the earth's crust by considering the rate at which radioactive elements break down into inert elements A number of methods are now available, the most important being those based on the study of the abundances of isotopes of lead and other elements From the data obtained, estimates can be made of the following points on the time scale Age of earth's crust about 5 3 × 10^9 years (as a planet the earth has existed for several thousand million years), life emerged about 2 × 10^9 years ago, first large-scale occurrence of fossils, 600 × 10^6 years ago Other points on the scale are given in the table on **F30** (10^9 = thousand million, 10^6 = million).

The Materials of the Earth's Crust.—Geologists recognise three main classes of rocks making up the crust—Igneous, Sedimentary, and Metamorphic Rocks are aggregates of minerals, which may be regarded as simpler, homogeneous compounds, in contrast to the complex, inhomogenous mixture which is a rock. The bases of rock classification are minerals present, shape and size of the individual grains, and the mode of origin of the material

Igneous rocks are usually regarded as having crystallised from a molten state, although certain types may have arisen in other ways, *e g* , by reaction between high-temperature fluids, of the right composition, and pre-existing rocks Typical igneous rocks are granite and basalt, granite is coarse-grained, intrusive into other rocks, and contains the minerals quartz, potash or soda felspar, and usually a mica Basalt is fine-grained, flows out as lava at the surface and contains the minerals augite, calcium felspar, and usually olivine Between these extreme types are some thousands of intermediates, but together granite and basalt constitute 90–95% of all igneous rocks seen at the surface.

Sedimentary rocks are derived from pre-existing rocks by the processes of weathering and erosion, followed by transport to the point of ultimate deposition of the material, which is then converted from unconsolidated sediment to rock by the process of lithifaction Typical sedimentary rocks are sandstone, limestone, and shale Sandstone consists of particles of quartz and occasional other minerals, whereas shales are compacted clays, which may become slate if compressed very strongly during mountain building Limestones may be chemical precipitates, but are commonly formed by the aggregation of skeletal material of animals Some other sedimentary types of interest are conglomerates—lithified pebble beds—and evaporites, such as rock salt and gypsum beds The bulk of the sedimentary rocks were formed under marine conditions

Metamorphic rocks are produced by the action of heat and/or pressure upon pre-existing rocks, producing considerable changes in mineralogy and texture. Rocks subjected to heat alone are termed hornfelses (marbles if the original rock was a limestone) Pressure alone may produce slates, but often pressure results in shearing forces which crush and break up rocks to a fine powder (subsequently lithified), known as mylonite Heat and pressure together produce the type of metamorphism known as regional, because it occurs over large areas (*e g* , the Scottish Highlands), where it can be seen to have been associated with mountain-building processes Typical rocks of this kind are schist and gneiss, the former is a foliated rock, usually with much mica, while the latter is a banded rock, with dark and light bands of quartz and/or felspar and mica and/or hornblende Some gneisses, called migmatites, were produced by the injection of granitic material along the foliation planes of schists

Mountain Building.—There is no general agreement among geologists about the origin of mountains, despite many years of argument It is a matter of observation that the great mountain ranges are built of sedimentary rocks—usually much metamorphosed in the deeper levels—and occur in relatively narrow belts of great length The idea has developed that long, narrow depressions known as *Geosynclines* develop in the crust, into which vast quantities of sediments are poured The floor is slowly depressed by the weight of material, and ultimately the two sides of the geosyncline move together, folding the sediments both upwards and downwards, producing the complex structures seen in such regions as the Alps and Himalayas. It has been suggested that convection currents in crust, core, or mantle may provide the forces required, but some geologists believe that the earth is contracting and causing the skin to "wrinkle" Another possibility is that the sial blocks move about in the sima, and the Alps, for example, were formed when Africa drove northwards towards Europe. It is suggested that radioactive heating of the sima layers may make them sufficiently mobile to allow movement to take place, and this seems to be an essential feature of most theories of mountain building.

Glaciation.—Within the last million years much of the northern part of the Northern Hemisphere was covered by ice sheets, now reduced to the Arctic ice-cap. This has profoundly modified the landscape, especially in mountainous regions such as the Alps, North Wales, and the Scottish Highlands. The ice, moving first as valley glaciers and later as sheets over wide areas, scraped off all loose surface material, which was then available to abrade the bare rocks to give the characteristic scenery. In Britain the maximum advance of the ice-sheets brought them to the line Bristol Channel–Thames Estuary, passing just north of London. The great heaps of débris transported by the glaciers are known as moraines. The cause of the ice age is not fully understood, but it is worth noting that in the Permo-Carboniferous period in the Southern Hemisphere there was a widespread glaciation at the same time as the coal measures and desert sediments were being laid down in the Northern Hemisphere. Other glaciations are known from several other epochs as far back as 2×10^9 years.

The Oceans.—The oceans cover 75% of the earth's surface. They may be divided into three main types of environment—the *shelf seas*, bordering the continents, the *continental slopes*, transitional between the shelves and the *abyssal region*. Each region has its own type of sedimentation, fauna, and flora. Because of the virtual absence of a sial layer under the oceans, the study of the ocean floor yields special information about the sima and mantle, and may provide data leading to a solution of current problems relating to geosynclines and mountain building. Study of sedimentation in the oceans is important for understanding the ancient sedimentary rocks.

The Atmosphere.—The atmosphere at sea-level contains about 78·1% nitrogen and 21% oxygen, the remainder being carbon dioxide (0·03%) and the inert gases. It is thought that in the early stages of the earth's history much more carbon dioxide existed and less oxygen. When plants developed, the carbon dioxide was utilised in the building up of food substances with the release of oxygen in the process of photosynthesis (F29)

The International Geophysical Year, 1957–58.—The results of the IGY observations are still being analysed and discussed in order to exhaust their scientific content. It is certain that almost all the principal investigations in geophysics during the next half century and almost all the advances in our knowledge of the earth and of the forces acting upon it will be based upon the global data accumulated during the IGY. The oceans of the world have been so incompletely studied and present so many problems, many of which could not be investigated during the IGY, that further observations are to continue over a period of years, and a comprehensive programme of observations in the marine sciences has been planned.

THE WORLD OF PHYSICS

Anyone compelled by curiosity or professional interest to look into contemporary journals of pure physics research is soon struck by the fact that the old text-book division of physics into "heat, light, sound, electricity, and magnetism" has become very blurred. The indispensable periodical of research summaries, *Physics Abstracts*, contains about 450 entries a month, under forty separate headings. This is very daunting even to the experienced physicist and, as a token of the human effort devoted to one single branch of science, it is impressive for variety, for degree of specialisation, and for sheer volume. How can the main features of this great work be presented to the non-specialist?

Two different, though complementary, sections can be distinguished. First, there is the physics concerned with the properties of matter in bulk, with solids, liquids, and gases, and with those odd but very important substances, such as paints, plastic solutions, and jelly-like material, which are neither properly solid nor liquid. In this vast domain of physics questions like this are asked: Why is iron magnetic, copper not? What happens when solids melt? Why do some liquids flow more easily than others? Why do some things conduct electricity well, others badly, some not at all? During the last century, particularly the last few decades, it has become clear that such questions can be answered only by raising and solving others first. In particular, we must ask (i) Of what nature are the invisible particles of which matter is composed? and (ii) How are those particles arranged in bulk matter?

The first of these two questions has generated the second major category of modern physics: this is the physics of particles and of the forces that particles exert on each other. In this field, which represents science at its most fundamental, questions like this are asked. If matter is composed of small units or particles, what are they like? How many kinds of particle are there? Do the particles possess mass? electric charge? magnetism? How do the particles influence each other? How can their motion be described and predicted?

Once scientists became convinced that matter did indeed consist of particles, the *arrangement* of the particles in matter became an important question. This is the problem of *structure*. It was discovered, by von Laue in Germany and by W. H. and W. L. Bragg in England, that the structure of solids could be inferred from the way X-rays are reflected. It is well known that X-rays can penetrate solids. In doing so, they encounter successive layers of particles and are reflected from them. The reflections reveal how far apart the layers are and how the particles are arranged in space. This is the technique of X-ray crystallography. By now it has shown that most solid matter is *crystalline*, *i.e.*, it consists of a regular pattern of particles repeated over and over again to fill the volume of the solid—just as a wallpaper is covered by repeated units of design. The units in a crystal are very small, often about 10^{-8} cm across, and the particles in them are very close together.

Liquids, on the other hand, have no repeated pattern, but consist of particles which are jumbled up, though still very closely packed—like marbles in a bag. In gases, the particles are widely separated and moving rapidly about, the average distance between particles in air is about 10 times that in ordinary solids, and air particles have an average speed of 5×10^4 cm. per sec. (1,000 m.p.h.)

In general, therefore, the structure of matter is fairly well understood. This does not mean that structure studies are out of date, but only that now they are devoted to elucidating the structure of particular substances, often extremely complex ones such as are found in living matter. We shall therefore say no more about structure, but turn to the major divisions of physics introduced above: (i) particles and their forces; (ii) the properties of matter in bulk.

I. PARTICLES AND FORCES

The idea that matter is composed of small particles, or atoms, originated, it is true, in classical times. Nevertheless, the modern views need be traced back no farther than the beginning of the nineteenth century, when Dalton and his contemporaries were studying the laws of chemical combination. By that time the distinctions between elements, compounds, and mixtures were already made. Compounds and mixtures are substances which can be separated into smaller amounts of chemically distinguishable constituents. Elements (*see* N30) cannot be so divided. In a mixture the components may be mixed in any proportion and sorted out again by non-chemical means. In a compound the elements are combined in fixed proportions by weight. This last fact gives the clue to atomic theory.

Dalton and atomic theory.

Dalton pointed out that the fixed combining weights of elements could easily be explained if

the elements consisted of atoms which combined in simple numerical ratios, *e g*, 1 atom of element A with one of B, or one of B with two of C, and so on. For instance, 35 5 gm of chlorine combine with 23 0 gm. of sodium to make 58 5 gm. of ordinary salt. If we assume one atom of chlorine links with one of sodium, then the atoms themselves must have weights in the ratio 35 5 to 23 0. This turns out to be consistent with the combining weights of chlorine and sodium in all other compounds in which they both take part. Sometimes two elements combine in several different proportions by weight. But this is easily explained by assuming that the atoms link up in different numbers, *e g*, one iron atom with one oxygen, or two irons with three oxygens, or three irons with four oxygens. Then the three different combining proportions arise from the three different numbers of atoms, *using in each case the same ratio of oxygen atom weight to iron atom weight*.

Atomic weight.

Over the century and a half since Dalton, these ideas have been repeatedly tested by chemical experiments. No one now doubts that every chemical element has atoms of characteristic weight. By convention the number 16 0000 is ascribed to oxygen and called its "atomic weight". The atomic weights of other atoms are expressed by giving their ratio to that of oxygen, *e g*, hydrogen, 1 008, iron, 55 85. These numbers are only ratios, the real weight of one single oxygen atom is $2 7 \times 10^{-23}$ gm.

J J Thomson and the electron

Matter is electrically uncharged in its normal state, but there exist many well-known ways of producing electric charges and currents—rubbing amber, or rotating dynamos, for example. It is therefore necessary to have some theory of electricity linked to the theory of matter. The fundamental experiment in this field was made by J J Thomson when, in 1897, he discovered the electron.

If you take two metal electrodes sealed inside a glass vessel, and if the air is suitably pumped out and a high voltage applied to the electrodes, then the negative one emits a radiation which causes the walls of the tube to glow. The rays are called *cathode rays*. The discovery of the electron was essentially a clarification of the nature of cathode rays. Thomson showed that they were streams of particles with mass and negative electric charge and a general behaviour unlike any other atomic particle known at that time. The importance of this discovery for the world of science cannot be overestimated, and its technical progeny are in every home and factory in radio valves, television tubes, and other devices.

Rutherford-Bohr atom

Since the electrons emerge from matter, they are presumably parts of atoms. The relation between the negative electrons and the positively charged constituents of matter was elucidated by the great experimenter Rutherford and the great theoretician Bohr. Their work, just before the First World War, showed that the positive charge, together with almost all the mass, is concentrated in the central core or nucleus of the atom about which the very light-weight electrons revolve. The diameter of an atom is about 10^{-8} cm., roughly one-three hundred millionth part of an inch. The central nucleus has a diameter about 10,000 times smaller still. The nucleus and the electrons hold together because of the electric attraction between them.

At this stage work could, and did, go on separately along several different lines.

(i) Electrons could be studied on their own. Nowadays the handling of beams of electrons of all sizes and intensities has become a major industry.

(ii) The nucleus could be treated as a special problem, and this led to the mid-century flowering of nuclear physics, to the atomic bomb, and to nuclear power.

(iii) The behaviour of electrons in the atom could be analysed, this is the great domain of atomic physics which spreads into many other sciences as well.

Volumes have been written about each of these three fields, but we can spare only a few lines for each.

The Electron

Electrons are expelled from solids by light, heat, electric fields, and other influences. It has therefore been possible to study beams of electrons on their own *in vacuo*. Electrons inside matter, either as constituents, or temporarily in transit, can also be observed by their innumerable effects. These observations all show the particles to be indistinguishable one from another, all electrons are the same wherever they come from. They have a definite mass ($9 11 \times 10^{-28}$ gm), a negative electric charge, a magnetic moment, and a "spin" (intrinsic rotatory motion). No one has ever subdivided an electron or obtained an electric charge smaller than that on one electron. The electronic charge is therefore used as a basic unit of charge in atomic physics. The electron has come to be the best known of all the "fundamental particles".

The Nucleus

The early research programmes in nuclear physics were greatly facilitated by the occurrence in nature of certain unstable (radioactive) nuclei which emit fast-moving fragments. The latter can be used as projectiles to aim at other nuclei as targets, the resulting impacts yield much valuable information. This technique still dominates nuclear physics, though nowadays the projectiles are artificially accelerated by one or other of the large costly machines designed for the purpose.

The most important early discovery was that the nucleus consists of two types of fundamental particle—the positively charged *proton* and the electrically neutral *neutron*. These two are of nearly equal mass (about 1,800 times that of the electron), and like electrons, have a magnetic moment and spin. The proton charge is equal to the electron charge, though opposite in sign. Consider a moderately complex nucleus like that of iron. This usually has 30 neutrons and 26 protons. Its atomic weight therefore depends on the total number of neutrons plus protons, but the total charge depends only on the number of protons—called the *atomic number*. The latter is denoted by *Z* while the total number of neutrons plus protons is called *mass number* and denoted by *M*. *Z* is also the number of electrons in the atom since the atom as a whole is electrically neutral. The atomic number determines the chemical nature of the atom (see below), so that by altering the number of *neutrons* in a nucleus we do not change the chemical species. It is therefore possible to find—and nowadays to make—nuclei of the same element which nevertheless differ slightly in weight because they have different numbers of neutrons. These are called *isotopes*. Iron isotopes are known with 26, 27, 28, 29, 30, 31, 32, and 33 neutrons, but all have 26 protons. Only those with 28, 30, and 31, and 32 neutrons occur naturally, the rest have been made.

Stable Isotopes

The protons and neutrons in a nucleus are bound together by strong forces called *nuclear forces*. In many cases, the forces are so strong that no particles ever escape and the nucleus preserves its identity. There are two hundred and eighty-four different combinations of neutrons and protons of this kind, and they are called the *stable isotopes*. The earth is largely composed of such stable isotopes, because any unstable ones have, in the course of time, spontaneously broken up into stable residues.

Nevertheless, there are some unstable nuclei left on earth. They give rise to the phenomenon of radioactivity which was discovered by Becquerel in 1893.

Unstable Isotopes: Radioactivity

Becquerel found that certain chemicals containing uranium gave off rays capable of blacken-

ing a photographic plate, and shortly afterwards Marie and Pierre Curie discovered more substances, including radium, which produce similar but stronger effects. By now, about fifty chemical elements having radioactive properties are known to exist on earth, some, like radium, being strongly radioactive, others, like potassium, being so weak that the radiations are difficult to detect. These are called the *natural radioactive isotopes*.

The main facts about radioactivity are as follows: it is a *nuclear* phenomenon and (with minor exceptions) proceeds quite independently of whatever the electrons in the atom may be doing. Thus, the radioactivity of an atom is not affected by the chemical combination of the atom with other atoms, nor by ordinary physical influences like temperature and pressure. The radioactivity consists of the emission by the substance of certain kinds of rays. The early workers, Rutherford being the giant among them, distinguished three kinds of rays labelled α, β, and γ. These are described below. Whatever kind of ray is examined, it is found that the radiation from a given sample decreases gradually with time according to a definite law which states that the intensity of radiation decreases by half every T seconds. The number T, called the half-life, is constant for each radioactive material, but varies enormously from substance to substance. For instance, radium decreases its activity by a half every 1,622 years, whereas the half-life of one of the polonium isotopes is about $0{\cdot}3 \times 10^{-6}$ sec.

α-, β-, and γ-rays

The three most well-known types of radioactive emission are quite distinct from one another.

(i) α-rays or α-particles consist of two protons and two neutrons bound together. They are ejected from the radioactive nucleus with one of several well-defined speeds. These speeds are high, often of the order 10^9 cm per sec. Two protons and two neutrons are the constituents of the nucleus of helium, and α-particles are thus fast-moving helium nuclei.

(ii) β-rays are moving electrons. They may emerge from their parent nucleus with any speed from zero to a definite maximum. The maximum speed often approaches that of light, and is different for each isotope. The electron has a positively charged counterpart, the positron (see below), and β-rays are sometimes positrons. To distinguish the two cases, the symbols β^- and β^+ are used. The naturally occurring β-radiations are almost all β^-.

(iii) γ-rays travel with the speed of light because they are in fact electromagnetic waves differing from light only in the extreme shortness of their wavelength. They have no electric charge.

It is unusual, though not unheard of, for the same radioactive substance to emit both α- and β-rays. On the other hand, γ-rays frequently accompany either α- or β-rays.

γ rays pass through matter easily; in fact, they are extra penetrating X-rays. α-rays can be stopped by thin sheets of tissue paper. α-rays brought to rest pick up a pair of electrons from the surrounding matter and become neutral helium atoms, and helium gas from this source is consequently found imprisoned in certain radioactive rocks. β-rays are intermediate in penetrating power between α- and γ-rays.

We must now try to interpret these observations.

Radioactive Disintegration

A nucleus is a collection of neutrons and protons interacting with each other and possessing collectively a certain amount of energy. Just as some human organisations lose their coherence if they accept too many members, so nuclei can remain stable only if (i) the total number of particles is not too great, and (ii) neutrons and protons are there in suitable proportions. Radioactive nuclei are the ones for which either or both these conditions do not hold. Sooner or later such nuclei eject a fragment, thus getting rid of some energy they cannot contain. This is called a *radioactive disintegration*, and the fragments are the α-, β-, and γ-rays. α-emission relieves a nucleus of two neutrons and two protons and some energy. γ-emission simply carries off excess energy without altering the number or kind of particles left behind. β-emission is more complicated. There are no electrons normally present in a nucleus, but they are suddenly created and explosively emitted if a neutron changes into a proton; positive electrons are similarly generated if a proton changes into a neutron. β-emission is therefore a mechanism for changing the ratio of protons to neutrons without altering the total number of particles.

Both α- and β-emission change the Z of a nucleus, and the product, or daughter nucleus, is a different chemical element. α-emission also changes the M. It might happen that the daughter nucleus is unstable, in which case it too will disintegrate. Successive generations are produced until a stable one is reached. Part of such a family tree is shown below. The symbols above the arrows show the kind of rays emitted at each stage, the figures are the mass numbers, M, and the names and symbols of chemical elements can be found on **N30**.

$$U^{238} \xrightarrow{\alpha} Th^{234} \xrightarrow{\beta} Pa^{234} \xrightarrow{\beta} U^{234} \xrightarrow{\alpha} Th^{230} \xrightarrow{\alpha}$$
$$Ra^{226} \xrightarrow{\alpha} Em^{222} \xrightarrow{\alpha} Po^{218} \xrightarrow{\alpha} Pb^{214} \xrightarrow{\beta} Bi^{214} \xrightarrow{\beta}$$
$$Po^{214} \xrightarrow{\alpha} Pb^{210} \xrightarrow{\beta} Bi^{210} \xrightarrow{\beta} Po^{210} \xrightarrow{\alpha} Pb^{206}$$

(Pb^{206} is stable lead)

This family exists naturally on earth, because the head of the family, U^{238}, has so long a half-life ($4{\cdot}5 \times 10^9$ years) that there has not yet been time enough since its formation for it to have disappeared.

Artificial Radioactivity

Nowadays many new radioactive isotopes can be man-made. All that is required is to alter the M or Z (or both) of a stable isotope to a value which is incompatible with stability. The means for doing this is *bombardment*, *i.e.*, stable nuclei are exposed to the impacts of atomic particles such as streams of protons from an accelerator, the neutrons in an atomic reactor, or simply the α-particles from another radioactive substance. The new material is called an *artificially radioactive isotope*. Artificial radioactivity is not different in kind from that of the naturally radioactive substances, but the half-lives are usually on the short side. Indeed, the isotopes in question would exist in nature but for the fact that their short half lives ensured their disappearance from the earth long ago.

Suppose a piece of copper is exposed to the intense neutron radiation in an atomic reactor at Harwell.

The more abundant of the two stable isotopes of ordinary copper has thirty-four neutrons and twenty-nine protons (*i.e.*, $Z = 29$, $M = 63$). In the reactor many (not all) of these nuclei absorb a neutron, giving an unstable copper nucleus with $Z = 29$, $M = 64$. When removed from the reactor the specimen is observed to be radioactive with a half-life of 12·8 hours. It is somewhat unusual in that it gives out both β^- and β^+ rays. Some nuclei emit electrons, leaving a daughter nucleus with one more positive charge than copper, *i.e.*, a zinc nucleus ($Z = 30$, $M = 64$). One neutron has become a proton, and the resulting zinc nucleus is stable. The others emit positrons, leaving behind a nucleus in which a proton has been turned into a neutron ($Z = 28$, $M = 64$); this is a stable nickel nucleus. The overall process is one example of the artificial transmutation of the chemical elements which is now a commonplace of nuclear physics. It was first discovered by Irene and Frederick Joliot-Curie in 1934.

Lack of a Complete Theory

Consider now a collection of, say, one million radioactive nuclei of the same kind. It is impossible to tell exactly when any one of them will disintegrate; it is a matter of chance which ones break up first. All we know is that, after a time equal to the half-life, only a half a million will survive unchanged. In general, the more excess energy a nucleus has, the more likely it is to break

up, and therefore the shorter the half-life of that particular nuclear species In principle, to calculate the half-life theoretically, one would have to have a reliable theory of nuclear forces and energies. This is still being sought after, so it is probably fair to say that while the laws of behaviour of radioactive isotopes are well and accurately known, the *explanation* of this behaviour in terms of the properties of protons and neutrons is by no means complete.

Some Uses of Radioactive Isotopes.

Much of the usefulness of radioactive isotopes arises from two facts (i) isotopes of a given element are chemically indistinguishable, (ii) much smaller amounts of radioactive matter can be detected by their radiations than by chemical means. Thus, if some radioactive copper is mixed with ordinary copper and the mixture subjected to some complex chemical process, the course taken by the copper through the reactions can be traced by observing its radiation This is called *tracer technique* It is a very powerful method, and by now has research applications in physiology, medicine, chemistry, soil science, genetics, botany, lubrication studies, and many more

The isotopes can also be used in medical diagnosis and treatment, and for industrial applications, such as detection of flaws in metals and measuring thicknesses of sheet materials

Nuclear fission—chain reaction

A discovery important not just for nuclear physics but for the whole of mankind was made by Hahn and Strassman in 1939 This was the discovery of nuclear fission in uranium One of the natural isotopes of uranium is an unstable one, U^{235}, with 143 neutrons and 92 protons It normally shows its instability by emitting α- and γ-rays If uranium is bombarded with neutrons, some U^{235} nuclei temporarily gain an extra neutron, which makes them even less stable This they show by splitting into two roughly equal parts, called fission fragments, together with two or three neutrons There are two highly important things about this disintegration One is that the two or three neutrons can promote further disintegrations in other uranium nuclei, and the process can therefore be self-propagating, it is then called a *chain reaction*. The other is that the total mass of the fission products is less than that of the original nucleus This mass difference does not disappear without trace, it turns into energy according to a formula referred to in a paragraph below (**F15(1)**).

Application of these new forces

The world has found two uses for the energy liberated in nuclear chain reactions, the atomic bomb and nuclear power plants In the first, conditions are arranged to promote and encourage a tremendous and rapid chain reaction leading to an explosion, in the second, the steady liberation of energy in the form of heat is controlled for use in turbines which can generate electricity or provide propulsion Both uses represent epoch-making technical achievements, but mankind has yet to show itself capable of bearing sanely the burden of responsibility which nuclear physicists have laid upon it One thing is certain: the discoveries will not cease Already, other fissionable elements have been made and used, new chemical elements have been created; nuclear plants (" atomic piles ") have stimulated great demands for new materials that will stand the heat and radiation inside the reactor, and this promotes research in other fields of science, irradiation inside an atomic pile gives new and potentially useful properties to old materials, nuclear power drives ships and aircraft. It is difficult to write even briefly about contemporary nuclear physics without feeling keenly the ambiguity of its powerful promises.

Although so much is known about the behaviour of nuclei, the theory of the nucleus leaves much to be desired What holds the neutrons and protons together? Why are some nuclei more stable than others? It is certain that the forces between neutrons and protons in a nucleus are unlike the electrical attractions between the nucleus as a whole and its surrounding electrons Nor have they anything to do with gravitation. Indeed, the best description and explanation of nuclear forces is the objective of much of the contemporary research effort in nuclear physics

Atoms

A nucleus surrounded by its full complement of electrons is an electrically neutral system called an atom Neither the atom as a whole, nor its nucleus, counts as a " fundamental particle " because either can be subdivided into more elementary parts, thus

$$\text{atom} \longrightarrow \text{electrons} + \text{nucleus} \longrightarrow \text{electrons} + \text{neutrons} + \text{protons}$$

The chemical identity of the atoms of a given element, which was Dalton's key idea, depends entirely on the number and motion of the electrons For example, the simplest element, hydrogen, has one proton for a nucleus, and one electron The latter is comparatively easily detached or disturbed by the electric forces exerted by neighbouring atoms, consequently hydrogen is reactive chemically, *i e*, it readily lends its electron to build chemical structures with other equally co-operative elements The second element, helium, has a nucleus of two protons and two neutrons, outside are two electrons in a particularly stable arrangement Indeed, this pair of electrons is so difficult to disarrange that a special name has been coined to cover such cases —*closed shells* Helium, with its closed shell, will not react chemically with anything As the nuclear charge increases, different electron arrangements of greater or lesser stability succeed one another, with every so often a closed shell corresponding to one of the chemically inert gases neon, argon, xenon, krypton

Such considerations, pursued in sufficient detail, enable atomic physics to account for all the differences and similarities among the chemical elements and, in principle at least, for the other facts of chemistry as well

Ions.

It is possible to remove one or more electrons from an atom, leaving it positively charged The atom is then said to be *ionised* and is called a *positive ion* Alternatively, some atoms are capable of accepting electrons above their normal complement, thus becoming negative ions The behaviour of ions is very important in many fields of physics and chemistry, and some of these will be referred to later

Molecules

Electrical attractions of various kinds cause atoms and ions to form compound groups This is the basis of chemical combination, and the smallest conceivable fragment of compound which still preserves the chemical identity of that compound is called a molecule Molecules have a wide range of complexity, from simple pairs of atoms to highly intricate spirals and chains composed of thousands of atoms

Excited atoms

Like the nuclei described above, atoms can be given excess energy and will then return to their ground state with the emission of radiation The excess energy usually resides in one of the electrons which is executing unusually violent motion. The electron returns to normal by releasing its excess energy in the form of light whose colour is characteristic of the atom involved. Herein lies the explanation of innumerable natural and technical phenomena, such as the colours of glowing gases whether they exist in the sun and stars, in auroræ, or in street-lamps and neon signs Herein also lies the reason for the importance of spectroscopy, which is the study of the characteristic radiation from excited atoms; for spectroscopy is not only a useful tool for the chemical identification of elements (" spectroscopic analysis ") but was one of the main routes along which twentieth-century physicists broke through to a knowledge of the inner nature of the atom.

Elementary Particles.

Neutrons, protons, and electrons are elementary particles—the building bricks of the physical world. They are by no means the only ones, indeed, by the beginning of 1963 something like ninety kinds had been discovered. Such multiplicity raises difficult questions of how "elementary-ness" is to be defined. For example, it may be hard to say whether two different particles are equally fundamental or whether one is merely an excited state of the other. This lack of a proper criterion reflects the prevailing inadequacy of the basic theory of elementary particles. A few more of the latter will now be introduced.

Various *mesons* and *hyperons* were discovered among the cosmic rays. Brief descriptions are given in the Table on **F14**. Nowadays these particles can be generated at will by bombarding matter with very energetic proton beams. This is the kind of experiment made possible by the largest accelerators at Brookhaven (U.S.A.) and CERN (Geneva) and new particles have been discovered this way.

Anti-particles

In 1932 positrons were discovered. They are like electrons except that their charge is positive. When positrons and electrons collide, they usually annihilate one another and turn into γ-rays. Mutual annihilation is characteristic of a particle and its "anti-particle", the positron can therefore be called the "anti-electron".

In general, for each particle there has been found a corresponding anti-particle, *e.g.*, anti-protons and anti-neutrons were discovered a few years ago in high energy particle experiments at Berkeley, California, and the positive mesons are the anti-particles of negative ones.

Neutrinos

At the moment of β-ray emission, the disintegrating nucleus also emits an energetic but uncharged particle called a neutrino. It was always supposed that this happened, because otherwise β-radioactivity would defy certain basic laws of mechanics (the conservation of momentum and angular momentum) which nobody was disposed to abandon. However, neutrinos are supposed to have no mass, and calculations show that they will traverse millions of miles of dense matter without leaving a trace, thus it was not until 1956 that an apparatus of sufficient sensitivity working near a strong source of neutrinos (an atomic pile) finally detected this more than usually shadowy particle.

Neutrinos also appear at the decay of π-mesons but an impressive experiment at Brookhaven in 1962 proved that these neutrinos are a different species, so two kinds (each with its anti-neutrino) have now to be accounted for.

Although certain patterns of behaviour are detectable among the elementary particles, no physicist would deny that in this field a major stroke of clarification would be very welcome.

Fields and Waves.

Maxwell and electromagnetic waves

Atoms are held together by the electric attraction of the nucleus for the electrons. Finer details of atomic behaviour depend on the magnetic moments of the particles. Any region of space subject to electric and magnetic influences is called an *electromagnetic field*. Before the discovery of the electron, Maxwell had perfected a general theory of the electromagnetic field, giving to physics a celebrated set of equations which describe satisfactorily almost all electric and magnetic phenomena. *Inter alia*, he proved that disturbances in the electric and magnetic conditions at one place could be propagated to another place through empty space, with a definite velocity, just as sound waves are propagated through air. Such electromagnetic disturbances in transit are called *electromagnetic waves*, and their velocity turned out experimentally to be the same as that of light and radio waves—which was a decisive argument to show that both of these phenomena are themselves electromagnetic waves.

Einstein and photons.

In the years between about 1900 and 1920 this view was upset by Planck, Einstein, Millikan, and others, who focused attention on phenomena (radiant heat, photoelectricity) in which light behaves like a stream of particles and not at all like waves. A wave and a particle are two quite different things, as anyone will admit after a moment's contemplation of, say, the ripples on a pond and a floating tennis ball. The acute question was: is light like waves or particles? This celebrated dilemma soon multiplied its horns. In 1927 electrons were shown to be quite capable of behaving as waves instead of particles, and this is now known to be true of protons, neutrons, and all other fundamental particles as well.

Theoretical physicists have devised means of having it both ways. To say that light behaves as particles means that the waves of the electromagnetic field cannot have their energy subdivided indefinitely. For waves of a given frequency, there is a certain irreducible quantity of energy that must be involved whenever light interacts with anything. This quantity is the product $h\nu$, where ν is the frequency and h is a constant named after Planck. Each such unit is called a *quantum of the electromagnetic field* or a *photon* and is counted as one of the fundamental particles. Frequencies and wavelengths vary widely, typical wavelengths are: radio—hundreds or thousands of metres, radar—a few centimetres, visible light—5×10^{-5} cm., X-rays—10^{-8} cm.

It is now accepted that every fundamental particle is a manifestation of the waves of one or other kind of field. Physicists speak of waves, particles, and fields in the same breath or rather the same equation. Little is to be gained by asking if electrons or photons are "really" particles or waves. All one can say is that they are things whose behaviour is predicted and described by certain equations. Those who must visualise can imagine particles in some phenomena and waves in others: neither conception contains the whole truth. Why should the ultimate invisible constituents of matter be forced into one or other category derived from everyday experience? For convenience, however, we shall continue to call these things "fundamental particles."

Quantum Theory

The point of view of the last paragraph is characteristic of quantum theory, which is the currently accepted fundamental theory of matter and motion. One can reasonably ask at what position in space, exactly, is a particle? Or, what, exactly, is the wavelength of a wave? But the first question cannot be reasonably asked of a wave, nor the second of a particle. Since electrons have something in common with both, one question cannot be answered precisely for electrons without ignoring the other; alternatively, both questions can be given an imprecise answer. As the wavelength of electrons is intimately connected with their speed, one has to accept an accurate knowledge of the speed (wavelength) and ignorance of position, or the converse, or *inaccurate* knowledge of both. This is the famous Heisenberg Uncertainty Principle. Quantum theory is a set of mathematical rules for calculating the behaviour of fundamental particles in accordance with the Uncertainty Principle. In spite of its equivocal-sounding name, the principle has led to an enormous increase in the accuracy with which physical phenomena can be described and predicted. Quantum theory includes all that previous theories did and more.

Quantum theory grew up in the same epoch as the Theory of Relativity. Heroic attempts have been made to combine the two, but with only partial success so far. Relativity is concerned with all motion and all physical laws, but its characteristic manifestations occur only when something is moving with nearly the velocity of light. Quantum theory is likewise all-embracing, but its typical phenomena almost always occur when something on the minute atomic scale is in question. Consequently, the vast majority of everyday mechanics needs no more than the classical theory laid down by Newton, which is neither relativistic nor quantum.

radiations with slightly different wavelengths. For example, the light from an atom in the intense field of a star should have slightly longer wavelength than the corresponding light from an atom on earth. This effect has always proved very difficult to detect with certainty. However, Einstein's prediction was verified with moderate accuracy in 1960 by a very subtle method which was purely terrestrial in its operation. The atoms being compared were placed at the top and bottom of a water tower and the difference in their emission was detected by means that belong rather to nuclear physics than to astronomy.

Conclusion.

Over a century's development of the atomic ideas has brought a progressive, if jerky, increase in the mathematical precision of the theories. In some fields of particle physics, observations to one part in a million, or even better, can be explained, to that level of accuracy, by the existing theories. At the same time, however, the theories have lost visual definition. An atom as an invisible but none the less solid billiard ball was easy enough, so was a light wave conceived like a sound wave in air. Even after Rutherford, an atom consisting of a miniature solar system merely exchanged the solid billiard ball for a system of revolving billiard balls and was no great obstacle to visualisation. But since quantum theory and the Uncertainty Principle, every unambiguous visualisation of fundamental wave-particles leaves out half the picture, and although the electrons are in the atom, we can no longer represent them in definite orbits. The moral seems to be that visualisation is unnecessary, or at best a partial aid to thought. All the theoretical knowledge is in the equations, and these are very precise. Hence the non-physicists' grumble—that physics is too mathematical these days—has some justification, and hence also the growing distinction in physics between the theoreticians, who are usually mathematically trained, and the experimenters, who can rarely read the papers their theoretical colleagues write, but provide the results for them to write about.

II. THE PROPERTIES OF MATTER IN BULK.

One of the most obvious and at the same time most wonderful things about the properties of matter is their great variety. Think of air, diamond, mercury, rubber, snow, gold, pitch, asbestos. . . Even the differences of state of the same chemical substance are remarkable enough, ice, water, and steam, for example. One of the aims of physics is to reach an understanding of all these different properties by explaining them in terms of the behaviour of the particles discussed in the previous section (**F9-15**). The widespread success with which this imposing programme has been carried out indicates the maturity of physics. It is difficult to think of any major property of matter in bulk for which there is not some attempted theoretical explanation, though future physicists will no doubt regard some present-day theories as rudimentary or incorrect.

Physics, Statistics, and Thermodynamics

Take a number equal to the population of London, multiply it by itself, and multiply the product by another million. The answer is about the number of molecules in 1 cubic centimetre of ordinary air. They are constantly moving about and colliding with one another. Even if the nature of the molecules and their laws of motion were perfectly understood, it would clearly be impracticable to calculate the exact paths described by each particle of so vast an assembly. This difficulty brought into being a whole branch of physics concerned with calculating the overall or average properties of large numbers of particles. Just as statisticians will provide the average height, income, expectation of life, and so on, of the population of London, without knowing everything about every individual, so statistical physicists can work out average properties of molecules or atoms in large groups. This important branch of physics is called *Statistical Mechanics*. It was founded in the nineteenth century by Maxwell, Boltzmann, and Gibbs and is still being actively developed.

Consider now all the molecules in 1 cubic centimetre of air contained in a small box. They are continually bombarding the walls of the box and bouncing off. This hail of impacts (it is actually about 10^{23} impacts per square centimetre per second) is the cause of the pressure which the gas exerts against the walls of the box. Now suppose we pump air in until there is twice as much as before, though the box is still the same size and at the same temperature. This means that the density of the gas (*i.e.*, the mass of 1 unit of volume) has doubled. We should now expect twice as many impacts per second on the walls as before, and consequently twice the pressure. We therefore arrive at a conclusion that, if the volume and temperature are constant, the pressure of a gas is proportional to its density. This is one of the simplest statistical arguments that can be checked against observation; in fact, it stands the test very well.

Heat, temperature, and energy

The proviso about the temperature remaining the same is an important one for the following reason. In the nineteenth century there was much discussion about the nature of heat. To Joule we owe the now well-established view that heat is equivalent to mechanical work. In one of his experiments, in the 1840s, the work necessary to rotate paddle wheels against the resistance of water in a tank generated heat that caused a slight rise in the temperature of the water. Joule found out exactly how much work was equivalent to a given quantity of heat. However, one can do other things with work besides generate heat, in particular, work creates motion, as when one pushes a car. Bodies in motion possess a special form of energy, called kinetic energy, which is equal to the work done in accelerating them from a state of rest. We have, then, three closely connected ideas: work, heat, and kinetic energy. Now according to the views of the nineteenth century, which are still accepted, any heat given to a gas simply increases the kinetic energy of its molecules; the hotter the gas, the faster its molecules are moving. If, therefore, the gas in our box is allowed to get hotter, there is an increase in molecular speed, and the impacts on the walls become correspondingly more violent. But this means the pressure increases, so we have another law: if the density remains the same, the pressure increases if the temperature does.

Laws of Thermodynamics

Such considerations as these have been pursued with great elaboration and subtlety. The notions of heat, temperature, energy, and work—familiar but vague in everyday life—have been given precise definitions, and the relations between them have been enshrined in the Laws of Thermodynamics. Enshrined is perhaps a suitable word, because these laws are so soundly and widely based on experimental results that they have greater prestige than any others in physics. If any proposed physical law comes in conflict with thermodynamics, then so much the worse for that law—it has to be revised. It is sometimes asserted that no one is properly educated who does not understand the Second Law of thermodynamics. We cannot, therefore, leave this section without at least stating the two best known thermodynamic laws:

First Law: *If any physical system is given a quantity of heat, and if the system performs some work, then the energy of the system increases by an amount equal to the excess of heat given over work done.* This law asserts that heat, energy, and work are convertible one into the other, and that all such transactions balance exactly. This is one form of a principle accepted as fundamental in all science, *viz.*, the Principle of the Conservation of Energy, according to which energy can never be created or destroyed, but only changed from one form to another.

Second Law: *It is impossible to make an engine which will continuously take heat from a heat source and, by itself, turn it all into an equivalent*

amount of mechanical work. In fact, all engines which produce work from heat—steam engines for example—always use only a fraction of the heat they take in and give up the rest to some relatively cool part of the machine. The Second Law makes this obligatory on all work-from-heat devices. This statement of the Second Law has an engineering ring about it and, indeed, it arose from the work of the nineteenth-century French engineer Carnot. Nevertheless, it can be rephrased in very abstract terms, and has been applied with unbroken success to all fields of science involving the transfer of heat and allied matters. It sets a definite limit to the kinds of physical process that can be conceived to take place. Nothing has been known to contravene it.

The States of Matter

The molecular motion in gases has been referred to in the previous section. Tacitly it was assumed that each molecule acted independently of all others, except that collisions occurred between them. In reality, molecules exert attractive forces on one another and, if a gas is cooled so that molecular movements become relatively sluggish, a time comes when the attractive forces succeed in drawing the molecules close together to form a liquid. This process is called condensation.

The molecules in a liquid are packed tightly together and they impede each others' movements. On the other hand, movement still persists, and the molecules struggle about like people in a milling crowd. Besides wandering about, the molecules vibrate. These motions represent the energy contained in the liquid.

The fact that the molecules, though irregularly packed, can still slip past one another and move from place to place, explains the essential property of liquids that distinguishes them from solids—ability to flow. As a matter of fact, although the rather vague assertion that in a liquid molecules are irregularly packed would be generally accepted, there is no agreed opinion on what the irregularity is actually like. Indeed, not only the precise structure of liquids, but the theory of liquids in general, is fraught with such considerable mathematical difficulties that the liquid state is much less well understood than the solid or gaseous.

Most solids are crystals. The popular idea of a crystal is of something which has a more or less regular geometrical form with faces that glint in the light—like snowflakes or gems. However, crystallinity really depends on a regular inner pattern of the atoms, and may or may not show itself on the visible surface. A lump of lead, for example, is crystalline, though it may not look it.

The actual arrangement of the atoms in a crystal can be extremely complex. Some are quite simple, however. The largest model of a crystal structure must surely be the 400-ft "Atomium" building in the 1958 Brussels Exhibition. This consisted of eight balls, representing atoms, situated at the corners of a cube, and one more ball exactly in the middle. Imagine this repeated in all directions so that every ball is the centre of a cube whose corners are the eight neighbouring balls. This is known to crystallographers and physicists as the "body-centred cubic structure"; it is the actual arrangement of atoms in iron, sodium, chromium, and some other metals. If every ball, instead of being the centre of a cube, were the centre of a regular tetrahedron (a solid figure with four equal triangular faces), and had its four neighbours at the corners of the tetrahedron, then we should have the "diamond structure". This is how the carbon atoms are arranged in diamonds.

In crystals the atoms are locked into a regular ordered structure by attractive forces which give the solid its rigidity and prevent it from flowing. The atoms are so close together that any attempt to press them closer involves crushing or distorting the atoms—a process they resist strongly. This explains why solids (and liquids too) are so difficult to compress. Gases can easily be compressed because there is so much space between the molecules.

The distinction between solid and liquid is not so sharp as is commonly supposed. A lump of dough will not bounce, but is plastic; a steel ball-bearing is very elastic and bounces excellently, but one cannot mould it in the fingers. Neither dough nor steel qualifies for description as a liquid. There are, however, substances which can be moulded like plasticine into a ball that will then bounce very well on the floor like an elastic solid, and finally, if left on a flat table, will spread into a pool and drip off the edge like a liquid. There is no point in trying to force such things into rigid categories. One may say instead that for short, sharp impacts the material behaves like an elastic solid, but under long-sustained forces it flows like a liquid. The properties of these, and many other anomalous materials, are increasingly engaging the attention of those who study the science of flow—*rheology*. It is interesting to see how many familiar and important materials exhibit peculiar rheological behaviour—paint, dough, ball-pen ink, cheese, unset cement, and solutions of nylon and other plastics are only a few examples.

Inside a Crystalline Solid.

We now return to our wallpaper analogy of crystal structure and give some free play to our visual imagination.

Suppose we have walls papered with a regular pattern of, say, roses, fuchsias, and green leaves. These represent the different kinds of atoms in the solid. Careful observation shows that the whole pattern is shimmering. The flowers and leaves are not stationary, but are undergoing slight random oscillations about their proper positions. In a crystal these movements are called thermal vibrations, and are never absent. The hotter the crystal, the more the vibration, and at a high enough temperature the vibrations become so great that the atoms get right out of position and the pattern disappears altogether, *i.e.*, the crystal melts. Thermal vibrations are essential to the theory of solids, and are responsible for numerous physical properties.

Next we note something extraordinary about some of the papered walls. On these the paper has been hung in irregular patches fitted together like a not very well-made jig-saw puzzle. Lines of roses which should be vertical are horizontal in some patches, oblique in others. This represents the situation in most ordinary solids, for they consist of many small pieces of crystal irregularly packed together. Such material is called *poly-crystalline* and the small pieces are *crystal grains*. Crystal grains may be almost any size, sometimes visible to the naked eye, as often on galvanised iron.

However, on one wall, we see excellent regularity and no obvious patches at all. The physicist would call this a *single crystal*, and several techniques exist for preparing them. Natural single crystals can be found, and there are some beautiful large single crystals of rock salt. But on examining the single crystal wall closely, we find a number of places where the paperhanger has failed to make adjacent pieces register perfectly—there is a slight disjointedness. This occurs in real single crystals, and the line along which the structure fails to register is called a *dislocation*. These are much studied by physicists because of their bearing on the mechanical properties of solids, on the yielding of metals under strong stress, for instance.

This by no means exhausts the possibilities of the wallpaper analogy; several other phenomena can be found. For example, in a place where there should be a fuchsia there is actually a daffodil—something completely foreign to the pattern. Or perhaps a small wrongly shaped leaf is jammed between the proper leaves in a place that should really be blank. These represent chemical impurity atoms. The first is called *substitutional*, because it occupies the position o an atom that should be there, the second is called *interstitial*, because it does not. Substitutional impurities of indium metal, deliberately added to the semi-conductor germanium, make possible the manufacture of transistors (*see* **Section L**). Some steels derive their valuable properties from interstitial carbon atoms within the iron pattern.

What physicists call a vacancy would occur if a flower or leaf were simply missing. Remembering that all the atoms are vibrating, we should not be surprised if occasionally an atom jumps into a neighbouring vacancy if there happens to be one,

Thus by repeated mitotic divisions the body of the organism is built up. An important difference between most animals and most plants lies in their method of development. In animals there is a relatively short period of development and the body grows as a whole until the adult size is reached, although repair and replacement of tissues may occur throughout life. In higher plants, on the other hand, the roots and shoots are able to grow continually by means of permanently embryonic apical regions.

Chemistry of the Living Cell.—Ever since cells were first detected by Robert Hooke over 200 years ago with the aid of the optical microscope, the way in which cells grow and reproduce themselves has puzzled scientists. In this century biochemistry has made tremendous progress, and our knowledge of the chemistry of life is very rapidly expanding, due in no small measure to the availability of isotopes (**F10**). With the aid of compounds prepared in the laboratory and labelled with either radioactive or heavy isotopes of elements such as carbon, hydrogen, nitrogen, oxygen, sulphur, and phosphorus, biochemists can now follow the metabolic fate of these substances in living organisms. By these means it has been discovered that life is a dynamic process, that each part of the human body, for example, is continually breaking down and being replaced with new material. It is possible to find out just how each constituent is made and how long it stays in the body before it is replaced, and where and how this takes place. It is also possible to carry out many of the complex chemical reactions of living matter, *in vitro*, by making use of isolated enzyme preparations. It is becoming increasingly apparent that each individual process of life is a discrete chemical reaction but that life itself consists of many thousands of such reactions, all interdependent and all co-ordinated togther within the living cell, which has an average diameter of not more than a hundredth of a millimetre. The complexity of these chemical reactions and their diversity is well illustrated if one considers a single sperm cell, which by chemical reaction alone is capable of giving the necessary information to set in motion all the chain of reactions which will eventually lead to the creation of a replicate form of life.

Pattern of Chemical Organisation.—In the last decade our knowledge of the chemical organisation within the cell has also rapidly and dramatically increased. This has been brought about largely by the intense research into the cause of cancer, which is primarily a disease of abnormal cell growth. Cytochemists have been trying to find out why a cell should change its usual pattern of reproduction and rapidly grow in an uncontrolled abnormal form. The development of the electron microscope has greatly aided them in their understanding of the internal structure of the cell. With this instrument it is possible to obtain sharp images of particles as small as 20 Angstroms (2×10^{-7} cm) in diameter, and so, many structures within the cell which were not apparent with the optical microscope are now clearly visible. This, together with recent advances in the techniques of isolating without damage important parts of the cell, has revealed a common pattern of organisation in the majority of cells. It is now known that the protoplasm itself has a very definite structure. When suitable preparations are examined with the electron microscope numerous cylindrical or spherical particles, the mitochondria, together with a finer structure, the endoplasmic reticulum, are detected. On disintegrating the cell, the latter breaks up into a mass of fine particles which are called microsomes. Within the protoplasm there is another non-particulate section called the Golgi apparatus, named after its discoverer. Attempts to isolate these various fractions were for many years unsuccessful, the small mitochondria for example, were very easily damaged, especially by changes in osmotic pressure, and when treated with weak salt solutions much of their biochemical activity was destroyed. These difficulties have now been overcome, and it is possible to isolate nuclei, mitochondria, and microsomes uncontaminated with each other and still in a highly active biochemical state. Rat-liver cells are a very convenient source, although any soft tissue, such as lungs, heart, brain, or muscle could be used. Small pieces of the tissue are ground in a Potter–Elvehjem homogeniser, which is essentially a glass tube with a well-fitting plunger. The liver cells themselves are disrupted, but the smaller particles within the cells, and red blood cells, escape destruction. The homogenate is then centrifuged in sucrose solution. The heaviest particles, the nuclei, are deposited first on the bottom of the centrifuge tube, and the supernatant liquid is then transferred to another tube and centrifuged again at a higher speed, thus bringing down a deposit of mitochondria. On centrifuging this supernatant liquid at a very high speed which exerts a force equal to 100,000 times gravity the microsomes are obtained. These separate fractions after careful washing can then be suspended in suitable reaction media and their biochemical reactions studied separately without interference from other cell constituents.

The Nuclei.—The nuclei are of prime importance to the life of the cell, for if one dissects an amœba, a unicellular organism, so that one half contains the nucleus, this half will continue to live and reproduce normally, but the other half, which is merely a sphere of protoplasm, soon ceases to move and eventually dies. The fact that the protoplasm continues to react biochemically for some time after enucleation can be demonstrated by the way in which it utilises radioactive phosphorus. If, however, a nucleus from another amœba is placed inside this protoplasm, then it will continue to live and reproduce normally. The nucleus therefore controls the normal metabolic processes and is also essential for reproduction.

DNA and Cell Division.—The chromatids which separate and become the chromosomes of the daughter nuclei at mitosis are formed by longitudinal splitting of the chromosomes of the parent nucleus. These chromosomes must transmit in some chemical form all the information for the new cell to replicate its parent. Chemically the chromosomes consist of deoxy-ribonucleic acid, DNA, which is structurally a long polymer of smaller chemical fragments called nucleotides. Each nucleotide consists of one of the four nitrogenous bases, adenine, guanine, cytosine, or thymine, a sugar, deoxyribose, and phosphoric acid all linked to one another. DNA is the genetic material of the cell, and all the hereditary information that the genes contain is thought to be transmitted by the order in which the four bases are arranged on the long polymeric molecules of this substance. By analysing the X-ray-diffraction patterns of DNA, Watson and Crick at Cambridge have shown that the molecule consists of two long intertwined helices. At cell division it is thought that these two spirals separate, one half going to each cell, there they act either as a mould or a cast, forming a new spiral on their surface which is a replica of the one from which they have just parted. A simple analogy is to consider a toy lead soldier in a mould, if one separates the soldier from the mould and then makes a new soldier in the mould and uses the original soldier to make a new mould, one then has two identical sets of soldiers and moulds.

RNA and the Nucleolus.—The way in which DNA in the nucleus transmits its information to the rest of the cell is thought to be by means of another nucleic acid, ribonucleic acid, RNA, which also consists of chains of nucleotides. In this case the nucleotides consist of one of the four bases, adenine, guanine, cytosine, or uracil, linked with a sugar, ribose, and phosphoric acid. RNA is the chief chemical constituent of the microsomes. On studying the nucleolus with the electron microscope, numerous small particles are easily discernible, and these are very similar to the microsomes in the protoplasm. Not only are these RNA-containing particles present in the nucleolus but they are also seen to be clustered around the outer membrane of the nucleus. The

electron microscope has shown that this membrane contains numerous pores which would thus enable these particles to escape into the surrounding protoplasm and so carry to the rest of the cell the information which has been genetically transmitted *See* Part IV. The Genetic Code.

The Microsomes.—The smallest particles obtainable from a cell homogenate are the microsomes, and the electron microscope has shown that these are really very small fragments of the disintegrated endoplasmic reticulum They consist chiefly of RNA By means of very elegant isotope studies, Borsook in the U S A has shown that these particles are in all probability responsible for protein synthesis Proteins (*see* Section L) are always associated with life, but in fact they are only complex organic compounds When pure, some proteins can be obtained in a crystalline state All the proteins can be split up easily into their component amino-acids there are about twenty different naturally occurring amino-acids Proteins differ from each other by the sequence in which these simple units are joined together There are many different kinds of proteins, such as collagen, the structural protein of the skin, and keratin, the protein of hair

Site of Enzyme Synthesis.—One of the most important classes of proteins are the enzymes These substances are responsible for bringing about most of the chemical reactions inside the cell, their functions are very varied, each enzyme being highly specific for any particular reaction Before a cell can grow therefore it has to be able to make enzymes, which are not transmitted as such by the DNA of the dividing nucleus, these enzymes are made by the microsomes When a synthetic amino-acid containing a radioactive carbon atom is ingested by a living organism it becomes incorporated fairly rapidly into all the proteins Borsook decided to study the incorporation of an amino-acid as soon as possible after its administration in order to determine the site of protein synthesis He injected a radioactive amino-acid into the tail vein of a rat, and after two minutes removed the liver and isolated the nuclei, mitochondria, and microsomes He found that the proteins of the microsomes were radioactive, whereas the proteins of the other fractions were not, thus showing that the site of synthesis was probably the microsomal particles If the microsomes are washed with a detergent-like substance, desoxycholic acid, they are further disintegrated into smaller particles, similar small particles can also be seen adhering to the endoplasmic reticulum when it is carefully studied with the electron microscope It is these particles which Borsook showed to be the sites of synthesis of protein and, owing to their small size, it is not improbable that each is responsible for the synthesis of one enzyme or one type of protein, which is then discharged into the protoplasm How, then, do these particles bring about the orderly synthesis of a specific protein? It is thought that the RNA which they contain, acts as a template and that amino-acids previously activated or given sufficient energy to combine easily with one another, are orientated in a definite sequence on a molecule of RNA, after all the amino-acids have joined together to form the protein molecule this is then released into the cell, leaving the RNA free to repeat the process Variations in the structure of the RNA molecule would lead to the synthesis of different proteins.

The Mitochondria—Some mitochondria are visible in a cell when it is examined with an optical microscope, but they become much more readily apparent under the electron microscope They are usually cylindrical in shape, but this varies with the type of cell, and under certain conditions they are spherical When seen in a living cell they are in constant motion They have two outer membranes, the inner one being very convoluted. A rat-liver cell contains about a thousand mitochondria, but in other types of cells the number and distribution of these particles within the cell varies.

The Energy Source of the Cell.—The function of mitochondria is to provide energy for the reactions of the rest of the cell, they are found to be most numerous in those cells requiring most energy and, moreover, are usually grouped within the cell at strategic points for this purpose Thus in a muscle cell they are grouped around that part of the protein fibre which contracts, and in a sperm cell they are in highest concentration in the neck of the cell where the head joins the vigorously moving tail How do mitochondria provide this energy? When food, especially carbohydrates enters the body it is broken down into smaller chemical fragments until some of it is converted to pyruvic acid, this can also be derived from some fats and amino-acids These reactions take place outside the mitochondria, and the pyruvic acid then passes through the semi-permeable mitochondrian membrane to be further metabolised, within the mitochondria, by a series of enzymes In this sequence of reactions, known as the citric acid cycle, carbon atoms are oxidised one at a time to carbon dioxide, which is then eventually exhaled from the body In this process energy is liberated not in the form of heat but in the form of an energy-rich compound, adenosine triphosphate, ATP The mitochondria produce far more energy than they themselves require, and the excess is passed into the cytoplasm as ATP for the use of the rest of the cell Not all biochemical oxidations are brought about by the direct action of oxygen, the mitochondria contain enzymes for the removal of hydrogen ions and electrons, and these are passed in a series of reactions from one compound to another until they eventually combine with oxygen to form water

Control of Cell Metabolism.—When mitochondria are isolated in a pure state from a cell and suspended in solutions of various nutriments they swell and alter shape, this being due to the passage of these compounds through the semi-permeable membrane of the mitochondrial wall. One of the compounds which has a very marked influence on the shape of mitochondria is the hormone, thyroxine The function of this hormone in the body is to control the rate of metabolism, *i e*, the rate at which energy is provided and utilised, it is possible that it achieves this by acting on the mitochondria and so controlling the formation and release of energy The movement of the mitochondria in the living cell may be an indication of their state of activity As they alter in shape they expose different parts of their internal structure to the available reactants and also release into the surrounding protoplasm the compounds needed for the metabolism of the rest of the cell The mitochondria can be broken into fragments by changes in osmotic pressure or by subjecting them to ultrasonic vibrations It is then found that the different enzyme systems that they contain are associated with certain parts of the mitochondria, some of these enzymes are soluble and escape into solution, while others, especially the hydrogen-transferring enzymes are associated with the non-soluble fraction This can be shown, by electron microscopy, to be similar in appearance to the structural membranes of the mitochondria As more detailed electron-microscope studies of the mitochondria are made it is becoming increasingly apparent that they themselves have a detailed and intricate structure and that the enzymes they contain are arranged in a definite order

Summary.—From this outline of the functions of the particulate fractions of the cell, it is clear that there is much organisation and division of labour within the living cell The nucleus, by virtue of its DNA, controls not only the pattern of reproduction but also the general metabolic processes of the cell It does this by sending out microsomal particles of RNA, which in turn bring about the synthesis of proteins and enzymes None of this would be possible, however, without the source of energy which is provided by the mitochondria as ATP Other minute structures, such as the Golgi apparatus, have also been found in living cells, but nothing definite is yet known of their biochemical functions.

THE CLASSIFICATION OF ORGANISMS.

There are many uni-cellular, microscopic animals and plants, as well as thousands of multi-cellular ones of diverse kinds. The naming and classifying of this vast assemblage of living things has received the attention of man for centuries. At first the main interest was a practical one, to recognise those which were useful as food, fuel, and medicine and also those which were harmful or poisonous to human beings. With the exploration of the earth by Western man so many new types of animals and plants were found and brought back to Europe that a uniform system of naming and classification became imperative, and over the last 300 years such a system has been slowly built up. It was soon realised that some species were very similar and could be grouped together in what are now known as genera and that these could be grouped together into recognisable families and so on. With the general acceptance of Darwin's conception of evolution a new element was introduced into the problems of classification. Obviously a satisfactory classification of a group of organisms should reflect the past history or evolution of that group. Thus the aim of the present-day taxonomist who is concerned with such matters is to produce a natural classification based on phylogeny or true relationships. Our knowledge of this must always be incomplete, even if only because of the incompleteness of the geological record. Hence there is no finality in any proposed classification, which may have to be drastically modified as new facts about all aspects of living things are discovered.

CLASSIFICATION OF ANIMALS.

As indicated in the chart, the animal kingdom is usually divided into two groups, the invertebrates and the vertebrates. The former includes a number of distinct groups which are arranged in order of complexity. However, this arrangement does not necessarily indicate close relationships between them. Strictly the invertebrates are to be distinguished from the chordates, *i.e.*, animals possessing a longitudinal skeletal structure, the notochord. In two small groups, the hemichordates and the urochordates, this structure is still present, but in the largest group, the euchordates or vertebrates, the notochord is replaced by a cartilaginous or bony backbone. The five groups of living vertebrates are clearly distinct, but the fossil record indicates that the order in the

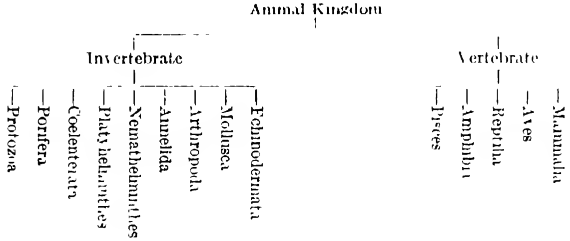

chart reflects their evolution in time. Thus the first true vertebrates were the fishes, and from these arose the amphibia. The amphibia gave rise to the reptiles, and both the birds and mammals evolved from different unspecialised reptilian stocks.

Protozoa.—These are all microscopic animals which are unicellular, though some may have more than one nucleus and others form colonies. Many are able to swim by waving hair-like flagella or cilia. Others, such as *Amœba*, exhibit a kind of flowing movement, parts of the cell putting out pseudopodia which are followed by the rest of the cell. Protozoa are found in all types of habitat, they are abundant in the soil and fresh-water, and many of the most beautiful forms occur in the floating plankton of the seas. Others are important diseases of man, and include *Trypanosoma*, which causes sleeping sickness, and *Plasmodium* the malarial parasite.

Porozoa.—The sponges are fixed, multicellular aquatic animals, most of which are marine. Basically a sponge consists of a central cavity surrounded by two layers of cells, although the body may be branched and plant-like in form. Between the two layers of cells is a thin, gelatinous tissue containing calcareous or siliceous spicules which may be fused to form a rigid skeleton. Water is drawn in through many inhalant apertures and is passed out of the single apical exhalant aperture. Minute food particles present in the water are ingested by the inner wall cells.

Cœlenterata.—These are aquatic animals with a two-layered wall surrounding a central cavity which has only a single opening. This mouth is often surrounded by tentacles which bear many specialised stinging cells. A few live in fresh water, such as the solitary *Hydra*, but most are marine. The corals are colonial, and the remains of their calcareous skeletons form the large reefs and atolls common in the Pacific Ocean. Other familiar members of this group are sea-anemones, jelly-fish, and the floating Portuguese-man-of-war.

Platyhelminthes.—These are the worms which have soft, bilaterally symmetrical, and usually flattened bodies. The body tissue originates from three embryonic cell layers, and no body cavity is present. Some have a mouth and digestive tract, but these may be absent, and there is no blood system. The group includes the small fresh-water, free-living flatworms and also internal parasites, such as the liver-fluke which attacks sheep and the tape-worms which live in the gut of dogs, poultry, and man.

Nemathelminthes.—The round worms may be microscopic or up to 2 ft. in length. The body is smooth and pointed at both ends and has a digestive tract but no body cavity or blood system. Although they can move actively, they are unable to progress in any direction. The round worms occur everywhere, in water, in soil, and some, such as *Ascaris*, are parasites in the gut of various animals.

Annelida.—These are the worms with segmented bodies. Due to this feature, waves of muscular contraction can occur along the length of the body, and directional movement is possible. Usually they have a digestive tract open at both ends, a body cavity, and a blood system. The group includes the common earthworm, *Lumbricus*, many marine worms, and the leeches.

Arthropoda.—This large group of animals has the general characters of the annelids, but there is usually a hard exoskeleton, each segment bears a pair of appendages which may have various functions, and the blood is contained in the body cavity. Further, they possess a simple "brain" at the front end of the body. The most important classes are:

Crustacea.—Mostly true aquatics which have two pairs of antennæ. Included here are the crabs, shrimps, wood-lice, water-fleas, and the sedentary barnacles

Myriapoda —These are the millepedes and centipedes which have only one pair of antennæ and numerous pairs of legs

Insecta —This is the largest of all animal groups with over 100,000 species The body has a head bearing one pair of antennæ, a thorax of three segments, each bearing a pair of legs, and an abdomen Usually the adult possesses wings Cockroaches, locusts, grasshoppers, earwigs, lice, dragon-flies, aphids, moths, butterflies, beetles, flies, bees, wasps, and ants all belong to this vast group

Arachnida —These are mostly terrestrial, air-breathing forms with no antennæ and four pairs of legs, such as the scorpions, spiders, and mites

Mollusca.—The molluscs are mostly aquatic and differ from the arthropods in having non-segmented bodies with restricted body-cavities The exoskeleton is a shell There are three important groups

Lamellibranchiata —These are the bi-valved shell-fish, such as the mussel, oyster and scallop The head is reduced, and no eyes are present

Gasteropoda —These molluscs are not symmetrical and possess a single shell The head bears eyes and tentacles Included here are the slugs, snails, limpets, and whelks

Cephalopoda —This is a group of highly specialised, free-swimming, marine molluscs which are bilaterally symmetrical There is a definite head containing a brain and bearing a pair of large eyes similar to those of vertebrates Cuttle-fish, the octopus, and the giant squids, which may reach 50 ft in length and are the largest invertebrates known, are included here. The extinct Ammonites, the shells of which are commonly found in many rocks, were also cephalopods

Echinodermata.—These marine invertebrates are all radially symmetrical and have a calcareous skeleton just beneath the surface Included here are the star-fish, sea-urchins, and sea-cucumbers The stalked, sedentary sea-lilies which inhabit the deep oceans are also echinoderms They have a long geological history, and many extinct forms are known

Pisces.—The fishes are all cold-blooded, aquatic, and possess gills by means of which they breathe The body is covered with scales or spines and bears fins for balance and propulsion The cartilaginous fishes, such as sharks, rays, and dogfish, have no bones in the skeleton, the gill-slits are exposed, and the skin is covered with many minute tooth-like spines The much larger group of bony fishes have bony skeletons, the gill-slits are covered by a flap of tissue, and the body is covered with flat, overlapping scales Many fossil fishes are known from as far back as the Silurian period

Amphibia.—These are cold-blooded vertebrates which have to return to water for breeding They show various advances over the fishes Pentadactyl limbs are usually present, and the skull is jointed at its connection with the vertebral column so that the head can be moved The eggs, which are laid in water, have no hard shell and hatch into a larval form with external feathery gills. With rare exceptions a metamorphosis takes place, the larva gradually changing into the adult, which possesses lungs The skin of the adult is usually naked and may be important in assisting respiration The class includes the newts and salamanders, which possess tails, and the frogs and toads, which have no tails in the adult.

Reptilia.—The reptiles were the first vertebrates to become truly land animals. They are cold-blooded but have a more completely bony skeleton and more highly organised blood system than the amphibia The egg contains much food material, which supports the developing embryo, and there is no larval stage The present-day reptiles, snakes, lizards, turtles, tortoises, crocodiles, and alligators are much smaller and far less numerous than those of the Mesozoic

Aves.—The only diagnostic feature of birds is the possession of feathers, although the presence of scales on the legs, the structure of the skull, and the laying of eggs with shells are characters which indicate a reptilian ancestry However, they show many specialised adaptations to the habit of flight The fore-limbs are developed as wings for flapping and gliding, and the skeleton is rigid and light, with air cavities in the bones The body is compact and streamlined and the weight is centralised beneath the wings As there is no bladder and the rectum is short, waste materials are not retained and the weight is thereby further reduced The power necessary for flight requires a high metabolic rate, the maintenance of which is assisted by a large heart with a high rate of beating, a very efficient respiratory system, and a constant body temperature of 38–42° C The 19,000 or more species of birds can be divided into the perching birds, which include many of our song birds, those which scratch for their food, such as the pheasant, the waders, such as the long-legged stork and heron, the swimming birds, which include gulls, ducks, and geese, and finally the large flightless birds, such as the emu and ostrich

Mammalia —The mammals are the dominant land animals of the present time They are warm-blooded and have a glandular skin bearing hairs The body cavity is divided into thorax and abdomen by a muscular diaphragm, the former containing the lungs and heart, which is completely divided into four chambers The red corpuscles of the blood have no nuclei The ear is divided into three regions, the middle ear containing three small bones They all possess mammary glands with which they suckle their young In the largest group of mammals, the *Eutheria*, the young develop within the uterus of the female and are born at an advanced stage In the small group of marsupials of Australia and Central and South America, such as the kangaroos and opossums, the young are born at an early stage and transferred to a pouch round the mammary glands, where they remain for a considerable time There are also two species of monotreme mammals, the duck-billed platypus (*Ornithorhynchus*) and spiny ant-eater (*Echidna*) of Australia, which lay eggs It is impossible in the space available to describe the vast range of eutherian mammals, but the main orders may be briefly referred to as follows

Edentata —The American sloths, ant-eaters, and armadillos, which are mostly insectivorous and have incomplete dentition

Cetacea.—These are the entirely aquatic whales, porpoises, and dolphins, which are fish-like in form and have no hind-limbs.

Ungulata A large group of hoofed mammals, most of which can run quickly on land It includes the herbivorous pigs, sheep, antelopes, deer, camels, and giraffes

Carnivores —These are mostly carnivorous, have keen hearing, sight, and smell, and have sharp teeth and claws for killing and tearing their prey The cats, dogs, bears, hyenas, and also the aquatic seals, sea-lions, and walruses belong to this group.

Rodentia —The rodents are a highly successful world-wide group characterised by the possession of long, sharp, incisor teeth which are used for gnawing. The mouse, rat, squirrel, and rabbit are examples.

Insectivora.—Small, carnivorous, mostly nocturnal mammals, such as the shrews, hedgehogs, and moles.

Cheiroptera.—The bats are truly aerial mammals which have many of the adaptations to flight found in birds. The wings are, however, sheets of skin stretching between the fingers of the fore-limbs.

Primates.—Mainly arboreal, with opposable thumb and big toe for climbing. Nails instead of claws are present at the end of the digits. They have stereoscopic vision, which is important for judging distances when jumping. The brain is well developed. The primates include the small primitive lemurs, monkeys, the anthropoid apes, such as the chimpanzee, and man, *Homo sapiens*.

THE PHYSIOLOGY OF ANIMALS.

Some basic features of the physiology of cells have already been dealt with, and in unicellular animals all life processes, such as respiration, movement, growth, and reproduction, are carried on by one and the same cell. However, in multicellular animals cells are of various types, constituting distinct tissues and organs which perform special functions in the body. Although each living cell has its own complex metabolism under control of its own nucleus, there must also be co-ordination between all cells of an organism for the efficient functioning of the body as a whole. In the space available it is impossible to deal fully with all the physiological aspects of living animals, but an attempt will be made to compare some of the processes in different groups.

Feeding and Digestion.—All animals must take in and digest food materials. As well as water they require complex organic substances, proteins, fats, and carbohydrates, together with small amounts of various salts and vitamins. The insoluble organic substances are obtained from the dead bodies of other animals and plants. These must first be taken into the body and there broken down or digested by enzyme action into simpler, soluble substances. Proteins are broken down to their constituent amino-acids, insoluble carbohydrates to sugars, and fats to fatty acids and glycerine. These soluble substances are then absorbed and distributed to various parts of the body where they are required, or stored for future use. Finally, the unused parts of the food are released from the body.

Diversity of Digestive Systems.—Many animals, called macrophagous feeders, take in relatively large masses of food at intervals of time. Some, such as frogs, fish, and snakes, swallow their food whole, but many break it up first. Most crustacea have appendages with which the food is torn, biting insects have cutting mouth parts, molluscs have rasp-like radulae which are used to scrape off small particles of food, and many mammals break up their food with strong jaws and teeth. In contrast, microphagous feeders collect small food particles continuously and are generally sedentary aquatic animals. They possess cilia which set up water currents from which minute food particles are filtered out, *e.g.*, lamellibranchs. A few animals, *e.g.*, *Lumbricus*, are detritus feeders which take in large quantities of soil or mud. Finally, some take in only soluble food materials. These fluid feeders include internal parasites which absorb dissolved substances over the whole surface of the body, *e.g.*, tape-worms, and insects with sucking mouth parts, *e.g.*, aphids.

Amoeba feeds by flowing around food particles, which are thus digested intra-cellularly. This type of digestion is common in the protozoa and in the amoeboid feeding cells which occur on the inner wall of the body cavity in coelenterates. Most other animals have a gut or alimentary canal in which nearly all digestion takes place extra-cellularly. This canal is basically a tube with the mouth at the anterior end and an anus at the posterior end. Food is taken in through the mouth and forced along by peristaltic action—waves of contraction of the muscles of the gut wall. Generally there is a digesting region, the stomach, and farther along an absorbing region the intestine. In worms the gut is more or less a straight tube, but in higher invertebrates it is more complex, is often coiled or twisted, and possesses diverticula which may have special functions.

In most vertebrates there is an oesophagus or delivery tube between the mouth and the stomach. Birds have an enlarged oesophagus or crop in which the food is stored before it is passed into a two-chambered stomach. The first chamber has a soft glandular wall which secretes digestive enzymes. The second chamber or gizzard has a hard muscular wall and contains stones, and it is here that the food is crushed.

Complex Digestive Systems of Mammals.—The most complex alimentary systems are found in the mammals, although much variation occurs, which can often be related to the type of diet. The carnivors have well-developed canine teeth with which the flesh of the prey is torn, and seals and sea-lions have very sharp teeth which can grip the slippery fish on which these animals feed. Rodents gnaw with their chisel-like incisor teeth, which continue to grow as they are worn away, and herbivorous ungulates have flat grinding teeth, which break up hard plant material. Some whales have no teeth, but, instead, numerous fringed plates of whalebone hang from either side of the palate. Large quantities of water are taken into the open mouth and then forced out again between the plates by the tongue. The plates form a sieve which traps the small organisms called "krill" on which the whale feeds.

In most mammals digestion of starch begins in the mouth under alkaline conditions. When the masticated food reaches the stomach proteins are broken down by enzymes which work under acid conditions. Usually the stomach is a simple curved chamber, but in ruminants such as sheep and cattle it has four chambers. The food is passed down the oesophagus and stored in the paunch. In the second chamber it is rolled into small masses or cuds which are passed up to the mouth and chewed again. When the cuds are swallowed again they enter a third chamber, and from here pass to the fourth chamber, in which the main digestion begins.

From the stomach the food enters the duodenum, in which digestion is completed. Enzymes from the pancreas continue the breakdown of carbohydrates and others digest fats. The simple soluble substances are absorbed through the walls of the long, coiled small intestine, which is richly supplied with blood vessels. In herbivorous rodents, such as the rabbit, there is a large side branch at the end of the small intestine. This is the caecum and appendix in which cellulose is digested. In carnivorous animals and man the caecum and appendix are very reduced and of doubtful function. In the colon water is removed and the waste materials are temporarily stored in the rectum before being eliminated from the body.

Respiration.—Basically respiration involves the absorption of oxygen from the environment and the oxidation of organic substances, such as sugars, resulting in the release of energy and the formation of waste carbon dioxide. All living cells respire and remain alive only if supplied with oxygen. Hence in all animals there must be an efficient respiratory system by which oxygen can be taken up and carbon dioxide released and also a circulatory system by which the oxygen is transported all over the body.

Gaseous Exchange.—In protozoa and most simple aquatic animals gaseous exchange takes place through the whole body surface. Most worms also have no special respiratory organs and are either aquatic or live in very wet surroundings. The entire body surface of *Lumbricus* secretes moisture, and atmospheric oxygen dissolves in this and is then absorbed in solution. Most molluscs are aquatic and possess gills or ctenidia contained in a mantle cavity. The gills are ciliated, and a continuous stream of water passes through the mantle cavity. Although they are primarily

feeding structures, the gills are richly supplied with blood vessels and they take up dissolved oxygen from the water. In terrestrial molluscs, such as slugs and snails, the gills are reduced and the mantle cavity itself acts as a simple lung. The smaller crustacea absorb oxygen all over the body surface, but in most the thoracic appendages bear feathery gills. Continuous water currents are drawn forwards through these, and gaseous exchange takes place. In contrast, most air-breathing insects and arachnids have a system of tracheae, which are branched tubes ramifying throughout the body. They open to the exterior by lateral spiracles, and gaseous exchange takes place in the tracheoles, which terminate the ultimate branches of the tracheae.

Breathing Apparatus of Fish and Amphibia.—The respiratory systems of vertebrates are specialised parts of the anterior region of the gut. Fish have five to seven pairs of lateral gill slits, which in the bony members are covered by an operculum. Water is drawn into the mouth when its floor is lowered. Then the mouth is shut and the floor raised, thus forcing the water through the gill slits. A small group of fish, the *Dipnoi*, have simple lungs which are branches from the lower side of the oesophagus and air is forced into these by the mouth. Many bony fish also have a similar air sac which may be connected to the oesophagus, but this is a hydrostatic organ and is not used in respiration. The aquatic larvae of amphibia have external gills, but the adults usually have lungs. Air is forced into these when the floor of the mouth is raised with the mouth and nostrils shut. The moist, naked skin also allows a certain amount of surface respiration in amphibia.

Complex Breathing Systems.—Respiration is more efficient in the other vertebrate groups, as the volume of the lungs is changed by movement of the ribs, which form a box around the lungs. This is assisted in mammals by the diaphragm, a sheet of muscle which lies beneath the lungs and separates the thorax and abdomen. The lungs are spongy masses of tissue with many small air spaces, and in mammals the internal surface area may be thirty times that of the external surface of the body. The presence of nostrils and a false palate enables the animal to breathe when the mouth is full of food. Associated with the high development of a respiratory system is the formation of a sound-producing organ, the larynx and vocal chords in mammals and the syrinx at the base of the trachea in birds.

Blood Systems.—In the simpler animals there is no blood system, and the dissolved oxygen and nutrients move about the body solely by diffusion, assisted to a certain extent by streaming movements of protoplasm within the cells. Annelids have a well-developed blood system, which consists of dorsal and ventral longitudinal tubes from which capillaries supply the various organs. The blood may be pumped round the system by contractions of the dorsal vessel, but in *Lumbricus* there are five pairs of muscular, contractile "hearts." In some of the burrowing polychaete worms there is a definite two-chambered heart with an auricle into which the blood enters and a pulsating ventricle which pumps the blood round again. The molluscs also have hearts, but these often have two auricles and a single ventricle. The heart in arthropoda consists of the long dorsal blood vessel which forces the blood along arteries. These discharge the blood into sinuses, which are cavities surrounding the various organs. From here the blood collects in the pericardial sinus surrounding the heart. The blood passes back into the heart *via* lateral perforations or ostia. Thus in the arthropoda there are no blood capillaries and the system is described as an "open" one.

Vascular System of Vertebrates.—The vascular system of vertebrates is fairly uniform, the basic pattern being very evident in fishes. They have a heart with a single auricle and a ventricle from which blood is pumped *via* arteries to the gills, where it becomes oxygenated. The blood is collected in the dorsal aorta, from which branches supply all parts of the body. The de-oxygenated blood collects in veins and eventually passes into the auricle again. One vein, the hepatic portal, runs from the intestine to the liver, where it breaks up again into capillaries. It is here that much of the digested food absorbed from the intestine is stored.

The main differences encountered in the other vertebrate groups are related to the presence of lungs instead of gills in the adult. In amphibia there are two auricles, and oxygenated blood returns to the left one from the lungs *via* the pulmonary veins. Oxygenated blood from the skin, together with de-oxygenated blood from the rest of the body, enters the right auricle. The blood passes from both auricles to the ventricle, by which it is pumped into the arterial system and into the pulmonary arteries to the lungs. Thus in the amphibia the separation of arterial and venous blood is incomplete. In most reptiles the ventricle is partly divided by a septum, and the venous blood from the right auricle enters the right side of the ventricle and is pumped to the lungs along the pulmonary arteries. The oxygenated blood from the lungs passes from the left auricle to the left side of the ventricle and thence into the arterial system. In the crocodiles and the warm-blooded birds and mammals the partitioning of the ventricle is complete. All venous blood enters the right auricle and is pumped to the lungs by the right ventricle. The oxygenated blood returns to the left auricle and is forced into the arterial system by the left ventricle. Thus, in these animals with a four-chambered heart there is complete separation of oxygenated and de-oxygenated blood.

Function of the Blood.—The blood itself is responsible for the transport of food materials and oxygen throughout the body. The nutrients are dissolved in the fluid or plasma, but oxygen is actually combined with a carrier in the blood. In most annelids this is red haemoglobin which is dissolved in the plasma, but in some of the burrowing forms it is haemerythrin contained in separate cells, the corpuscles, which are carried along in the blood stream. Crustacea and some molluscs possess blue haemocyanin as an oxygen carrier dissolved in the blood plasma. All vertebrates possess haemoglobin in minute disc-like red corpuscles. The blood also transports other substances about the body, such as hormones secreted by various glands, carbon dioxide to the lungs, and waste nitrogenous materials to the kidneys. Also present in the blood are various types of white corpuscles which are part of the defence mechanism of the body. Some ingest invading bacteria, while others produce antitoxins which counteract the poisonous substances excreted by the bacteria.

Nervous Systems.—All animals are capable of controlling their own bodies and responding to external stimuli. In the worms and higher groups control and response is mainly due to the presence of a nerve system. This consists of many cells or neurons, each of which has a number of short, thin, branched dendrites and a long axon surrounded by sheath cells. The axons may be about 1 mm long or may extend several feet, as some do in large mammals. It is along these that nerve impulses travel. The neurons are grouped together to form nerves, and in some places ganglia or swellings are formed. They may also be massed together to form a definite brain and spinal cord.

The segmented invertebrates usually have a double, ventral, solid nerve cord lying beneath the gut, with a pair of ganglia in each segment. There is also a nerve ring round the oesophagus with a pair of cerebral ganglia above. These may be well developed in some arthropods and constitute a primitive brain. The molluscs also have a ventral nerve cord and a ring with ganglia round the oesophagus. This is particularly well developed in the cephalopods, such as *Sepia*, which has a brain comparable with that of the vertebrates.

Vertebrates.—The central nervous system of vertebrates is a hollow dorsal tube with an anterior brain protected by the skull and a backward exten-

sion, the spinal cord, enclosed in the vertebrae of the spinal column The development of a brain is associated with the formation of a head with sense organs at the front end of the body Masses of neurons form the nerve centres or grey matter of the brain and spinal cord Surrounding and connecting these are millions of nerve fibres constituting the white matter. The cranial and spinal nerves which are given off by the central nervous system are composed entirely of axons Close to the point where a spinal nerve joins the central nervous system the nerve fibres are grouped into two separate bundles or roots The dorsal root contains the sensory fibres, which convey impulses to the brain. The ventral root contains the motor fibres, which convey impulses from the brain to the various muscles, etc The sensory component of the nervous system can be further divided into (a) *somatic*, which conveys impulses from the skin sense organs (exteroceptors) or from the muscles indicating their condition (proprioceptors), and (b) *visceral* which carries impulses from the mucous surfaces of the viscera (interoceptors) Thus the central nervous system receives information about both the internal and external environment of the body. The motor system can also be divided into components (a) *general visceral*, which conveys impulses to the non-striated muscles and glands of the viscera, the blood vessels and iris of the eye. (b) *special visceral*, which supplies the voluntary striated muscles of the jaws, and (c) *general somatic*, which innervates all the other striated muscles of the body

All these ingoing and outgoing impulses are controlled by the central nervous system The simplest type of nervous behaviour occurs in reflex actions If a finger is put on a hot plate an impulse is sent to the spinal cord An impulse is then sent directly *via* a motor nerve to the arm muscles, which move in response, and the finger is rapidly withdrawn from the plate Such an action is involuntary and rigid However, a single sensory fibre makes a large number of connections with other neurons in the spinal cord and brain These may be motor fibres connected to various effectors or neurons which carry impulses to other parts of the central system Further, the neurons of the central nervous system are not rigidly fused, but can make new synaptic connections with each other Thus the combinations between receptors and effectors are limitless, and the brain and spinal cord act as a flexible co-ordinating system

The Brain —The brain itself can be divided into three regions related basically to different sense organs (a) the fore-brain (nose), (b) the mid-brain (eye), and (c) the hind-brain (ear, taste, skin) These primary centres constitute nearly the whole of the brain in fish There is little co-ordination between these and the behaviour of fish is mostly a series of reflex actions without much variation or modification by experience The most important correlation centre in fish is the cerebellum in the roof of the hind-brain, which regulates the posture and movement of the body In birds it is the floor of the fore-brain, the corpus striatum, which is well developed This correlates reactions and movements of instinctive behaviour which are so evident in the complex life routine of many birds. In mammals it is the roof of the fore-brain, the cerebrum, which is so well developed It deals with impulses from the sense organs, which remain separate until final co-ordination The cerebrum judges which of many responses to make to a particular set of impulses Thus arbitration and hesitancy in behaviour are involved. Further, impressions gained from experience are stored or learnt, and the use of this stored experience to decide on the response to a given set of stimuli results in intelligent behaviour The cerebrum is most developed in man, and it has been estimated that there are 10' million neurons in the human cerebral cortex. *See also* **Part IV. Brain Function.**

Reproduction.—A single animal may live for a short or long time, but eventually it dies, and the continuance of the species is dependent upon reproduction Some protozoa, such as *Amoeba*, reproduce asexually by the simple division of the cell to produce two new individuals Asexual reproduction also occurs in some coelenterates, such as jelly-fish, in which there is an alternation of sexual and asexual generations However, the vast majority of animals only reproduce sexually. This involves the fusion of two cells, the gametes, produced by adult individuals, and each zygote thus formed develops into an individual of the next generation The gametes are of two kinds, the large, spherical, immobile ova produced by the female gonad or ovary and the much smaller motile sperms produced by the male gonad or testis The motility of the sperms helps them to reach the passive ovum, which contains food reserves to support the early development of the embryo

Worms —The flat worms, particularly parasitic forms, have complicated life cycles, and many are hermaphrodite, *i e* , each individual has both male and female organs Cross fertilisation usually occurs, the sperms from one worm being introduced into the female duct of another The round worms are unisexual, and internal fertilisation also occurs Of the annelids the polychaete worms are unisexual, but the ova and sperms are shed into the sea, where fertilisation takes place However, *Lumbricus* and the leeches are hermaphrodite, cross-fertilisation takes place and the eggs are laid in cocoons

Crustacea and Insects —Many crustacea are unisexual, though the sedentary barnacles are hermaphrodite Internal fertilisation may occur, but in the crabs and crayfish pairing takes place and the sperms are deposited on the tail of the female When the eggs are shed they become fertilised and remain attached to the abdominal appendages Most crustacea have motile larval stages into which the eggs first develop In *Daphnia*, the water-flea, parthenogenesis sometimes occurs, *i e* , the eggs develop without being fertilised. The sexes are separate in the arachnida and there are usually no larval stages except in the primitive king-crabs The insects are also unisexual, and the fertilised eggs are laid after copulation In some, *e g* ,dragon-flies, an immature nymph similar to the adult is formed, but in flies, beetles, moths, and many others the egg hatches into a larval form This then develops into a pupa, from which the final adult or imago is produced In the social ant's nest the workers are sterile females with large heads, reduced eyes, and no wings The males and queens are winged, and insemination of the latter occurs during the "nuptial" flight

Molluscs and Echinoderms —Most lamellibranchs are unisexual, although some species of scallops and oysters are hermaphrodite There are motile larval forms, and in the swan mussel, *Anodonta*, the larvae develop in the mantle cavity of the parent and when liberated become attached to the gills of fins of fish, where they remain parasitic for some time Some gasteropods are unisexual, but the slugs and snails are hermaphrodite In the latter cross-fertilisation occurs, the two approaching snails being stimulated to copulate by firing small sharp darts of calcium carbonate into each other The echinoderms are unisexual, and fertilisation takes place in the sea The egg first develops into a ciliated larval form

Vertebrates —The sexes are always separate in the vertebrates In some cartilaginous fish, *e g* , dogfish, internal fertilisation occurs and the eggs are laid in protective sacs In contrast, the bony fish shed ova and sperms into the water, where fertilisation takes place Although pairing may take place in the amphibia, fertilisation occurs in water, and there is usually an aquatic larval stage The reptiles, birds, and mammals are independent of water for fertilisation, as copulation takes place and the sperms from the male are introduced directly into the female Most reptiles and all birds lay eggs with hard shells. Development of the embryo in marsupial mammals begins in the female uterus, but is continued in a ventral pouch which surrounds the teat of the mammary gland In the two living species of monotreme mammals the eggs are incubated in a similar pouch Finally, in the eutherian mammals the embryo develops in the female uterus and is born at an advanced stage.

Diversity of Sexual Reproduction — This brief survey will give some idea of the diversity of sexual reproduction in animals External fertilisation is very much a matter of chance, and large numbers of gametes are produced which offset the great losses of gametes and embryos that this method involves Internal fertilisation is more certain, and is also independent of external water—an important factor in land animals In vertebrates particularly there is increase in the care of the young by the parents, involving the development of characters of behaviour as well as those of structure Some fish lay their eggs in holes or nests which are protected by the male Similarly, a few frogs build nests, while others carry the eggs about The eggs of birds require a constant high temperature for their development, and they are usually incubated by the parents After hatching the young are fed and guarded by the parents until they can leave the nest and fend for themselves In the eutherian mammals the embryos are attached to the uterus wall by the placenta, *via* which food materials pass from the mother The period of gestation is long, and after birth the young are supplied with milk from the mother until they are weaned and can feed themselves Another feature in mammals is the period of "childhood" during which they play and learn and are protected and fed by their parents The internal fertilisation, internal development, and care and protection of the young after birth which is so conspicuous in the higher vertebrates results in the reduction of losses during the vulnerable embryonic and young stages, and in consequence relatively few progeny are produced by a pair of individuals

CLASSIFICATION OF PLANTS

There are various ways in which the main classes of the plant kingdom can be grouped, but a simple, up-to-date arrangement is given in the chart Vascular plants are often known as the *Tracheophyta* because they all possess woody conducting elements These are absent in non-vascular plants, and the bacteria, fungi, and algæ are often called *Thallophyta*, *i e*, they have a relatively simple plant body or thallus Many of the bryophytes also possess a thallus, but in some there is a stem bearing leaves, although a true vascular system is absent Many thallophytes are aquatic whereas the tracheophytes are mostly land plants in which the development of woody tissues can be related to the attainment of the land habit as the plant kingdom evolved However, the chart should not be taken as indicating the evolutionary relationships of the various groups It is more a convenient arrangement which reflects the relative complexity of the plant body

Plant Kingdom

- Non-vascular Plants
  - Bacteria
  - Fungi
  - Algae
  - Bryophyta
- Vascular Plants
  - Psilopsida
  - Sphenopsida
  - Lycopsida
  - Pteropsida
    - Filicinae
    - Gymnospermae
    - Angiospermae
      - Monocotyledones
      - Dicotyledones

Bacteria.—This is a vast group of minute organisms of very simple structure They are spherical or rod shaped and may exist as separate cells, some species being motile, or as long chains or irregular masses Their minute size makes the elucidation of their structure very difficult. There is a wall of unknown composition, and cytoplasm which contains glycogen and fat Electron microscope studies have revealed the presence of structures which appear to consist of nuclear material. Multiplication is by simple division, which may take place very rapidly. For example, *Bacillus subtilis* can divide every 20 minutes, so that in 8 hours a single cell may give rise to 16 millions Recent research indicates that a sexual process may also occur. Bacteria can survive unfavourable conditions by producing a resistant spore within the cell. They do not possess chlorophyll, though a few are pigmented Most obtain their food already formed, and are thus either saprophytes or parasites. The saprophytic bacteria occupy a vital position in the living world They are responsible for most of the decay of dead organic matter, and it has been truly said that without them the surface of the earth would soon become completely covered with the dead bodies of animals and plants Bacteria also play a vital part in the circulation of nitrogen in nature By breaking down organic material, ammonia is released and ammonium carbonate is formed in the soil This is oxidised by other bacteria to form nitrates, which can be absorbed by plants again Yet other bacteria can "fix" atmospheric nitrogen, and one species, *Rhizobium leguminosum*, occurs in the root nodules of plants such as clover and lupins These plants are often grown on poor soils and ploughed in, thus improving the fertility of the soil The parasitic bacteria are also of great importance, as they are responsible for many diseases of plants, animals, and man (*See* **P7(1)**)

Fungi.—This is a large group of plants, none of which contain chlorophyll Hence, like the bacteria, they are either parasites on other living plants and animals or saprophytes which live on dead organic matter Some are unicellular aquatic plants, but many have a body called a mycelium composed of many branched threads or hyphæ In the higher fungi (*e g*, toadstools, bracket fungi, and puff-balls) complex reproductive structures are formed All fungi produce spores In the aquatic species these may be motile, but the majority form minute, airborne spores The spore output is often very great, and a single mushroom may produce 1,800 million spores Some fungi are serious diseases of crop plants, such as potato blight and wheat rust

Algæ.—These are essentially aquatic plants which contain chlorophyll They range from microscopic forms to the large seaweeds. The green algæ (*Chlorophyceæ*) live mostly in fresh water and may be unicellular, motile or non-motile, or filamentous, though a few found in tropical seas are more complex The brown algæ (*Phæophyceæ*) are mostly seaweeds which possess a brown pigment, fucoxanthin, which masks the green chlorophyll They include the bladder-wracks (*Fucus*) and kelps (*Laminaria*) of our coasts and the seaweeds which form dense floating masses over hundreds of square miles of the Sargasso Sea Other groups are the red algæ (*Rhodophyceæ*), mostly seaweeds of delicate form, the unicellular motile diatoms (*Bacillariophyceæ*), and the blue-green algæ (*Cyanophyceæ*) All algæ possess unicellular reproductive organs Various types of life cycle occur, the most complex being found in the red algæ.

Bryophyta.—These are the liverworts (*Hepaticæ*) and the mosses (*Musci*). They are all small plants characterised by a sharply defined life-cycle. This consists of an alternation of generations, the "plant" being a gametophyte bearing

sex organs. The latter are multicellular, the female archegonium containing a single stationary ovum and the male antheridium producing many motile sperms. The latter are released and swim in water to the archegonium, where fertilisation takes place. After this a sporophyte is formed which is always dependent on the gametophyte and never becomes free living. The sporophyte usually consists of an absorbing foot buried in the tissue of the gametophyte and a stalk or seta bearing at the top a single sporangium. In many mosses this is a complex structure with hygroscopic teeth which move apart only when dry, thus releasing the minute spores only when conditions are suitable for their dissemination in the air. The bryophytes are of little economic importance, and may be looked upon as an evolutionary sideline. However, they occupy suitable "niches" in many plant communities, and species of the bog-moss *Sphagnum* cover large areas where rainfall is high.

Psilopsida.—This is a small group of primitive, vascular, spore-bearing plants. Its only living representatives are two rare genera of the Southern Hemisphere. However, a number of fossil forms are known from the Devonian period. The best known are those found in the chert at Rhyme in Scotland. The plants are excellently preserved, and their internal structure can be easily seen. They were probably marsh plants with prostrate and erect leafless stems, although *Asteroxylon* had simple leaves.

Sphenopsida.—The only living members of this group are about twenty-five species of horsetails (*Equisetum*). In the Carboniferous period many tree forms existed (*e.g.*, *Calamites*), the remains of which are very common in coal deposits.

Lycopsida.—In the Carboniferous period the tree clubmosses were also prominent members of the forests (*e.g.*, *Lepidodendron*). They often reached 100 ft in height, were branched or unbranched, and had large simple leaves. They also had extensive root systems. The only living members belong to a few genera of small herbaceous clubmosses, such as *Lycopodium* and *Selaginella*. Like the true mosses, they have an alternation of generations, but the elaborate plant with stem, leaves, and roots is the sporophyte, and the gametophyte is very small. In *Lycopodium* only one kind of spore is produced, and the resultant gametophyte is bisexual. *Selaginella* produces numerous small microspores which give rise to the very reduced male gametophytes and motile sperms and the few large megaspores which produce the female gametophytes. The latter are formed within the megaspore wall, which splits to allow the sperms to reach the small archegonia.

Filicinae.—These are the true ferns, which in some classifications are put with the horsetails and clubmosses in the Pteridophyta or vascular cryptogams (*i.e.*, vascular plants without seeds). The ferns have a long fossil history, and remains very similar to the living Royal ferns (*Osmunda*) are known from the Carboniferous. The ferns are widespread and particularly abundant in tropical forests. The majority are herbaceous perennial plants, but a few are aquatic, and there are some tree ferns, which may reach 20 ft in height. Most ferns possess a stem bearing roots and large leaves or fronds. The plant is the sporophyte and produces numerous spores in sporangia borne on the fronds. Each spore gives rise to a minute green free-living gametophyte known as the prothallus, which bears the archegonia and antheridia. After fertilisation a young sporophyte develops, which at first draws nourishment from the prothallus. Thus, as in the *Bryophyta*, external water is essential for the motile sperms to swim in, and there is a clearly defined alternation of generations, but the sporophyte is a complex independent plant, and the gametophyte is reduced though free-living.

Gymnospermae.—These were the dominant land plants in the Mesozoic era, although fossil remains are found as far back as the Devonian. The living members still form large forests in the North Temperate regions. They are mostly tall evergreen trees with roots, stems, and small leaves. The conifers include the pines (*Pinus*), larches (*Larix*), and yews (*Taxus*). The cycads are a relic group of tropical plants with thick, unbranched trunks and large fern-like leaves. The maiden-hair tree of Japan (*Ginkgo biloba*) has also had a long geological history. Another interesting Gymnosperm is *Metasequoia*, a genus well known to palæobotanists. In 1948 a few living specimens were found in a remote area of China. Seeds were collected and plants are now being grown in botanical gardens all over the world. The Gymnosperms are characterised by the production of "naked" seeds, which are usually borne on cones. The male pollen grains which are equivalent to the microspores of *Selaginella*, are carried by wind to the ovule of the female cone. The pollen germinates and the pollen tube carries the male gametes to the reduced archegonia borne on the female prothallus, which, unlike those of the ferns, is retained within the ovule on the parent plant. After fertilisation an embryo is formed, the prothallus becomes the food store or endosperm, and the outer part of the ovule becomes the seed coat. The cycads and *Ginkgo* retain a primitive feature in that the male gametes are motile and they swim to the archegonia from the pollen tube.

Angiospermae.—The apparent sudden rise of the Angiosperms in the Cretaceous period is still the "abominable mystery" it was to Darwin. Various suggestions have been put forward, but nothing definite is known about the origin of the group. The Angiosperms or flowering plants are now the dominant group over most of the land surface of the earth, and at least 250,000 species are known. Apart from the natural vegetation the majority of our crop and garden plants are Angiosperms. They occur in every type of habitat and range in form from gigantic trees to minute plants, such as the duck-weeds. Some are climbers, others succulents, and a number have reverted to the aquatic habit. Although most possess chlorophyll, a few are partial (*e.g.*, Mistletoe) or complete parasites (*e.g.*, Dodder).

Flower, Fruit and Seeds.—The diagnostic feature of the group is the production of seeds, which are completely enclosed within the female part of the flower, the ovary. Basically a flower is a short reproductive shoot which bears several whorls of lateral organs. At the base are several, often green, protective sepals forming the calyx, and above this are the often brightly coloured petals of the corolla. Within this are the stamens of the androecium or male part of the flower. Centrally is the female gynœcium of one or more carpels containing the ovules. The parts of the flower may be free, as in the buttercup, or fused together. In many species the petals are fused (sympetalous), the stamens are borne on the corolla (epipetalous), and the carpels are fused to form a compound gynœcium (syncarpous). The stamens possess anthers, which produce pollen grains. These are shed and carried by insects or wind to the receptive stigmas of the carpels. Each produces a tube which grows down the style to the ovary and enters an ovule. The ovule is a complex structure containing an ovum and a primary endosperm nucleus. Two male nuclei are discharged from the pollen tube, one fuses with the ovum and the other fuses with the primary endosperm nucleus. After this "double fertilisation" an embryo is formed which is embedded in the nutritive endosperm and the outer tissues of the ovule form the seed coat or testa. The ovary of the carpel develops into the fruit containing the seeds. Fruits are of various kinds, being either dehiscent and opening when mature to release the seeds or indehiscent, with a succulent or dry wall. The indehiscent fruits are shed as a whole, and often contain only a single seed. Seeds and fruits show great variation in structure, and often have adaptations assisting dispersal. Some have hairs or wings which aid wind dispersal, whereas others have hooks or are sticky and are transported by animals. Some have flotation devices and may be carried a great distance from the parent plant by water. Seeds vary in size from the microscopic seeds of orchids to those of the double

coconut, which may weigh 40 lb. Only about 10% of the weight of a seed is water, and the embryo, although alive, is dormant The bulk of a seed consists of stored food material, commonly fats or starch and proteins, which may be contained in the endosperm surrounding the embryo, although in some species the endosperm is absorbed during seed development and the food is stored in the one or two swollen seed leaves or cotyledons of the embryo.

Classification of Flowering Plants — John Ray (1627–1705) was the first botanist to recognise the two great divisions of the Angiosperms—the dicotyledons with two seed leaves and the monocotyledons with only one This primary division of the flowering plants has stood the test of time and is still recognised Other differences are also found between the two groups The dicotyledons usually have net-veined leaves and the floral parts are in fours or fives, whereas the monocotyledons usually have leaves with parallel veins and the floral parts are in threes

THE PHYSIOLOGY OF SEED PLANTS.

When a dormant seed is planted it takes up water and dissolved oxygen from the soil and germinates Early growth is dependent on the food reserves present in the seed, but when these are exhausted the young plant becomes self-supporting The root hairs absorb water and simple inorganic compounds of nitrogen, phosphorus, potassium, calcium, magnesium, sulphur, and iron These, together with certain trace elements, such as boron and manganese, are essential for healthy growth The water passes up the woody tissues of the root and shoot, and a great deal is lost by evaporation through the stomatal pores present in the leaf surfaces In most plants the stomata are only open during the day, and it is through these that gaseous exchange also takes place Oxygen is taken up from the atmosphere and carbon dioxide is given out due to respiration

Photosynthesis.—In the overall process of photosynthesis carbon dioxide is taken up by the plant and oxygen given out The living cells of all green parts of plants, particularly of leaves, contain chloroplasts, which are discoid bodies 2–20 microns across Their structure is complicated, and they contain two green pigments, the closely related chlorophylls a and b, together with yellow xanthophylls and orange-yellow carotenes The chlorophylls are responsible for absorbing light energy from the sun, mostly in the red and blue regions of the spectrum This energy is ultimately used in the formation of organic compounds from the carbon dioxide and water which the plant obtains from its environment Thus green plants are almost unique in the living world in being able to synthesise organic compounds from these simple substances, and it is upon this process that all life ultimately depends Due to its fundamental importance, both to the living world and to man's food production, the secrets of this process are being actively studied by many research workers all over the world By using radioactive isotopes it has been shown that the energy absorbed by chlorophyll is involved in the photolysis or splitting of water molecules Some of the hydrogen from the water combines with carbon dioxide and oxygen is released from the plant One of the first compounds formed appears to be phosphoglyceric acid This substance occupies a central position in plant metabolism It is an intermediate compound in the formation and breakdown of sugars, and it is easily converted into other substances from which fats and proteins are synthesised Undoubtedly photosynthesis takes place in a number of steps, and a full understanding of the process has still to be reached. It cannot yet be fully demonstrated *in vitro*, but a recent advance has been made by American and German workers, who have synthesised chlorophyll in the laboratory.

Reaction to Environment.—Like all organisms, plants react to their environment in many ways They exhibit many growth movements or tropisms. For example, stems are commonly positively phototropic and grow towards light, and they are also negatively geotropic and grow away from the centre of gravity Many roots are positively geotropic and also positively hydrotropic and grow towards water Some plant organs also exhibit nastic movements and can assume various positions Thus many flowers and leaves open out during the day and close at night.

THE GEOLOGICAL RECORD.

London is an old city as cities go, although not so old as Rome, but geologically speaking it is not so long since the land upon which London stands was beneath the sea Later in time there were tropical jungles on the banks of the Thames in which sabre-toothed tigers hunted their prey, the Thames was a tributary of the Rhine, and, still more recently (in fact only yesterday on the cosmic time-scale), the great Ice Ages brought sub-arctic conditions to our land

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify, and it is in these rocks, too, that the record of life upon earth may be traced

No Life Rocks.—The earliest rocks in the record are known as the Azoic (no life) rocks, because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record That is to say, for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or sand, swept by hot winds exceeding in violence the wildest tornadoes of today, and drenched by torrential downpours of tropical rain, which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1,500 million years ago

Primitive Sea-life.—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age), when we find the fossilised remains of small shellfish seaweeds, and trilobites—the latter were creatures somewhat like the plant-lice of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas; for as yet life had not invaded either the dry land or the deep oceans. It is, of course, clear that these creatures of Early Paleozoic times were not the first living things they were merely the first creatures capable of leaving fossilised remains, and without doubt must have had more primitive ancestors—amœbic-like forms, jellyfish, bacteria, and so on whose bodies were too soft to leave any traces in the record of the rocks This problem, however, will be discussed more fully later

The Age of Fishes.—Towards the end of the Early Paleozoic Era, in what we now know as the Silurian period (see F30), there arose a new form of life the first backboned animals, primitive fishes somewhat similar to the sharks of today; and in the division of the Upper Paleozoic Era known as the Devonian, they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants.—It is about this time, too, that we begin to find traces of animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live out of water, for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the

evolution of an impermeable outer cuticle which prevented water loss and also the development of woody tissues which provided support and a water-conducting system for the whole plant body

Amphibia and Spore-bearing Trees.—The first type of vertebrates (backboned animals) to live upon dry land was the group of amphibia in the Carboniferous Age, which is today represented by the newts, frogs, toads, and salamanders In all these forms the eggs give rise to a tadpole stage with gills which lives for some time entirely in water. Later the gills give place to a primitive form of lung which enables the animal to live upon land. Even so, amphibia are restricted more or less to swampy or marshy land, and without a damp environment they would dry up and shrivel to death. The most abundant forms of plant life in the Carboniferous period were the tree-like horsetails, clubmosses, and ferns, the fossilised tissues of which are found in the coal measures and are burned as household coal But these plants also, as in the case of the amphibia, could exist only amongst the swamps and marshes, and life, although it had freed itself from the necessity of existence in the waters of the earth, still had to return to the water in order to reproduce itself The highlands and the deeper waters of the planet were still empty of living things. Although the Carboniferous period had been a period of warmth and abundance, the Paleozoic Era came to an end with a long cycle of dry and bitterly cold ages Such long-term climatic changes were due, it is now supposed, to such factors as changes in the earth's orbit, the shifting of its axis of rotation, changes in the shape of the land masses, and so on Long before the Ice Ages of more recent times, there are records in the rocks of alternating periods of warmth and cold as far back as the Azoic and Early Paleozoic Eras This long cold spell at the close of the Paleozoic era came to an end about 200 million years ago, and was succeeded by a long era of widely spread warm conditions—the Mesozoic Era, the so-called Age of Reptiles

The Mesozoic Era.—The reptiles first appeared in the Permian, but it was during the Mesozoic era that they became the dominant group of animals The giant reptiles included the stegosaurus, the gigantosaurus, the diplodocus, and many other kinds which were far larger than any land animals living today. Some, for example the diplodocus, were 100 ft. long, although they were vegetarian in habit and were preyed upon by other almost equally huge flesh-eating reptiles Some species, such as the plesiosaurs and icthyosaurs, became secondarily aquatic, while the pterodactyl possessed wings with which it could glide and perhaps fly short distances However, they all differed from the amphibia in that they had hard, dry skins, their lungs were more efficient, fertilisation was internal due to the development of copulatory organs, and they laid eggs with hard, protective shells

It was also during the Mesozoic era that the warm-blooded birds and mammals arose from reptilian ancestors The birds, like the reptiles, lay eggs with hard shells, and they have several internal features found in the reptiles The fossil bird Archaeopteryx, three specimens of which have been found in Germany, lived in the Jurassic period Although it was obviously a bird, it retained many reptilian features The fossil Trituberculata, which are also found in the Jurassic, are believed to be the fore-runners of the true mammals Although insects were present as far back as the Ordovician, it was in the Mesozoic that many of the groups we know today first appeared

Great changes also took place in the plant cover of the land during this era The spore-bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these, the cycadeoids, has become extinct, but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance, and towards the end of the Cretaceous their evolution was extremely rapid In fact, many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present-day flowering plants

A New Era—But, perhaps 150 million years later, all this seemingly everlasting warmth and sunshine, the lush tropical life, the giant reptiles who had ruled the world, were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Caenozoic was beginning, ushered in by a period of upheaval and volcanic activity, following which the map of the world came to resemble more closely the picture we know today The cold period may have lasted several million years, and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era, the seed-bearing flowering plants, the birds, and the mammals. The once all-powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today: the snakes, lizards, crocodiles, and alligators It was at this

THE GEOLOGICAL TIME SCALE.

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		Birds, Mammals and modern plants Molluscs
	Miocene	25	
	Oligocene		
	Eocene	70	
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads, Earliest Birds, Ammonites and Sea-urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals, Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insects
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals, no life on land Trilobites and graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		2,000	Life emerges
		5,300	Age of Earth's crust

time, too, that, long after the creation of the mountains of Scotland and Norway (the so-called Caledonian revolution), or even of the Appalachian mountains (the Appalachian revolution), there arose the great masses of the Alps, the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent, the Caenozoic revolution. Initially, as we have seen, the climate of the Caenozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached, only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

The Great Ice Age.—The latter was separated by interglacial periods when the climate was milder—we are, in fact, living at the moment at the end of the last Ice Age, for the retreat of ice from Europe began only about 25,000 years ago. It must be remembered, however, that even at the height of the Glacial periods the ice never extended over the whole face of the earth; it was, indeed, limited to an area which never moved farther south than what is now Northern Germany, Northern France, the larger part of the British Isles, small areas in the North of Asia, and about half of the North American continent.

THE EVOLUTION OF ORGANISMS.

Introduction.—It is commonly thought that the great 19th cent. naturalist Charles Darwin was the first person to suggest that life had continually evolved. However, the idea that species of living organisms could change over long periods of time was considered by some Greek writers and, much later, by the Frenchmen Buffon and Lamarck at the end of the 18th cent. Further, the work of the 18th cent. geologists such as James Hutton and William Smith provided a basis without which Darwin's contribution would have been impossible. Hutton showed that the earth's surface had undergone prolonged upheavals owing to changes in sea level and volcanic eruptions and this implied that the earth was much older than had previously been supposed. Smith developed a method of dating the geological strata by means of the fossils found in them and demonstrated that widely different types of animals and plants existed at different periods of the earth's history. As described in the previous section a general picture is presented of the evolution of organisms from the simple to the complex and from the aquatic to the terrestrial environment. These discoveries were in conflict with the Biblical account in the book of Genesis and, although various attempts were made to explain them away or discount them, it became abundantly clear that through millions of years life has been continually changing, with new species constantly arising and many dying out. Before considering Darwin's major contribution to the theory of evolution it will be appropriate to outline briefly the various lines of evidence which indicate that, in fact, evolution has taken place.

The Evidence for Evolution.—

1. *The Geological Record.*—It has already been pointed out that successively younger rocks contain fossil remains of different and relatively more complex organisms. The spore-bearing plants preceded the gymnosperms and the angiosperms arose much later. Similarly in the vertebrate series the fish appeared before the amphibia which were followed by the reptiles and later by the air breathing, warm-blooded birds and mammals. On a more restricted level the rocks provide even greater support for the occurrence of evolution. For example, the evolution of the horse has been worked out in great detail from the small Eohippus which was about a foot high and had four digits on the forefeet and three on the hind feet to the large one-toed animal living today. However, such complete series are rare and the geological record is very incomplete. There are a number of gaps, particularly between the major groups of organisms. No satisfactory fossil evidence is known of the ancestors of the angiosperms (**F28(2)**) and although some may be discovered it could be that they did not grow in conditions which favoured their preservation as fossils. On the other hand, Archæopteryx (**F30(2)**) provides an indisputable link between the reptiles and the birds.

Another important point should also be made about the geological record. Although we talk about the age of fishes, the age of reptiles and so on it must be emphasised that these are the periods during which particular groups were abundant or even dominant. Each group probably originated many millions of years before it became widespread. Further, some groups, such as the giant reptiles and the seed-ferns, died out completely whereas others, the fishes and true ferns for example, are still common today. However, even in the latter groups there is evidence that they have continued to evolve so that many fishes and ferns that exist today are very different from those of the Devonian and Carboniferous periods (**F30**). On the other hand, the geological record also shows that some species, for example the Maiden-hair tree, have remained unaltered for many millions of years.

2. *Geographical Distribution.*—Nearly all the marsupials or pouched mammals are found only in the Australian continent which was cut off from the mainland about 60 million years ago. All the fossil evidence indicates that at that time the eutherian or placental mammals did not yet exist. The marsupials are the only naturally occurring mammals in Australia but since the isolation of the continent the group has given rise to a large number of species very similar in appearance to those which evolved elsewhere in the world among the eutherian mammals (**F23(2)**). There are marsupials which look like wolves, dogs, cats and squirrels, yet they have no close biological relationships to these animals. Further, some marsupials such as the kangaroos have evolved which are unlike any other creatures in the rest of the world. Quite clearly the isolation of Australia so long ago has resulted in the evolution of these distinct types. A similar small-scale effect of isolation was studied by Darwin in the Galapagos islands where each has its own distinct flora and fauna which differ also from those of the S. American mainland.

3. *Anatomy.*—The comparative study of the development and mature structure of the mammalian body provides much evidence that all the species have evolved from a single ancestral stock. Although the arm of an ape, the leg of a dog, the flipper of a whale and the wing of a bat appear very different externally they are all built on the same skeletal plan. It would be difficult to explain such similarities unless they had all evolved from a common type. There is also evidence that the early development of an animal recapitulates its biological history to a certain extent. For example, the gill slits found in fish are formed during the early stages in the development of a mammal although later they disappear. Finally, apparently useless vestigial structures sometimes occur which would be inexplicable unless regarded in the light of an evolutionary history. In man a small appendix and vestiges of a third eyelid occur but these are functionless although in other animals such structures are well developed and functional, *e.g.*, the appendix in the rabbit.

4. *Human Selection.*—During his brief history on earth modern man has continually selected and bred animals and plants for his own use. We have only to look at the various breeds of dogs which have been developed from a single wild type to see that under certain circumstances great structural divergence can occur in a species even in a relatively short time.

The Darwinian Theory of Evolution.—Darwin amassed a great deal of information such as that outlined above which convinced him that evolution of life had taken place over millions of years. His was the first real attempt to collect all the evidence scientifically and no other satisfactory alternative explanation of all the facts he presented has been proposed. Perhaps even more important was his attempt to explain *how* evolution had actually occurred. He published his theory after many years of work in his book *The Origin of Species by Means of Natural Selection* in 1859. Some of his ideas have since been modified owing to our increased knowledge of genetics but they are so important that it is worth while recounting the main points of his theory.

1. *The Struggle for Existence.*—It is clear that in nature there is a severe struggle for existence in all animals and plants Over a period of time the number of individuals of a species in a given community does not vary greatly. This implies that the number of progeny which survive to become mature breeding individuals more or less replaces the number of mature ones that die Generally speaking the reproductive output of a species is much greater than this For example, a single large foxglove plant may produce half a million seeds each one of which is potentially capable of giving rise to a new individual Obviously nearly all the progeny die before reaching maturity and the chance of any single one surviving is very remote

2 *Variation.*—The individuals of any generation of human beings obviously differ from one another and such differences are found in other organisms No two animals of the same species (except perhaps for identical twins) are exactly alike and when a large number of individuals are examined it is clear that they vary considerably in structure, colour, activity and so on Darwin also pointed out that generally these variations were passed on from one generation to the next, for example, the children of tall parents tend to grow tall

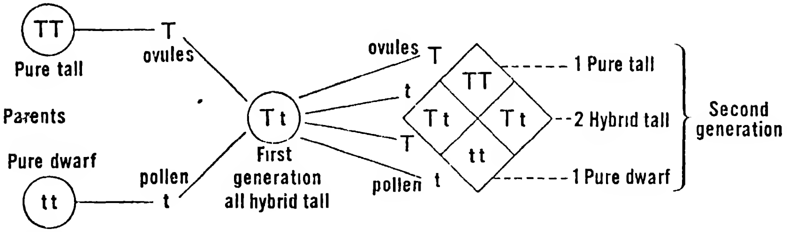
3 *Survival of the Fittest*—If there is an intense struggle for existence in their natural environment among individuals of a species having different characteristics, those which are best "fitted" to a given set of conditions are most likely to survive to maturity. These will reproduce and the features which enabled them to survive will be passed on to their offspring This process is liable to continue and a species will become better adapted to its environment

4 *Natural Selection*—Over a long period of time the environment of a given species is never stable but will change in various ways As it does so the characters which best fit the individuals to the changed environment will be selected (not consciously of course) and the species will change The environment may change only in part of the range of the species and thus lead to divergence and the production of a new species alongside the old one

Darwin and Lamarck.—Darwin pictured evolution as a slow continuous process with natural selection operating on the small inheritable variations found between the individuals of a species which are undergoing intense competition This neglects the important effect of the environment on the growth and structure of the individual It is obvious that external conditions will affect the development of an organism, for example the effect of various soil conditions on the growth of a plant or the amount of food material available to an animal Lamarck maintained that the characters acquired by an individual owing to the effect of its environment could be passed on to its offspring Undoubtedly characters are acquired by the individual during its growth but in spite of many attempts to prove otherwise no experiments have been done which prove conclusively that these are inherited by the offspring. Thus Lamarck's theory that evolution has occurred by the inheritance of acquired characters is not generally acceptable today.

Mutation Theory.—The data accumulated by Darwin showed that the variations between individuals of a species are small and graded into one another If a particular character in a group of individuals is measured it is found that it varies symmetrically about a mean or average, with most values clustered about the mean and with few extreme ones Darwin himself was worried about this fact because, although selection over a long period of time might shift the position of the mean, he did not see how it could bring about the discontinuity necessary for the establishment of a distinct new species De Vries in his *Mutation Theory* published in 1901 put forward the view that evolution depends, not on the accumulation of continuous minute variations, but primarily upon large discontinuous variations or mutations The importance of such spontaneous "sports" was considered by Darwin but he rejected the idea because when they appear they are usually "monstrous" Such individuals are less "fitted" to their environment and therefore they will not survive to reproduce and give rise to a new species That mutations are important factors in evolution is undoubtedly true but modern work has shown that the whole problem is far more complex than either Darwin or De Vries supposed

Mendelism.—It is remarkable that in spite of carrying out many careful experiments on inheritance in plants Darwin did not discover the simple laws which are the basis of modern genetics Mendel investigated inheritance in the garden pea and published his results in 1865, *i e*, at the time that Darwin's work was being widely discussed However, Mendel's important discoveries were not generally known until 1900 When he crossed a pure breeding tall plant with a pure breeding dwarf plant all the progeny were tall When these plants were self-pollinated the next generation consisted of approximately one quarter dwarf plants and three quarters tall From this and similar experiments Mendel deduced that the "factors" passed from parents to offspring were paired, only one of the pair came from each parent and that one could be dominant over the other When he dealt with two pairs of characters, *e g*, tall or dwarf plants and round or wrinkled seeds he found that they segregated and recombined independently and in predictable ratios



The importance of Mendel's work in relation to evolution is that it showed that there was no blending of the characters in the offspring Mutations can be hidden as recessive characters in a population and are not diluted or lost Although they may not be of importance when they first appear they may be so if the selection pressure changes and they become of survival value Thus specific characters may change or diverge and evolution will take place. His investigations also showed that recombination of factors could give rise to plants with new characteristics By crossing a pure bred tall plant having round seeds with a dwarf plant having wrinkled seeds he produced in the second generation some tall plants with wrinkled seeds and dwarf plants with round seeds When a large number of characters are involved it is obvious that considerable variation and recombination occurs upon which natural selection can work.

Mendel was fortunate in his choice of experimental material with its easily recognisable contrasting characters It is now known that his "factors" are the genes carried by the chromosomes in the nucleus of the cell At the present time the biochemical basis of heredity is being vigorously investigated. (*See* **Part IV: The Genetic Code**).

THE ORIGIN OF LIFE.

We have seen in the previous two sections that life has existed on earth for many millions of years and that it has continuously changed or evolved. This raises the obvious question of the origin of life on earth. There are three possible explanations (a) that it was supernaturally created; (b) that living organisms arrived from some other part of the universe, or (c) that it arose by natural processes from inorganic matter. The first explanation is not strictly scientific, i e, it does not elucidate observations in terms of natural laws The second possibility, if true, only pushes the problem one stage farther back It would also require an explanation of how living organisms could survive the hazardous journey through space There remains the third suggestion that life arose on the earth at an early stage in its long history This view is accepted by most scientists today, and N W Pirie has proposed the convenient term *biopoesis* (life-making) for the origin of life. The approaches to the problem so far have been mainly speculative, but the increasing attention which it has been given in recent years culminated in a conference on the Origin of Life held in Moscow in 1957 by the International Union of Biochemists

Chemical Conditions before Life appeared.—The earliest fossil remains found in the rocks are of relatively complex organisms Undoubtedly life first appeared much earlier than the time when these organisms existed, and in a much simpler form. J. D Bernal has pointed out that biopoesis involved development from the simple to the complex and that Darwin's concept of evolution has to be projected backwards to include the chemical evolution of non-living and pre-vital substances. All living things are built up from organic compounds which contain the element carbon These compounds are extremely complex, and a single molecule of a protein may contain many hundreds of atoms Proteins, which are the structural basis of protoplasm, consist of many simpler amino-acids linked together Thus, before considering the formation of the complex organic compounds found in living organisms, the formation of the simplest organic substances, such as hydrocarbons, must be dealt with. Presumably at an early stage in the earth's history there were land masses, seas and rivers, an atmosphere, but no life or complex organic compounds It seems likely that the atmosphere consisted of a mixture of nitrogen, carbon dioxide, hydrogen, ammonia, and methane, but probably no oxygen was present Therefore the conditions on earth when life first arose were probably very different from those today, and A Oparin and J. B S. Haldane have concluded that these favoured the formation of energy-giving organic molecules Recent experiments in Russia and America have shown that if mixtures of the gases mentioned above are exposed to electrical discharges or ultra-violet light many organic molecules are formed, including those of amino-acids This suggests a way in which simple organic compounds may first have been formed on earth, as its atmosphere would have been exposed to both electrical discharges (lightning) and ultra-violet light (from the sun)

From Simple to Complex Molecules—A further step would involve the formation of sub-vital systems which, using this energy, could grow, split, and reproduce themselves Haldane has suggested that these may have been complex phosphates, but J W S Pringle believes that they were oxidised hydrocarbons The maintenance of these sub-vital systems poses two problems, their protection from the turbulence of their environment and an adequate concentration of their constituents. According to Pringle, they existed in the depths of the oceans, but Haldane suggests they occurred in water-logged soils Bernal considers they may have been adsorbed on to certain clays along shores and estuaries where the clay minerals might also have acted as inorganic chemical catalysts and promoted the building of larger molecules Pirie has made the important point that probably many sub-vital systems were formed over a long period of time and that life on earth today represents only one or a few of the most successful.

The Need for More Research.—Another crucial step would be the development of a cell membrane which would contain and protect the system within but which would allow the interchange of substances between the system and the environment No useful hypothesis has been suggested for this although Haldane has put forward the view that this was a highly improbable event which occurred once to form the first cell.

Obviously we are far from having an answer to this intriguing problem, which has become of even greater importance with the beginning of space exploration and the possibility of finding life on other planets It is one which can be fully answered only by the joint efforts of scientists of many disciplines, astronomers, biologists, chemists, and physicists.

III. THE ORIGINS OF HUMAN SOCIETY

THE EARLIEST MEN.

Before describing the earliest men, it is important to try and define just what is meant by "Man" Man is a member of the Order of Primates and of the Sub-Order Anthropoidea, which includes also apes and monkeys Both Man and the apes belong to the Super-Family Hominoidea, which is subdivided into two Families the Pongidae or anthropoid apes, and the Hominidae, which includes all extinct and modern forms of Man The most important anatomical difference between the two Families is that hominids walk upright, whereas pongids are dependent also on their arms for locomotion.

The common ancestral stock of these two Families is represented by such fossil forms as *Proconsul* from East Africa, which lived during the Miocene period about 20 million years ago, and by *Oreopithecus* from Italy, dating from the Lower Pliocene of about 10 million years ago Both these early apes show certain characteristics of the "hominid" line which are not found in the great apes of today The modern apes have specialised for life in the trees, but some of their ancestors must have left the forests and taken to life on the open plains. In this new environment, the arms no longer had to be used for swinging from tree to tree and gradually the pelvic girdle and lower limbs became adapted to an erect posture This development had far-reaching effects It meant that the hands were now free for tool-using and tool-making

The Australopithecines.—The earliest known hominids are the Australopithecines of E. and S Africa which lived over a million years ago, during the later part of the Lower Pleistocene They are so ape-like in appearance that for many years scientists disputed that they were hominids rather than pongids But, although they cannot be regarded as "men" in the sense that we speak of all members of the genus *Homo* as men, the shape of their pelvis and limb bones makes it certain that they had adopted the erect posture, and for this reason they are classified as hominids.

The first *Australopithecus*—a name which means "southern ape"—was found in 1924 at Taung, Bechuanaland, by Professor R Dart; it was the skull of a child, and therefore its true position in the evolutionary scheme could not be assessed with certainty From 1936 onwards, however, adult remains of similar creatures were found by the late Dr. R. Broom in the limestone caves of the Transvaal. These fossils were given various names, but it is now generally agreed that they are all members of one genus. Probably two species are represented, one is small and unspecialised, the other larger and more like the

modern gorilla. Both had small brains, but when their size is taken into consideration the brain is relatively larger than that of modern apes

Occasional finds of crude stone tools in the South African caves suggested that the Australopithecines might have been tool-makers This view was strongly supported by a discovery in East Africa in 1959 In the lowest bed of Olduvai Gorge, Tanganyika, Dr and Mrs Leakey found a skull which they named *Zinjanthropus*, but which is very similar to the more ape-like of the two Australopithecine species known in South Africa In 1961, *Zinjanthropus* was dated by the potassium-argon method to about 1,700,000 years He has a huge palate with enormous molars, hence his popular name " Nutcracker Man " He was found associated with flakes from the manufacture of pebble-tools, which are found elsewhere in Bed I at Olduvai in abundance

This "pebble culture," consisting of river pebbles flaked at one end to form a cutting edge, is known from many parts of Africa It is the first stage of the Palaeolithic or Old Stone Age, which persisted from about half a million years ago until the end of the Ice Age about 8000 B C.

Pithecanthropus.—The second stage in the evolution of the hominids is represented by *Pithecanthropus*, a form which seems to be intermediate between *Australopithecus* and *Homo* His remains have been found in Java, China, and North Africa, in deposits dating from the Middle Pleistocene perhaps about 400,000 years ago The brain was considerably larger than it had been during the Australopithecine stage, but it was still very small compared with that of modern man The skull is extremely thick, the forehead low and sloping, the brow-ridges very heavy, and the chin region receding The first skull of *Pithecanthropus erectus*—" erect ape-man " —was found as long ago as 1891 at Trinil, Java, by Dr E Dubois Other specimens were discovered by Dr G H R. von Koenigswald during the 1930s, including a rather earlier form named *P robustus* and a massive jaw of *Meganthropus* which probably represents the Australopithecine stage in Java

The first remains of Pekin Man from the cave of Chou Kou Tien near Pekin were discovered in 1927 and 1929 Named *Sinanthropus pekinensis*, these specimens are now accepted as being a species of *Pithecanthropus* A sad fate befell the original material it was all lost in American hands during the war as it was being evacuated from China There are casts of the originals, however, and two more pieces of mandible were found in 1959 Pekin Man was accompanied by crude tools of stone and bone, and hearths show that he could make fire Large accumulations of bone prove that he was a skilful hunter, and human skulls smashed to extract the marrow indicate that he was also a cannibal

The only certain representatives of *Pithecanthropus* outside Asia consist of jaws found in Algeria and Morocco in 1954-5 They were named *Atlanthropus*, but are almost identical with jaws of Pekin Man They were accompanied by hand-axes, pear-shaped tools which persisted with very little change from the end of the pebble-culture for about 200,000 years An important discovery was made at Olduvai, Tanganyika, in 1960, it is a skull-cap transitional between *Pithecanthropus* and *Homo* and was associated with hand-axes It has been dated by the potassium-argon method to about 350,000 years

Early Representatives of Homo—After the second or *Pithecanthropus* stage, the first representatives of *Homo*—the only hominid genus which still survives today—began to appear First must be mentioned an isolated and controversial jaw found at Mauer, near Heidelberg in Germany in 1907. It is extremely massive and has a number of unique features which distinguish it from *Pithecanthropus*, though whether it should be regarded as a member of this genus or the earliest *Homo* cannot be assessed unless parts of the skull should be found It is thought to be roughly contemporary with Pekin Man, and is the earliest human remains known from Europe

The Heidelberg jaw dates from the second of the four glacial advances which followed one another during the Pleistocene period In northern Europe and North America deposits from these successive glacials and interglacials provide a means of dating fossils and implements found in them Two human skulls dating from the Second or Great Interglacial, about 250,000 years ago, are known from Europe: from Steinheim in Germany and from Swanscombe in Kent These are roughly contemporary with the last survivors of *Pithecanthropus* in North Africa Like the latter, Swanscombe Man was associated with hand-axes

In the Steinheim brain-case we have, for the first time, proportions not very much smaller than those of modern man The forehead, however, is sloping and there are well-marked brow-ridges Probably both the Steinheim skull and the fragmentary Swanscombe remains are intermediate in form between modern man and the Neandertal people

The Neandertaloids.—During the early part of the Fourth Glaciation, in Upper Pleistocene times, the Neandertal race occupied parts of Europe, western and central Asia, and North Africa At the same time rather similar people lived in southern Africa (Rhodesian Man) and Java (Solo Man) In Europe the Neandertalers lived in caves to protect themselves from the cold They also buried their dead in caves, with the result that many of their skeletons have been preserved The first Neandertal remains were found before the end of the last century, in the Neander valley in Germany, as well as in Gibraltar, Belgium, and Jugoslavia Then many others were discovered in France, and now they are known also from central Siberia and from Cyrenaica in North Africa

The so-called " classic " Neandertalers had a rather brutal appearance, with heavy brow-ridges, sloping foreheads, and receding chins At Mount Carmel in Palestine these exaggerated forms were found in the Tabun cave, while close by, at Skhul, were others with features far nearer to the men of today This may be a case of individual variation within a group, or it may mean that Neandertalers interbred with people of modern type to produce hybrids.

Rhodesian Man, though clearly not a Neandertaler, has many distinctive features which distinguish him from modern man, particularly the enormous brow ridges which form a continuous bar above the eye sockets The first skull of this type was found in 1921 at Broken Hill in Northern Rhodesia, in 1951, a very similar skull was discovered near Saldanha Bay in Cape Province The associated fauna and stone tools make it probable that these human remains date from the early part of the Upper Pleistocene, not more than 70,000 years ago and perhaps less Contemporary and rather similar in appearance is Solo Man from Java, probably a direct descendant of *Pithecanthropus*, whose remains were found a few miles away.

Homo Sapiens.—Events during the Fourth or Last Glaciation can be dated fairly exactly by the radiocarbon method, which, by means of new techniques, can now provide absolute dates over the past 50,000 years Such dates have supported chronologies previously obtained by studying the geological deposits, which indicate three main cold phases separated by milder periods Neandertal Man became extinct soon after the first cold phase ended about 40,000 B C and was replaced by *Homo sapiens* of completely modern appearance by the beginning of the second cold phase about 30,000 B C

Neandertal Man's stone tools were made on flakes, they consisted of points and other weapons which were probably hafted as spears The implements made by the men who succeeded him show significant advances, they include small knife-blades and engraving tools, specialised for different purposes It was during this Upper Palaeolithic stage that Man began to concern himself with something more than merely hunting and searching for food. He produced very fine paintings and sculpture, adorned himself with necklaces and other ornaments, and apparently practised magic rites and ceremonies.

Europe.—The earliest known skull of completely modern type comes from Combe Capelle in south central France and was associated with an industry which represents the first stage of the Upper Palaeolithic of western Europe. The somewhat later Cro-Magnon people, named from a rock shelter at Les Eyzies in the Dordogne, are associated with a culture known as Aurignacian, which is believed to have originated somewhere in the Middle East, perhaps in the region of Palestine. These people were rather tall, with long heads, very large brain-cases, and short, broad faces. They were responsible for very fine cave paintings, depicting the animals they hunted, such as the mammoth, woolly rhinoceros, and reindeer.

Africa.—From their original homeland, these people spread westwards not only over Europe but also along the southern shores of the Mediterranean through North Africa. In East Africa too skeletons which are typical of the Mediterranean race have been found associated with an Upper Palaeolithic industry not unlike the Aurignacian of Western Europe. Curiously enough no skeletons showing characteristic Negroid traits have been found in Africa before post-Pleistocene times, about 8000 B.C., which suggests that the Negroid stock evolved relatively late. In southern Africa there were in Upper Pleistocene times people with very large brain-cases and yet with features reminiscent of the present Bushmen and Hottentots, the first skull of this type, from Boskop in the Transvaal, was found as long ago as 1913.

Asia.—Turning now to Asia, the most remarkable finds of early *Homo sapiens* come from the Upper Cave at Chou Kou Tien (where Pekin Man was discovered). One of the skeletons, an elderly man, is very like the "Old Man of Cro-Magnon." There were also two females, one of whom shows Mongoloid features, and the other has been compared with the modern Melanesians. In Java the descendants of Solo Man may be represented by the Wadjak people, probably dating from around 8000 B.C., who bear a striking resemblance to the Australian aborigines. They may be roughly contemporary with a skull from Keilor near Melbourne, which proves that Australia was populated in late Pleistocene or early post-Pleistocene times.

America.—The question of the date of the first peopling of the New World is very controversial, in nearly every case the geological evidence for the association of early human remains has been questioned. It seems that the first immigrants from Asia crossed the Behring Straits before the end of the Ice Age, perhaps about 10,000 B.C. They are believed to have been of an "archaic White" strain, something like the modern Ainu and Australian aborigines, and probably similar to the "old man" of the Upper Cave at Chou Kou Tien. Later immigrants were fully Mongoloid, and it seems that a mixture of these two strains gave rise to the American Indian.

The End of the Old Stone Age.—From this brief review of developments all over the world we must return to the Upper Palaeolithic in Western Europe. We left the Cro-Magnons with their Aurignacian culture during the second cold phase of the Last Glaciation. During the time of the main advance of the ice sheets, about 18,000 B.C., the Aurignacian culture died out and was replaced first by the Solutrian and then by the Magdalenian cultures. The Magdalenians are renowned for their very fine working of bone and antler, particularly in the form of barbed harpoons, and for their artistic skill. In many ways their paintings of animals, such as those in the cave of Lascaux, surpass the ones of the Aurignacian period. As the Ice Age drew to a close, however, the Magdalenians disappeared, and with them the great flowering of Upper Palaeolithic art also died out.

Up till the end of the Ice Age, Palaeolithic people must have lived in essentially the same way all over the world. They were hunters and food-gatherers, living in small bands as the Bushmen and Australian aborigines do today. Within these small, isolated groups, certain mutations must have arisen which were advantageous in particular environments. These would have been encouraged by natural selection, thus leading to the differentiation of distinct races in different localities.

After the ice finally retreated about 8000 B.C. the way of life of people in Europe must have changed considerably. The great herds of cold-loving animals upon which Palaeolithic hunters depended for their food either became extinct or retreated as forests began to spread over the open country of former times. The Mesolithic people—living after the end of the Pleistocene and before the Neolithic stage—had to rely increasingly on fishing and collecting shell-fish to supplement their diet.

Outside the areas affected by the ice, however, certain progressive people gave up their nomadic existence and began to live in settled communities. In Palestine and other parts of the Middle East wild wheat and barley grew and there were herds of wild goats and sheep. The Mesolithic Natufians reaped these grasses and cereals and domesticated the dog to help in hunting. It was they who led the way to events which were to revolutionise Neolithic Man's way of life: agriculture and stock-keeping.

ENVIRONMENT AND CULTURE

It is clear that no people could enter a Bronze or Iron Age unless bronze and iron were, in fact, available in their environment. Hence the Eskimos, who have no metals available to make into weapons or ornaments, still use stone, ivory (from walrus tusks), and bone. In short, their environment does not permit a higher degree of culture. The primitive races or "backward" peoples have evolved ways of life which are often well adapted to the environments in which they live, and, after all, it is by no means self-evident that a civilisation which has devised atomic warfare, a high degree of economic frustration, and concentration camps is a "superior" one, however we choose to define superiority. The second point, again an obvious one which is almost invariably forgotten, is that great advances are only made upon the foundations erected by others. The scientists of ancient Greece, Newton, or Copernicus could not possibly have evolved Relativity Theory, not because they were less intelligent than Einstein, but because every innovator can only progress a little beyond what he has received from his predecessors in many different lands and times. The house of science is not built top floor first, but slowly upon the bases laid by earlier thinkers. "Civilisation" is not such a simple concept as we once supposed, and technological advance does not necessarily imply high moral standards. Scientists are agreed, that there are no significant intellectual differences between any of the races in existence today, and that the reason why some peoples are relatively backward is either because the raw materials necessary for technological advance have been lacking in their environment, or because by a historical accident their country has been out of contact with the general flow of civilisation, so that the spread of new ideas did not reach within their boundaries.

Definition of Terms.—Anthropologists are agreed that, although it may be quite correct to speak of "national character," we cannot explain this in terms of race or heredity. The true explanation is that such traits are cultural rather than biological in origin, and, since the "culture concept" is immensely important in modern social science, we must first of all define our terms.

> A *society* is a group of people who live and work together, regarding themselves as members of the group, and feeling towards it an emotion best described as "belonging."
>
> A *culture* is the way of life followed by such a group—that is to say, its written or unwritten laws, its religious beliefs, its ideals, its art, technology, and even its pots and pans.

Without written records we are left to deduce the record of prehistoric man by the culture to which he belonged—Azilian, Magdalenian, Chellean, and

so on—and here the archæologist, who knows very little of the ideals and religious beliefs or laws of these bygone peoples is generally thinking in terms of their *material* culture. The material culture, as we have seen, includes such objects found during excavations as pots and pans, knives, weapons, needles, and ornaments. But when we talk of culture in relation to present-day peoples, although such objects are included in our definitions, we are more often thinking of the way of life of the group—its ideals, incentives, and unwritten laws. Culture is what has been described as the "cake of custom," and its importance lies in the fact that it is the cement which binds the members of a group into a living organism.

Sub-Cultures.—It should not be thought that the word "group" necessarily refers to the national and tribal groups with which we have so far been concerned. Any semi-permanent collection of people within which the members have a sense of belonging together and possessing common beliefs and customs is a "group." All of us are members, not of one group only, but of many, and each group, however small, has a culture of its own, a way of life to which we must conform if we wish to retain group membership or, at any rate, the respect of the other members. As an example, let us take an imaginary individual with the name of George Campbell, who happens to be a Lowland Scot, a Presbyterian, a Socialist, a coal-miner working at the coal-face in a particular pit, a pigeon-fancier, and a follower of Newcastle United football team. The interesting thing is that, knowing these facts, we already know a great deal about Mr. Campbell, for we can be sure that his membership of these groups (national, religious, political, sporting, and so on) will strongly influence his behaviour. One of the serious defects of classical psychology and of much popular thought is that it failed to notice how much of the individual's day-to-day behaviour arises, not from the depths of his unconscious or from what is ordinarily described as his "character," but simply from his need to conform to the, often unwritten, rules of his membership groups. If anyone suggested to our Mr Campbell that he was not an entirely free agent, that he was not as independent as he prides himself on being, he would, no doubt, be very annoyed. Nevertheless, this is merely a commonplace statement of fact. Campbell has all the prejudices of the Lowland Scot—he thinks that education is a "grand thing," that Roman Catholics are a dangerous and superstitious sect, that the English are a somewhat inferior nation over the Border who regrettably lack stamina and intelligence, and that money, although the root of all evil, is a good thing to have and be careful about. But, had he been born in the South of Italy, he would have regarded education as the exclusive possession of wealthy landowners, Catholicism as the only true religion, the English would have meant little to him at all (until the last war), and his goods would be exchanged by barter rather than money. Mr Campbell enjoys his morning porridge and bacon and eggs, but his enjoyment of them is only a prejudice learned in childhood and his opposite numbers in Africa and France enjoy locusts, frog's legs, and snails, which it has never struck him to regard as "food" at all. His grandfather might have worn a beard, but if Campbell came to work wearing one, he might find himself in difficulties; this is one of the many quite innocuous things which are "not done" in certain groups. Campbell might, on special occasions, wear a kilt, but Mr Smith over the Border would find himself under considerable social pressure to stop doing so if he ever had the temerity to start. There is no law saying that Scots or Englishmen may not strip to the waist in a hot cinema or theatre, but they do not do so, although a miner may do so at work and other people at the seaside. In short, Mr Campbell, like the rest of us, is for the most part a creature of custom.

Personality and Culture.—The influence of culture upon the members of a society is not restricted to the sort of things we have mentioned above: to food, clothing, and etiquette. It is now certain that human personality itself results in large measure from the interaction between biological inheritance and the particular culture into which the individual happens to have been born; personality is the subjective aspect of culture. Psychologists are all in agreement, whatever the nature of their other differences, that the personality is created in the first five years of life as the result of parental training, and this training, it is clear, is strongly influenced by the attitudes which society impresses upon the parents.

Patterns of Conduct.—If we take the usual analogy of the clay, the potter, and the design, then it will be seen that the newborn child (the clay) is modelled by the parents (the potter), not at random, but according to the approved pattern of a particular society (the design). Everyone, into whatever society he is born, is brought up to have specific attitudes to women or men, to sexual relations, to cleanliness, to aggressiveness, and to competition, and these attitudes are unique to each society at any given time. Most middle-class Englishmen feel that they ought to "get on" and have ambitions, that one should not strike a woman, that one ought to have a daily bath, and that it is rude to argue in public with shopkeepers, waiters, and public servants. Frenchmen and Italians have no such inhibitions about arguing in public, and Americans have a much stronger desire to succeed. Such differences in national or class character may often cause difficulties through misunderstanding. For example, the average British worker attaches more importance to sticking together with his mates than to getting on, and he rather despises the middle-class attitude that one must succeed at all costs, regardless of whom one has to overcome in order to get there. Then the average American is brought up to feel that when he has made more money than someone else, he should be proud of his achievement and make no secret of his opulence, however temporary, while on the other hand the Englishman feels that it is impolite to discuss money or speak of one's achievements. Therefore to the American the Englishman is a queer, reticent, and "stodgy" individual, to the Englishman the American is noisy and boastful. Neither accusation is true—both are judging each other in terms of how they have been taught people ought to behave.

Interaction of Group Influences.—Although we have so far spoken of the national character of such large groups as the British, American, French, and Italians, it is obvious that when dealing with groups of this size composed of many subgroups, the resulting picture will be far from clear. Our Mr Campbell is, to the foreigner, simply "British," but he is, as we have seen, also a Scot, a Protestant, a member of the working-class, and a miner. So, although he shows many traits which are "British" in the widest sense, he differs in obvious ways from another Britisher who was born in London, is of the middle-class, belongs to the Church of England, and works as an accountant. It is not only national, but also regional, religious, class, and occupational groups which influence personality, and there are other factors also at work which we must shortly discuss. Before doing so, however, we must mention some important researches into the relationship between personality and culture in more primitive peoples, where the picture, for various reasons, is much clearer. Primitive peoples are more suited to anthropological studies, because, in the first place, they can be separated into small tribal communities which are for the most part, not subdivided into regional, class, or religious subgroups. Secondly, they are much less subject to social change, and have remained closely integrated, undivided, and in varying degrees static for considerable periods of time.

Primitive Tribes.—Ruth Benedict and Margaret Mead carried out anthropological surveys of

many primitive tribes in the South Sea Islands, New Guinea, and Central America, with results which are of the first importance to anyone who wishes to understand human nature. They show, in particular, the immense influence of cultural factors in moulding personality, and demonstrate clearly how many traits which Europeans all too readily assume to be part of basic human nature are not "natural" at all In Samoa, for example, young girls pass through adolescence without any of the "storm and stress" accepted as inevitable in the West In New Guinea, amongst tribes living in neighbouring areas and belonging to identical racial groups, Dr Mead found that characteristics of men and women believed to be fundamental in Europe were often radically altered In the Arapesh tribe, both men and women are mild and gentle, in the Mundugumor, both sexes are violent and aggressive, and amongst the third tribe, the Tchambuli, the "normal" sex-attitudes are completely reversed Tchambuli women are dominant, managing, and impersonal, whilst the men are "flighty," less responsible, and emotionally dependent There can be little doubt that many of the traits believed by Europeans and Americans to be definitely feminine or masculine are not biologically but culturally determined Amongst the Zuni Indians of New Mexico, Ruth Benedict found a people who were gentle, non-aggressive, and non-competitive to a degree quite unknown in industrialised countries The Zuni *try* to lose races, try not to be superior to others, have nothing but contempt for those who wish power and authority, and would have no chiefs at all were it not that certain individuals are compelled to assume chieftainship under threat of imprisonment On the other hand, the Mundugumor of New Guinea far outdo the industrial West in competitive spirit, aggressiveness, and in their dominant attitude of "each man for himself and devil take the hindmost" The Kwakiutl Indians of Puget Sound, unlike ourselves, spend all their time giving away wealth instead of accumulating it, at their ceremonial feasts or *potlatches* they tear up money and compete with each other as to who can burn or otherwise destroy most of their riches The Dobu, another New Guinea tribe, are so suspicious that, were a Dobuan transported to England, he would probably be certified as suffering from persecution mania—yet this trait is "normal" within that community In Bali, the "normal" attitude, says Dr Roheim, is one which elsewhere would be regarded as schizophrenic, for there, "we have that unthinkable thing, a schizophrenic culture" Yet every one of these traits is acquired by the individual during childhood - and, indeed, Dr Mead has shown how varying methods of child-rearing lead to the results observed in the adults of a culture "Systems of child-training" writes Erik Erikson, "represent unconscious attempts at creating out of human raw material that configuration of attitudes which is (or once was) the optimum under the tribe's particular natural conditions and economic-historic necessities"

Summary.—From these recent observations and researches we may make the following deductions

(1) That the culture of any society represents an attempt to adjust to a particular environment, using the word in the widest sense to imply not only the physical environment, its raw materials, and climate, but also the past traditions of the society, its technology, and so on We can see, for example, how American history, with its background of an expanding frontier and its awareness of having escaped from the old traditionalist societies of Europe, has strongly influenced American national character Similarly, the glorification of "free enterprise" amongst the English middle classes, and the equal and opposite insistence upon collective action amongst the working classes, are both the result of historical necessities In the processes of bringing up families parents hand on these attitudes to their children.

(2) Human nature is more adaptable than has hitherto been thought It is *not* "natural" to want money, to compete, to have ambitions, to be warlike, nor for that matter, to be gentle, non-aggressive, and non-competitive Women are not naturally "feminine," maternal, and dependent, nor men "masculine," assertive, and independent. All these traits are acquired by learning and growing up in a particular culture There is, in short, no such thing as a "fundamental human nature"

(3) Human beings have no "instincts" as is the case with animals, all one finds in the infant at birth are certain *drives* or *needs*—the need to eat, to drink, to excrete, to be protected from the rigours of climate, the beginnings of sexual needs, and so on One need, however, although not strictly speaking innate, is universal because of the inevitable fact of dependency in childhood: this is the need for approval or, in the widest sense, love As Ruth Benedict has said: "Man is a highly gregarious animal and he always wants the approval of his fellows First, of course, he has to get the means of keeping alive, but after that he will try to get approval in forms which his society recognises His society may recognise conquest, and he will engage in conquest, it may recognise wealth, and he will measure success by dollars and cents, it may recognise caste, and he will behave in all things according to the position to which he was born."

(4) Without socialisation, without parental upbringing, human beings could not become anything at all There is no such thing as the "natural" individual, the "noble savage" of Rousseau In the few reported cases where a child has survived without any sort of attention other than receiving food and drink it has not been appreciably different from one of the higher apes One child of eight years born of a deaf and dumb mother and reared in an attic in complete seclusion from other people, could not even appreciate sound, It had been accustomed by its mother's deafness to ignore noises, and even the loudest sound produced no reaction, although the ears were quite normal

Most of a person's actions, therefore, are carried out either to satisfy the innate biological drives mentioned above, or to satisfy the deep-seated, universal, although probably not innate need for emotional security and approval Men seek wealth, position, knowledge and so on, not out of a primary desire for these things, but because they are the roads to approval within the frame-work of a given society

Individual Differences.—Now, as we can readily observe, individuals differ quite considerably from each other, even within the same social group, so we must now consider what factors give rise to the individual variations upon the theme set by culture, several, in fact, have already been mentioned These are, the subgroups to which the individual belongs, his status and role, and his particular upbringing and inheritance. Social change, too, gradually brings about changes in the "basic personality type" of a society, as, for example, the changes in the Englishman's attitude to, say, music and sport which took place between Elizabethan and Victorian times

1 *The Influence of Subgroups* in bringing about particular attitudes in the individual has already been discussed, and need not be further elaborated here

2 *Status and Role* —An individual's status is his position in society, not only in respect of social class, but also in occupational, marital, professional, and other spheres His role is the behaviour which is associated in that society with a given status Perhaps these concepts are most simply explained if we regard social life as a sort of stage-play in which each individual is an actor in particular roles a parson has to act as a parson, a doctor as a doctor, a father as a father, and a manager as a manager Parsons are expected to talk and dress in a particular manner, fathers to behave in a certain way (which differs in each society), and although every parson or father is an individual in his own right, many of his acts can be understood only when we realise that he is acting in the way society expects of

parsons and fathers When people break these unwritten rules, difficulties may arise There is no law which says that a parson may not play the saxophone, but one who did would be looked on somewhat askance by his parishioners, and, although patients sometimes complain that their physician puts on an exaggerated "bed-side manner," they are often even more distressed when he does not. Gordon Rattray Taylor tells of a factor manager who went about in a shabby old car, and who, far from being thought endearing and democratic for doing so, was regarded with disapproval by his employees, who felt that he was "letting down the side" by not behaving in a manner appropriate to his position This is what is described as "*formal status*," since managers, parsons, fathers, and so on occupy formal positions recognised by society as at present constituted. There is also *informal* status—that is to say, the type of status allotted to individuals in a small and intimate group such as the working group in the factory For example, we have George, who is the one who defies management and takes the lead when complaints are to be made, Alf, the one who tells dubious funny stories, Bill, the one who knows all about First Aid, and Harry, the amiable idiot who is always teased by group members but protected from the jibes of the members of other groups All these individuals have been allotted a certain informal status, and are supposed to act "in character," although each man in another group may play a quite different role Alf, the joker, may be henpecked at home - a sad little man, Bill, the knowledgeable First Aider, may be a very insignificant member of the local St John's Ambulance Brigade, to whom he may be the "silly ass", George, the resentful, may be the kindly father But within each group their roles are fixed and difficult to evade Status and role, therefore, have a powerful influence upon behaviour

3 *Differences due to Upbringing and Heredity* — Although we have already indicated that the influence of heredity, so far as personality is concerned, has been grossly exaggerated, it does indeed play some part What is inherited, however, is not specific behaviour but temperament, and temperamental differences, being based on glandular and structural nervous factors, are fairly permanent features of the personality By and large, upbringing determines *what* we do, temperament *how* we do it

The most important differences between one individual and another in the same culture arise from the vagaries of upbringing, for, even apart from such accidents of fate as the loss of one or both parents, illness in childhood, and natural calamities, the obvious fact is that no parents ever pass on the cultural design to their children without many individual variations If we picture the cultural design as a rough mould which supplies the main outlines of the pattern, we can also picture the parents as adding individual touches of their own (whether knowingly or otherwise) to a material which already varies for biological reasons At this point it is necessary to say something of the work of Freud, for it is he who has given us some of our closest insights into what one might describe as the microscopic anatomy of the individual personality Unfortunately to do so is by no means easy because Freudian theory is extremely complex, and has, furthermore, been considerably modified by later writers of the psycho-analytic school What is given here must be taken only as a very rough outline of what Freud and later psycho-analysts have been trying to say

FREUDIAN THEORY.

The newborn child is a young animal, with no morals or sense of reality and no "instincts" as we understand the term in the lower animals It has only two great drives which Freud takes to be fundamental—sex and aggression. Although Freud described **sex** and aggression as "instincts," the word is nowadays reserved for a particular form of behaviour which, if it exists at all in man, is certainly a dying category—it should be used solely for behaviour which is inborn, relatively fixed, and automatic Ants, bees, and wasps, for example, carry out the most detailed acts, nest-building, caring for the grubs, or food-collecting and storing, but there can be no doubt at all that none of these acts is in any way intelligent They are based on the insect's nervous structure, and could not occur otherwise than they do Amongst the higher animals, the birds and mammals, such instinctual behaviour comes to be increasingly modified by intelligence, but it is only in man that intelligence assumes its full significance, and all behaviour is modifiable and no longer automatic The drives of sex and aggression in man do not involve any elaborate type of fixed behaviour pattern, they are simply the raw material of action, to be modified in many different ways as the child learns from its parents and others Briefly, all animals in varying degrees (more so in the lower animals, less so amongst the higher) are like tram-cars moving upon fixed rails, and however complex the route they take, it is largely what has been laid down from the beginning Human beings, on the other hand, are like motor cars, which, although making use of the same source of energy as the animals, can utilise it to drive where they please

Sex.—Freud used the word sex in a rather specialised sense to apply, not only to sexual behaviour in the ordinary meaning of the word, but also to such behaviour as eating and drinking, excretion, and, at a higher level, to love and friendship It might almost be said that in Freudian terminology sex and aggression are words used to describe the two poles of desire, positive (love, lust, hunger, longing, wanting) and negative (hating, fearing, avoiding, killing, getting rid of things)

The Id.—The problem of society is to modify this primitive creature which can only need and desire, hate or fear, want pleasure and avoid pain, into a civilised being, and this is the problem it delegates to the parents, who, in the long run, utilise the child's need for security or protection and care to compel it to act in approved ways The baby learns, by imitation, by trial and error, by punishment or the threat of punishment, by love or fear of the loss of love, to conform more or less to social standards The primitive aspect of the mind, which includes not only the innate drives of sex and aggression but also all those thoughts and emotions which, in the course of development, the individual comes to accept as forbidden, is described as the Id, and just because it contains this sort of material, thoughts and emotions within it become or remain unconscious

When the infant is born, its mind is all Id, but sooner or later the child is confronted by stern reality when it comes to realise that desires are not satisfied automatically Sometimes it is hungry and food is not forthcoming, sometimes it is wet and uncomfortable and has to wait to be "changed" -all these events occur even to the most fortunate baby

The Ego.—So a part of the mind comes to be separated off from the primitive Id, whose function it is to deal with reality, and this part is known as the Ego—the conscious mind as we know it in adult life The basic function of the Ego is to deal with life as it really is, not as we should like it to be

The Superego.—Still later, perhaps about the age of three or four, the child is faced by another problem, for it has to start conforming to the ethical dictates of society, to what is ordinarily described as the moral code It has to learn what is done and what must not be done, and so a further division in the mind takes place and part of the mind begins to specialise in moral control. This part is known as the Superego. The Superego arises in two distinct stages—firstly, the child comes to realise that, under penalty of punishment or disapproval, it must obey its parents; at this stage, then, compulsion comes from outside. Later, however, the child by a process of what

Freud describes as "introjection" takes the parental standards within itself One part of the mind, as it were, plays the role of the moral parent in relation to the rest This is the fully-fledged Superego

Character.—An individual's character is the result of a three-cornered struggle between the primitive biological drives (represented by the Id), the hard facts of reality (represented by the Ego), and the moral dictates of society (represented by the Superego) The Superego is the censor which forbids thoughts or actions not allowed by society or, more accurately, thoughts or actions which were forbidden by the parents in early childhood As one writer says, the Superego is a sort of psychological gyroscope which places control within the mind and avoids, in varying degrees, the need for outward compulsion When the dictates of the Superego are transgressed the individual has a sense of guilt and feels himself more or less a social outcast

Expression of Primitive Impulses- But the primitive drives are very powerful and cannot be totally repressed—they demand some sort of outlet, and are given it on condition that they are suitably modified or appear in socially acceptable forms or at least at socially acceptable times Most societies, for example, permit the expression of primitive emotion at certain periods or under certain conditions, the sexual drive is permitted expression in marriage, and naked aggression in warfare But more often the drives have to be modified by one or other of two fundamental mechanisms known as reaction formation and sublimation In the case of reaction formation the energy of the forbidden impulse is utilised in emphasising its opposite, it is as if the individual were saying "Of course I don't have such wicked desires—you can see I am quite another sort of person" Perhaps this mechanism will become clearer if we give some examples.

(1) Even the layman is aware that people who are excessively puritanical are frequently by their very puritanism demonstrating quite the contrary aspects of their character We laugh at the elderly lady who is afraid of finding a man under her bed precisely because we are aware consciously or unconsciously, that she would not have the fear if she did not also have the hope Similarly, when we read in the papers of a gentleman who so disapproves of obscene books or magazines that he buys hundreds of them to find out whether they are suitable or not for others to read, we may suspect that his own motives are not entirely devoid of suspicion In short, the character-trait of puritanism is sometimes a reaction formation against strong sexual desires, the individual is fighting in the outer world the very problem he is unable to deal with in his own mind

(2) The above examples are fairly obvious to the normal individual, who has little difficulty in observing them in his own surroundings, but it is less often realised that aggression may be modified in the same way Some people, in other words, are compulsively gentle, non-assertive, and disposed to hate cruelty precisely because they are so full of aggression themselves (This does not mean to imply that there are no genuinely pure or gentle people, but merely that many supposedly pure and gentle people are really quite the opposite) When, for example, someone tells us that he would flog a man who illtreats a horse, it is obvious that, whatever else he may be, he is not basically gentle This is an extremely important problem, for if gentleness and kindness sometimes arise, not from a genuine love of all living things, but from fear of one's own aggressiveness, then sooner or later the real motive will become evident.

The second method of dealing with primitive impulses is by sublimation—that is to say, by making them socially useful A butcher, a surgeon, or a prize-fighter are all expressing in modified form their latent sadism, but in a way which is recognised by society Women who have wanted children and failed to have them may become teachers, helpers in nursery schools, and so on in a valuable attempt to satisfy a frustrated need If Freud is correct, the frustrated sexual curiosity of childhood may later take the form of a desire to know, causing the individual to become a scientist or a bookworm Art, sculpture, and painting may all be sublimations of the infant's natural dirtiness and pleasure in messing about with mud, water, or even its own excretions The reader may or may not accept these latter assumptions, but it is only fair to say that those who are in a position to know have found a great deal to support Freud's theories

Mental Mechanisms.—Even in adult life the individual's adjustment to reality—the "hard facts of life"—and to moral problems is never complete, and self-deception is common In this connection Freud describes various mental mechanisms which even those who do not accept the Freudian theory in its entirety have found valuable in understanding human behaviour We will conclude, therefore, by describing some of these forms of self-deception here and giving examples of their influence upon human behaviour

1 *Displacement* —An emotion, when conditions do not permit its being directed towards a particular object, may be directed against another which originally had nothing to do with it "Love on the rebound" is an example of this in which, when the original object of love has disappeared, another is quickly found, not because of any real qualities possessed by the new object, but rather because the emotion demands some outlet Aggression, too, is very often displaced, for instance, an employee angered by his foreman or boss, but unable for obvious reasons to retort in kind, may quarrel with his wife over some triviality when he gets home In Nazi Germany Hitler permitted the displacement of economic and other resentments felt by the Germans after the Treaty of Versailles on to the Jews and Communists, who were thus made scapegoats for the convenience of the Nazi party It is important to understand that this is one of the commonest types of mental mechanism which is universally, although unconsciously, used by us all

2 *Projection* —This is an example of a mechanism which has already been demonstrated In brief, it means the tendency to project the objectionable qualities we refuse to recognise in ourselves upon others "It is not I but he who is thinking and doing these wicked things" Thus, as we have seen, people who will not admit to their own impure thoughts accuse others of possessing them, those who are aggressive believe that everybody else but themselves are aggressive, the greedy accuse others of greed, and so on Carried to an extreme degree, this is the mechanism behind persecution mania or paranoia, as the psychiatrist calls it Projection is another very important trick of the mind, and its social effects are often all too evident

3 *Compensation* — Alfred Adler, one of Freud's pupils who later founded a separate system of psychology, was the first to draw attention to this important mechanism

Briefly, Adler pointed out that those who suffer from a deep-seated sense of inferiority (whether due to physical or mental defects or to lack of affection in childhood) have a strong tendency to compensate for this either by overcoming the actual defect or by becoming superior in some other field *See* **Individual Psychology, Section J.**

4 *Rationalisation* —This, as Bradley said of philosophy, is "the giving of bad reasons for what we do upon impulse" Nowadays, for example, nobody ever goes to war in order to kill a lot of people or take their country from them, they go to war for the other nation's own good—because they want to help them Criminals are hanged, not because we as citizens are at a primitive stage of development which still demands "an eye for an eye and a tooth for a tooth," but because "hanging prevents further crimes" (of course, there is excellent evidence to

show that it does not). Rationalisation is too familiar to most of us to need further discussion.

5. *Conversion* —This is the mechanism which most people find it least easy to understand Whereas the other mechanisms are, in their milder forms at least, almost normal, conversion is always abnormal, and implies more or less serious disturbance of the mind There are two types of conversion hysterical and psychosomatic

In the first case, a state of mental conflict produces symptoms of physical disorder which, however, are not due to any underlying physical disease Such cases may show symptoms of blindness, deafness, complete or partial paralysis of the limbs, double personality, or loss of memory, all of which can be shown to be purely psychological in origin, and, in fact, occur because the individual in some sense does not want to be able to walk, see, hear, or remember In short, the symptom occurs because it gets the individual out of some difficulty which he is facing at that particular period

6 *Psychosomatic Conversion* — Psychosomatic conversion is a very different state of affairs, for, whereas the cases we have so far discussed have been those who had lost the *will*, and thus the ability, to carry out certain physical or mental functions people with psychosomatic disorders suffer from actual physical disease as a direct result of mental stress Within their bodies actual physical damage has resulted from prolonged exposure to emotional tensions Elsewhere (**P46 (1)**) something has been said about the autonomic nervous system which prepares the organism for relaxation or emergency The frustrated worker, hating his job and resenting his boss, has the raised blood-pressure normal to the angry animal, but it continues day in and day out until his arteries become thickened and the pressure can no longer return to normal The ambitious business-man, mentally on the attack for years at a time perpetuates the associated physical changes normal to an attitude of attack, his stomach-wall is drained of proper blood-supply and the digestive juices, ordinarily neutralised by anti-enzymes in the blood, digest the lining of the stomach itself, causing an ulcer Chronic states of anxiety or excitement may cause the thyroid gland perpetually to overact, leading to exophthalmic goitre Muscle tensions appropriate to aggressive attitudes when prolonged may in others lead to fibrositis and rheumatoid arthritis. The changes produced by emotional states in the skin may cause skin disease, and migraine, asthma, angina pectoris, and coronary thrombosis are other diseases of varying degrees of severity due basically to fear, insecurity, and hate Of course, what has been said here is inevitably over-simplified, for no disease is due to a single cause, nor is it at all clear why one patient gets one type of psychosomatic disease and a second another But there can be no doubt that the outlook in medicine has become revolutionised by these discoveries, and can never return to the old mechanistic views of the nineteenth century.

In summary, this is how views have altered·

(a) To a considerabe extent we must discard the old view that sickness is always something that happens to an unsuspecting individual, like being hit on the head by a falling slate Patients usually go to a doctor in much the same frame of mind as they would go to a watch-maker – " Here, there's something wrong with this watch—what are *you* going to do about it? " But from now on it has to be realised that the patient and the illness are one, that it is because he is the sort of person he is that he has become ill in a particular way It is quite literally true that today we are entering a stage in the development of medicine which will look on crime as social or mental sickness and much disease as the result of the individual's wrong attitude to life.

(b) There are of course, diseases in which psychological factors are at a minimum so far as causation is concerned, although psychological factors always play a major part in determining the course of the disease Smallpox, malaria, cholera, natural calamities (like the slate falling on our unsuspecting head), and diseases due to malnutrition (where food has not been available) are examples of such conditions These are the diseases which are serious problems in the more backward areas of the world, and are, on the whole, less important in the civilised areas Psychosomatic factors, however, play a considerable part, in the case of the less-virulent infectious diseases, in determining whether the patient succumbs to the infection or not For example, Dr Wittkower has shown that psychological factors play a large part in determining resistance to tuberculosis and the subsequent course of the disease Sir William Osler, the great physician, used to say of tuberculosis that what the patient has in his head is more important than what he has in his chest The psychosomatic diseases already mentioned and the neuroses are, of course, examples in which the psychological factor is at a maximum.

(c) Fear and hate or anxiety not only cause unhappiness but also sickness and death Hate and fear can kill

(d) The psychosomatic diseases and the mental disorders generally are social diseases They are strongly influenced by the stress of modern life and are on the increase The present position is that, as Dr J L Halliday has shown in his *Psychosocial Medicine*, although such diseases as smallpox, typhoid, rickets, the conditions due to dirt, faulty hygiene and malnutrition, are well on the way to disappearing in the more advanced communities, *in these very same communities* the rate of neurosis, gastric and duodenal ulcer, heart disease, glandular diseases, high blood-pressure, suicide, infertility, and delinquency is going rapidly up It is not only going up, but the diseases are attacking younger and younger people in each generation As an example showing the relationship between social stress and psychosomatic disease we might point to high blood-pressure, which is even more frequent amongst the Negro population of the United States than amongst the Whites (who have probably the highest rate in the world), whereas primitive Negro tribes in Africa do not suffer from this condition at all

(e) Finally, mention must be made of the body-mind problem which these observations bring to the fore Ultimately, of course, this problem is a philosophical one which cannot be decided by observation or experiment, but today psychologists and doctors are inclined to make use of the working hypothesis that body and mind are one – that " mind " is only a useful word to refer to certain processes occurring in the body Curiously enough, it was the mechanistic outlook of science which necessitated the hypothesis of a separate mind, for, if we begin by assuming that the body is a machine (which it is not), then we require some explanation for the fact that it sometimes acts as if it were something else It must be realised that living things are not dead matter *plus* something else—they are simply living things with their own laws which cannot be described in the same terminology as those of physics and chemistry Each of the spheres we have discussed—the inorganic, the biological, and the social, have their own laws, and one cannot be fully described in terms of the other Scientists have discarded the mechanistic view, which implied that the whole was nothing but the sum of its parts and that we could best know the whole by studying each of the parts separately and then adding up our impressions, but they have not necessarily discarded materialism. *See also* **Mind and Matter, Section J.**

SOCIAL CHANGE

Changes in Social Institutions and Beliefs.—The vast majority of sociologists have taken the view that social change in the psychological and moral spheres is based upon changes in the material culture due to inventions and discoveries which alter the character of the powers of production. These inventions may reach a society by spread

from another culture or by the scientific discoveries of its own men of science. What, in effect, this theory implies is the following (1) the most important thing to a society is its means of livelihood and its methods of production, (2) it will, therefore, tend to organise its social structure around its means of production, and its most important men will be those expert in that field, (3) it will also tend to organise its thoughts and even its religion and philosophy and science with a bias in favour of the outlook of its most important men—those who own the means of production

Wherever modern industry goes, it modifies the existing institutions of a society and brings about social change, just as it did in our own country In China the large peasant family is gradually disappearing as industry spreads, in India the caste system is breaking down (since one cannot bother about caste differences at a factory bench), the other-worldly religions like Buddhism come to mean less, the birth-rate gradually (if too slowly) goes down, the growing cities resulting from industrial expansion necessitate the giving-up of traditional attitudes in many things, notably in the field of hygiene and public health It is, therefore, primarily invention and the spread of inventions that brings about social change

The Theory of Cultural Lag.—Dr W F Ogburn of the University of Chicago has made a special study of the technological basis of social change and has pointed out two facts which are of primary importance in understanding modern problems First, there is the fact that, once social change has begun, it goes on at an ever-accelerating rate, each generation learns more, and invents more, than the preceding one because they have more facts and discoveries to work on A Greek in the third century B C could have dreamed of making steam do work, and Hero of Alexandria (*fl* A D. 62) invented a primitive steam-engine but in order to make an engine that would really work he would have had to invent by himself the wheel, the piston, the blast-furnace to produce the temperature necessary for melting and casting iron, the water-wheel to produce the mechanical blast, and so on All modern discoveries and inventions depend upon pre-existing inventions and discoveries, and therefore the more inventions a society possesses, the more it can make in the future This is why progress in the technical field goes on at an ever-increasing speed

Summary.—Now we have noted that social change occurs in three stages (1) men produce new inventions, (2) these inventions influence human behaviour, and (3) finally, social institutions and beliefs are changed to allow for the new inventions The motor car, for instance, has brought distant places close, revolutionised sexual morals, produced ribbon development, brought about the spread of housing estates beyond the original boundaries of the large cities, led to an entirely new problem as mounting casualty lists resulted from the use of a new machine upon old roads intended for horse traffic Dr Ogburn points out that there is always a "cultural lag" between stages (1) and (3) and that this is the cause of many of our modern difficulties We have vehicles travelling at fifty or more miles an hour on roads intended for horse-traffic, and the daily papers talking of the importance of "private enterprise" and free competition when these have long ago become an impossibility—*not* because of the spread of "socialism," but because businessmen found "private enterprise" and unrestricted competition so unpleasant that they began to form combines and trusts precisely in order to avoid it In short, the old ways of thinking tend to persist long after the situation which was their justification has changed

SOCIAL AND PSYCHOLOGICAL PROBLEMS OF MODERN LIFE

1 **Insecurity.**—The principal reasons for the psychological insecurity felt by many people today (and also, of course, for the current emphasis upon economic security) arise essentially out of the way of life which displaced the peasant society in medieval times Medieval society was closely integrated, each man knew how he should behave and what were his duties and obligations The earth was the centre of the universe, heaven was above and hell beneath, and through the medium of the Church he knew exactly what he had to do—the world, in a word, was *comprehensible* *See also* **Q2-4.** The rise of capitalism led to the rise of the isolated individual

2 **Loss of Social Control.**—Modern industry demands greater mobility of labour, and modern inventions have made transport cheap and speedy The small permanent village community of people bound together by primary relationships (whether of love or friendship, resentment or dislike) is therefore broken up, and people become increasingly "rootless" Now, an individual's moral behaviour is controlled (*a*) by the Superego or conscience acquired in childhood, which is not always effective, partly because it is concerned only with the more fundamental matters, and also because of parental defects in upbringing, (*b*) by the social control of the groups to which the individual belongs—in short, by fear of the opinions or ridicule of others Amongst the vast majority of people (*b*) is much more important than (*a*) in controlling behaviour But when people are scattered far and wide, living amongst strangers, the small face-to-face group no longer influences their actions, and their conduct tends to deteriorate, in fact, not only morals but also mental health is strongly influenced by membership of small groups, and in the absence of such membership neurosis becomes more probable This is why groups of immigrants from other countries present a social problem quite other than the superficial ones which usually cause concern, torn between the old standards which they are rapidly losing, and not yet indoctrinated with the ways of their adopted country, such people are likely to find themselves in difficulties

3 **Social Conflicts.**—Society itself, so far from being all of a piece, is riddled with irreconcilable conflicts One government will encourage "private enterprise," and the succeeding one cheerfully announce that people who engage in private enterprise are scoundrels We are taught by religion (in the case of America it is stated in the constitution) that "all men are equal," and yet we persecute Negroes and Jews Doctors urge us to give up cigarette smoking because of the danger of lung cancer, while advertisers encourage us to smoke more. We are told to "love one another" and in the same voice to "never give a sucker an even break" We stimulate ambition and yet live in a state of affairs in which promotion is increasingly improbable, for example, about thirty years ago it was quite possible (if not as common as might be supposed) for an employee to work his way from the shop-floor to the board of directors Now, such jobs are increasingly filled by university graduates who have had little to do with manual work. Even in America, once the land of hope, the social classes are tending to become fixed and promotion less likely than before An eminent sociologist has pointed out that gambling is the result of stimulating people's desire to achieve wealth whilst failing to devise legitimate means of obtaining it It is almost always forgotten that frustration is a relative concept—that people are frustrated, not in some absolute sense, but in relation to what they have been led to expect. Thus, miserable as is the lot of many peasants in Asia and elsewhere, they may be much happier than the senior factory manager who expected to be taken on to the board and was passed over. Material goods are important aids to happiness, but in themselves they are not enough; for almost everyone is unhappy, no matter what his possessions, if he feels that what he has is not in accord with what he is entitled to But what is he entitled to? The plain fact is that in spite of much talk of "fair shares" or a "fair wage," we have no idea what a man is entitled to because it is nothing but a social convention that a doctor should be paid more than a miner, and the old social conventions of this sort, good or bad, have disintegrated.

4 **Racial Conflicts.**—It need hardly be pointed out that this is an increasingly difficult problem which cannot be solved by asserting, no matter how often, that there are no superior races or nations. The real dilemma of such a country as South Africa should not be underestimated, however it may be oversimplified on both sides of the fence, for the fact is that in such a country there are only two possibilities, both of which would lead to equally unpleasant results for the White minority in power. Either (1) they hold the Black peoples down, in which case there will sooner or later be bloody rebellion, or (2) they give the Black peoples equal parliamentary rights, in which case, since the Blacks vastly outnumber the Whites, the ruling minority automatically hand over control to the Blacks.

5 **The Problem of War.**—Psycho-analytic writers have always asserted that aggression is an innate drive in man, and therefore that war is inevitable. To this attitude there are three answers. (1) that, if this is so, the human race is irrevocably doomed—for with modern weapons it would be difficult to survive one war, let alone an indefinite series, (2) that it is by no means certain that aggression is innate—most modern psychologists other than psycho-analysts state that aggression is the result of frustration, from which supposition it follows that, although aggression could never be entirely removed, it can be very considerably reduced by removing frustrations as far as possible, (3) that the problem of war has really nothing to do at all with whether aggression is, or is not, innate—what matters is not *whether* we are aggressive, but what we do with our aggression, and war is not at all the most obvious means of getting rid of aggression.

At one time it was thought natural for Scotland to fight England, or, at an even earlier stage, for the various kingdoms into which England was divided, to fight each other. Now such an idea would appear fantastic—not because the Scots learned to love the English, not because morals have improved, but simply because the countries concerned became one world economically and administratively. There can be no doubt that modern discoveries and technology have made it essential for the whole earth to become one economically and administratively—not only essential but inevitable. And, given time, this will quite certainly happen, whether we are willing or not, provided, of course, that we do not blow ourselves up first. When that day comes, we need not bother about the problem of aggression, for, as we have already seen, there are more than enough evils to fight and more than enough problems to tax the best brains for centuries to come, and when we have dealt with these we shall probably find that we have grown up.

6 **Religion and Science.**—In the nineteenth century religion took a good beating from science because it had rashly chosen to discuss matters of scientific fact, such as the theory of evolution. The war between religion and science is over—not as many people seem to suppose, because one side or the other has won, not because the new scientific theories support religious beliefs (for they certainly do not)—but rather because each has come to realise that their respective spheres of influence are largely separate. The scientist *as* scientist looks at the universe without emotion and as objectively as possible whereas in the sphere of religion we are concerned about how we *feel* towards it. We look on it with awe, fear, or love, as in some sense our home. "Religion," said William James, "is a feeling of being at home in the universe."

No doubt religion is also a great deal more than this, but James' statement contains a fundamental truth and in this sense we are all religious, for there is nobody living who is capable of regarding the universe with complete impartiality except for relatively brief periods of time, as the scientist does when carrying out an experiment. As we have seen elsewhere, one of man's deepest needs is to have a feeling of emotional security, a sense of belonging, and the consciousness of understanding his relationship to his environment. Erich Fromm, a psychologist who has made a special study of religion, describes the need we have just mentioned as the need for a "frame of orientation and devotion." Whereas Freud considered religion to be a universal neurosis based upon the need to conciliate the father-figure God—a projection of the child's view of its family into the celestial sphere—Fromm reverses this statement and tells us that, on the contrary, neurosis is a private religion. Whereas religion is a public frame of orientation and devotion, each man's neurosis is a private one, or at least, one aspect of a neurosis is the development of a private set of attitudes to life which is in conflict with those of society as a whole. Franz Kafka's novel *The Castle* is a modern parable of the neurotic's isolation from society and life which explains more about the individual's need of a frame of orientation and devotion, and the results of the lack of it than many volumes of psychology.

Summary.—It should be pointed out that in psychology today there are two different points of view which here we have tried to reconcile. (*a*) the psycho-analytic view, which holds that personality is fixed, and is determined in the first four or five years of life, and (*b*) the sociological view that personality, although strongly influenced by these factors, is also influenced by the roles the individual has to play and the situations he has to face in adult life. The views are not necessarily contradictory, what we have to ask ourselves is not whether this view or that, but *how much* of each view, is true. Freud largely ignored the influence of culture, firstly, because all the people he was dealing with belonged to the same culture, and, secondly, because at the time he produced his theories it was assumed that "human nature" was the same all over the world.

Nevertheless, whatever we think of Freud, the one aspect of his work which is beyond doubt is that for most of their lives people are influenced by motives which are unconscious, and of which they are completely unaware. The individual has a picture in his mind of the sort of person he supposes himself to be and uses the mental mechanisms we have described to maintain this picture, impulses which he cannot reconcile with his ego-ideal are simply rejected. The importance of this fact is evident—for it means that rational persuasion is not nearly so potent in influencing behaviour as has often been supposed.

THE MODERN VIEW OF MAN AND SOCIETY.

There are three types of individual who are in rebellion against society: the neurotic, the criminal, and the genius. The differences between the three are that the neurotic rebels in secret or unconsciously, the criminal openly, and the genius by his creative work is able to sublimate his conflicts in art or literature or even to change society nearer to his heart's desire. (It will be understood that this is a very loose formulation of a very complex problem.)

Now it is the modern view that such conflicts are not private and individual as has hitherto been thought (notably by Freud), for it is the conflicts latent in a particular society which are fought out in sensitive minds. Briefly each society is now regarded as a sort of electro-magnetic field in which the neurotic, the criminal, and the genius are areas of high tension—in them the conflicts suffered by the society as a whole are magnified to the point of breakdown. Whereas, as was realised long ago, such diseases as cholera, typhoid, or smallpox are due to material defects of society in respect of hygiene and the application of medical knowledge, the behaviour of neurotics, criminals and those with psychosomatic disorders is due to cultural defects of the society in the psychological sphere.

Modern psychology and sociology are showing more clearly than ever before that, in the words of Donne, "no man is an island," and that for the misery or unhappiness or badness of the few we are all responsible.

IV. RECENT DEVELOPMENTS AND DISCOVERIES

SPACE RESEARCH.

Definition.

By space research we mean scientific research work which can only be carried out by means of equipment carried to otherwise inaccessible observing locations by rocket propulsion. Such propulsion does not rely on the presence of an atmosphere to provide oxygen so that it is capable in principle of conveying objects to unlimited distances. The subject of space research is, therefore, one which is concerned with scientific applications in various fields of a single highly specialised and powerful technique. It is not a single discipline, but can provide data of great importance for many, such as the physics of the earth, the sun, moon, and other bodies of the solar system, astronomy, geodesy, and the study of gravitation. The prospect of investigating the biological conditions on different planets such as Mars and Venus is also opened, as well as that of experimental biological studies under conditions of zero gravity. Although the results of many aspects of space research are vital for those concerned with the practical realisation of manned travel in space, space research is largely a branch of pure science, independent of any applications which may stem from it.

Scientific Applications

The Earth's Upper Atmosphere.

The greatest altitude attainable by balloons is about 20 miles. Much of great scientific interest remains to be investigated at greater altitudes. The ozone layer, which absorbs ultra-violet radiation which would be lethal to plant life if it reached the ground, is concentrated about the balloon limit but extends upwards to about twice that height. Near the 60-mile limit a number of important atmospheric phenomena occur. Above this level the oxygen becomes predominantly monatomic in contrast to the normal diatomic form at lower altitudes. The ionosphere, a region in which concentrations of free electrically charged particles—electrons and positive ions—occur in sufficient concentration to affect substantially the propagation of radio waves through the region, extends upwards from a height of 60 miles to several hundred miles. It is in fact most concentrated at an altitude of over 200 miles. Meteors are mainly burnt up near the 60-mile level though very small micrometeorites—fine dust less than 10^{-3} mm diameter—do not heat up sufficiently through atmospheric friction to evaporate, and gradually settle on the surface.

The bright atmospheric glows which are observed in the sky near polar latitudes—the northern aurora borealis and the southern aurora australis—are most frequently observed at altitudes near 60 miles but do extend at times to much higher altitudes. There exists also a much weaker glow—the night air-glow—which does not depend strongly on geographical location. Some of the light in this glow comes from photochemical reactions occurring at altitudes of 40–50 miles, some from much higher altitudes.

The behaviour of the upper atmosphere is strongly influenced by the sun. The electromagnetic radiation emitted continually by the sun is responsible, through its effect on atmospheric atoms and molecules, for the production of the ozone layer, the dissociation of diatomic to produce monatomic oxygen, the ionosphere, and the air-glow. When in a disturbed state the sun also emits streams of electrically charged particles which produce the auroral displays and a number of associated effects. These include disturbances of the compass needle which, when great enough, are known as magnetic storms, and disturbances of the ionosphere, particularly in polar latitudes. The marked concentration of the effect near polar latitudes is due to the influence of the earth's magnetic field on the streams of charged particles which produce the phenomena.

The frequency with which the sun is in a disturbed state and the intensity of the disturbance varies in a roughly periodic fashion over an 11-year cycle. We are now approaching a period of minimum solar activity and preparations are being made for international collaboration in measurements to be made during 1964 and 1965, known as the International Years of the Quiet Sun (I.Q.S.Y.).

Although most of these atmospheric phenomena have been investigated for many years prior to the introduction of space research techniques, using ground-based equipment only, there are many important aspects which can only be studied if measuring instruments are sent up to the high altitude concerned. The most important is the measurement of the intensity and wavelength distribution of solar radiation before it enters the atmosphere. Those constituents of the radiation which produce the upper atmospheric phenomena are absorbed in the process and so do not penetrate to ground level. This includes ultra-violet light, X-rays, infra-red rays, and long radio waves, as well as charged particles when the sun is in a disturbed condition.

Many other aspects of the upper air can only be studied through space-research techniques. These include the composition of the charged particles in the ionosphere, the location of the electric currents in the ionosphere which produce the regular variations of the compass needle, as well as those which circulate during magnetic storms, the variation of the intensity of different radiations in the air-glow with height, the composition of the air at heights above 20 miles, and so on. In addition, the pressures, density, temperatures, and wind distribution can be studied more directly, in much greater detail, and up to much greater altitudes than is possible if one is confined to the use of equipment on the ground.

Meteorological Studies.

Instruments outside the atmosphere can make systematic observations on a world-wide basis of the atmospheric circulation, through observation of cloud cover and of the thermal radiation into space from the atmosphere. Such observations are of great importance for meteorology. For example, in 1961, the development of a hurricane in mid-Atlantic was first detected by an American weather satellite, one of the *Tiros* series which have since been used semi-continuously for Weather Bureau routine forecasts. Similar work is being carried out by the Russians with their *Cosmos* series of geophysical research satellites.

Study of Interplanetary Space around the Earth

Direct observations may be made of the distribution of magnetic field, and of the composition and energy distribution of the neutral and charged matter present in the space outside the earth's atmosphere. This region is by no means empty, and includes zones of high concentration of particle radiation, extending out to distances of several earth radii. The systematic study of these radiation zones, which are connected with solar variability through the emission of solar corpuscular streams, forms an important branch of space research. In fact, the very existence of these radiation zones was discovered only through space research.

The Figure of the Earth.

The orbit of an artificial satellite vehicle is determined by the gravitational pull of the earth, together with the effect of air resistance. As the latter effect may be separated out, it is possible, from precise observations of the orbit, to obtain information about the earth's gravitation. This in turn depends on the shape of the earth, which may therefore be studied in a new and effective way.

Study of the Physics of the Moon and Planets.

Many important questions can be answered by means of probes sent to the neighbourhood of the moon and planets These include the measurement of the magnetic fields, if any, of these bodies and, for the planets, the study of their atmospheres, much of which can be done without actually penetrating to the surface With instruments landed gently on the surface it is possible to investigate surface conditions and composition by many methods Information on these questions can be obtained by photography and subsequent transmission of the picture back to earth by some form of television scanning.

Further Applications in Astronomy.

The possibility of observing solar radiation at all wavelengths from outside the atmosphere applies also to the radiation from other celestial objects, such as stars, nebulæ, and interstellar matter. Astronomical observations from the ground are confined to a study of the emission of visible light or of radio waves with wavelength between 1 cm and 30 metres No other radiation can penetrate the atmosphere With instruments operating outside the atmosphere the choice of radiation in which to observe is, in principle, unlimited, so that X-ray and ultraviolet astronomy becomes practicable

The Nature of Gravitation.

The nature of the force of gravity is not properly understood. This is partly due to the fact that gravitational forces are very weak unless at least one of the interacting bodies is very large The scope for experiment in this direction is extended very much if test bodies can be launched to come under the influence of different bodies in the solar system It is possible also to test certain predictions of the General Theory of Relativity, which is the only theory at present extant which attempts to interpret gravitational forces in terms of more fundamental concepts.

Biological Studies

One of the key problems in general biology is that of the uniqueness of life It is very unlikely that anything remotely resembling life can have developed on the extremely hostile environment of the moon but this does not apply with such force to the nearer planets, Venus and Mars It has been reported that microscopic particles resembling algae have been found in meteorites By using space vehicles launched into orbit which pass close to, or land on, these planets it is possible to investigate this important question The problem is complicated by the need for complete sterilisation of the equipment used so that evidence of life does not stem from terrestrial organisms It is also most important that the first material to reach the surface from the earth does not spread contamination from micro-organisms so as to make it impossible to study the natural biological conditions on the planet concerned

In addition to this work, use has been made of the environment within a space vehicle to study biological phenomena under conditions of zero gravity Most other conditions which prevail in space can be simulated sufficiently closely in terrestrial laboratories.

Techniques of Space Research.

The major technical problems involved in space research are:

(*a*) Launching of the instrument-containing vehicle with the necessary velocity

(*b*) Guidance and control of the vehicle so it pursues the desired path

(*c*) Tracking the vehicle to determine its actual path and the position on the path at any time

(*d*) Transmission of the data, recorded by the instruments, back to the earth

(*e*) Satisfactory operation of scientific instruments in the environment within the vehicle.

(*f*) Provision of adequate power supplies to operate the equipment within the vehicle for sufficiently long periods.

Types of Vehicle.

It is important to distinguish three distinct types of vehicle—the vertical sounding rocket, the artificial earth satellite, and the deep space probe The track of a vertical sounding rocket is mainly vertical, and the whole path to the highest point and back is traversed in a few minutes only An earth satellite circulates in an orbit round the earth in the same way as does our natural satellite, the moon If it approaches the earth at any point within 100 miles of the surface the air resistance causes the path to spiral in so rapidly that the vehicle is burnt up by air friction within the dense atmosphere after the lapse of a few months only. It follows that artificial satellite vehicles are only useful as instrument containers if the distance of closest approach (the perigee distance) is not much less than 100 miles For the study of the properties of the atmosphere at lower altitudes down to the limit (20 miles) attainable by balloons, vertical sounding rockets must be used It is a great advantage for work at higher altitudes to use satellites, as it is then possible to make systematic observations for months at a time from a great number of positions relative to the earth The successful space flights achieved by manned satellites also suggest that it should not be long before manned observatories become practicable

Deep space probes include vehicles which pass out to great distances from the earth and may leave the neighbourhood of the earth for ever to become artificial planets Such probes may pass close to the moon or planets or may merely pursue paths well out into interplanetary space

Launching Velocity.

The provision of sufficient launching velocity involves the use of rocket motors with adequate thrust To launch a satellite into an orbit circulating within a few hundred miles of the surface a velocity of 18,000 m p h must be imparted This may be done by using a multi-stage launching system. When the first-stage motor has burned out it drops off, so that, when the second-stage motor ignites, it does not have to support the weight of the first-stage, and so on

If the launching velocity is increased to 25,000 m p h the vehicle will not return to the neighbourhood of the earth but pass out of the range of the earth's gravitational pull completely Unless the launching velocity reaches 100,000 m p h it will not escape from the sun and will become an artificial planet

To launch a near artificial satellite, the direction of projection must be correct to within 1° or so It is possible in this way to launch a body to make contact with the moon, though the tolerable launching errors are rather smaller—½° in direction, 60 m p h in speed, and a few minutes in time The problem of guiding vehicles to the near neighbourhood of the planets is much more difficult still, particularly as the distances of the planet from the earth at any particular time are not known to within 10,000 miles or so

It is however possible to continue to guide a vehicle along a chosen path, after all the launching stages have operated, by using radio signals from the ground to operate controls within the vehicle This technique was used with the American *Mariner II*, which was manœuvred by radio control so that it ultimately passed within 21,000 miles of the planet Venus

In general it is not possible to launch a body so that it becomes a satellite of another planet unless braking rockets are carried which can be fired at a suitable point within the planet's sphere of influence so as to reduce the satellite's speed sufficiently with respect to the planet

Tracking Methods.

Tracking the path of a space vehicle, such as a vertical sounding rocket or near earth satellite, is carried out by optical and by radio means For the latter purpose a radio beacon is included within the vehicle so that radio direction-finding may be used. Radio methods are particularly important for acquisition in the case of earth

satellites—the initial observation of the vehicle after it has been placed in orbit. Once this has been achieved, optical methods are more accurate

It is very difficult to follow deep space probes out to great distances by optical observations, as they become extremely faint objects Attempts have been made to overcome this by causing the vehicle to eject sodium vapour on suitable occasions when sunlit The vapour stream fluoresces a comparatively bright yellow in the sunlight and assists visual detection Most reliance must be placed on radio methods, but, even with these, the range of observation is limited by the faintness of the signal compared with background noise

Radio methods are also vital for the transmission of observed data back to earth This is done by converting the observations into electrical pulses which actuate a suitable radio transmitter so that it radiates a signal, in coded form, which can be received at a ground station and decoded The transmission of such a signal can also be remotely controlled by means of signals from Earth, as in the case of *Mariner II*, which was commanded to give data while it was passing Venus These transmissions, at a distance of 36 million miles, are of the longest range so far achieved, but there seems to be no reason why greater communication distances should not be achieved in the future

Instruments.

For satisfactory operation of the instruments within a satellite or space probe the internal temperature must be maintained within fairly narrow limits This may be done by suitable coating of the surface of the vehicle, as the temperature is largely determined from a balance between the adsorption and emission of radiation Automatic thermostatic controls may be used as an alternative, in which shutters are opened or closed to include or exclude solar radiation Instruments must be robust enough to withstand launching shocks and vibration and be capable of operation, without maintenance, for long periods

Conventional batteries may be used as power sources, but for a long lifetime their weight becomes excessive Solar cells, which convert solar radiant energy into electrical power, are now being used, but some form of storage battery is still needed in order that power should be available when the vehicle is not in sunlight Also, a need for alternative supplies can arise as a result of the passage of a satellite through the belts of intense radiation which exist near the earth (Van Allen Belts) These can cause damage to instruments and particularly to solar cells Other alternatives include radioactive batteries, and, in anticipation of the power demands of large satellites, a nuclear reactor has been launched into orbit

Scientific Results Obtained.

The Solar Radiation.

In the visible region the sun radiates as if it were a black body at a temperature of 6,000° K (Absolute zero on the Kelvin temperature scale is approx. −273 15° C) It has been found from observations with equipment in vertical sounding rockets that the intensity of solar radiation in the near ultra-violet is less than would be expected for such a body Thus, at a wavelength of 2,400 Å (Angstrom = 10^{-8} cm), the intensity is that which would be radiated by a body of the size of the sun at a temperature of 5,000° K This tendency becomes more marked as the wavelength decreases until wavelengths of about 1,200 Å are reached For smaller wavelengths there is evidence of an increased effective temperature This becomes very marked for X-rays with wavelengths below 50 Å The intensity of these rays emitted by the sun very greatly exceeds that which would be emitted if it were a body at the effective temperature of 6,000° K.

Photographs of the solar spectrum down to wavelengths of 500 Å, have been obtained, and the disc of the sun has been photographed in Lyman α radiation (wavelength 1216 Å.) in both areas using equipment in vertical sounding rockets.

Much work still remains to be done before the normal intensity emitted by the sun at all ultraviolet wavelengths has been accurately measured. The study of the variability of the radiations has only just begun When a violent disturbance or flare occurs on the sun there is an increased emission of short X-rays

Particle radiation from the sun is discussed below under the heading of " Radiation Belts."

Atmospheric Structure.

The pressure, density, temperature, and wind distribution in the atmosphere up to altitudes of 100 km or so has been investigated at White Sands, New Mexico, at Fort Churchill, Canada, at Woomera, Australia, and at several locations in the Soviet Union, using vertical sounding rockets.

Pressure and density have been measured using pressure gauges located at suitable places on the shell of the rocket Soviet investigators have made direct temperature measurements using resistance thermometers, but in other countries the temperature distribution has been obtained indirectly by deriving the speed of sound as a function of height This is done by a sound-ranging method in which grenades are ejected at regular intervals from a rocket, to explode at a distance of 50 ft or so from its trajectory. The grenade explosions are located in space by photography and in time by recording the times of arrival of the light from each flash at photo-electric detectors on the ground Finally, the times of arrival of the sound pulses from each explosion are recorded by an array of microphones. From this information it is possible to derive not only the mean speed of sound through the atmosphere between successive grenade explosions but also the mean east–west and north–south wind speeds

Results have confirmed the general nature of the variation of temperature with height which had been deduced from ground-based or balloon-assisted studies. Much more detail has been obtained, but it is still not certain whether daily or seasonal effects can be discovered. Many more observations are still required.

Direct measurements at higher altitudes are much fewer in number and limited almost entirely to use of pressure gauges for determination of density Information at altitudes above 200 km. is available from observation of satellite orbits.

Air resistance causes the period of revolution of a satellite to decrease gradually at a rate which depends on the air density at the perigee (the closest point of approach to the earth's surface). If the dimensions of the satellite are known it is possible to derive the air density from the observed rate of change of period at any time Results have been derived in this way out to altitudes of 700 km , where the density is about 2×10^{-18} of that at ground. The associated temperature comes out to be as high as 1,000° K Marked irregular variations of density seem to occur, one component of which seems to be correlated with solar activity No diurnal and seasonal effects are clearly distinguished This seems to be in conflict with the highest altitude, vertical-sounding rocket data, which exhibits strong diurnal and seasonal variations

The Ionosphere.

A great deal of new information about the ionosphere has been obtained by the use of instruments in vertical sounding rockets The variation of electron concentration with altitude has been studied in detail on many occasions, even under conditions in which no radio transmission over long distances from the ground was possible. Such conditions occur quite frequently in polar regions due to downward extension of the ionosphere

Information about the way the ionosphere fades off at heights above 200 miles from the earth, which cannot be obtained from ground-based observations, may be derived from precise observations of the radio signals from a transmitter in a satellite

which is circulating in an orbit extending to distances greater than 200 miles from the earth. This is only possible if the frequency of the radio signals from the satellite is not too high. The first Russian satellites used transmitters at suitable frequencies, and a great number of observations have been made of these radio signals, from which data have been obtained about the high ionosphere. Experiments have also been carried out with *Telstar*, a communications satellite which was mainly intended to provide a high frequency "reflector" to enable direct communications to be carried out by microwave radio between points on the earth separated by great distances.

The nature of the free positively-charged particles in the ionosphere has also been studied using mass spectrographs—instruments which determine the masses of the particles—flown in vertical sounding rockets. The rather surprising result has been found that, at altitudes below 100 miles, the main positive particles are ions NO^+ of the molecule nitric oxide, rather than ions (O^+, O_2^+) of oxygen or (N^+, N_2^+) of nitrogen. At much greater height the chief positive ion is that of atomic oxygen, according to observations made with instruments in the third Russian satellite.

Many more investigations are in progress using instruments in vertical sounding rockets and in satellites which are designed to study every aspect of the ionosphere, including the mean energies of the electrons.

The Figure of the Earth.

Much more detailed information than hitherto has become available about the shape of the earth from precise observations of the orbits of the first satellites. This is because the force exerted by the earth on a satellite depends on the figure of the earth. Although it has been known for a long time that the earth is not exactly spherical but is flattened at the poles, satellite studies have shown that the amount of flattening is not exactly that previously assumed. It is usually given in terms of the ratio, $(a - c)/a$, of the difference between equatorial and polar radii to the equatorial radius. The value of this ratio was taken to be 1/297.1, but analysis of the data obtained from satellite orbit observation shows that it should be 1/298.21.

It has been found also that the earth is slightly pear-shaped, with the stalk towards the north pole. The scale of this effect is such that the south pole is 100 ft. nearer the centre of the earth than the north pole.

Much more detailed information will be obtained from further, more accurate, observations of satellite orbits.

Additionally, much more precise information can be obtained of map distances by simultaneous observations from three or more ground stations of the position of a satellite. In order to make such observations practicable, the satellite *Anna B* was launched by the Americans at the end of 1962. This satellite is equipped with a discharge lamp which gives light flashes of short duration but very high intensity.

The Radiation Belts.

The first two satellites launched by the U.S.A., *Explorers I* and *III*, carried counters to observe the intensity of cosmic radiation. Although this radiation is composed of very energetic positively-charged particles, the counters were also responsive to much less energetic particles. The first results were perplexing. When the satellites were within a few hundred miles of the earth's surface the counters recorded just the intensity expected of the cosmic rays at that height, but no particles were recorded when the satellite receded to distances of 600 miles or more. This behaviour was repeated through many cycles of revolution of the satellites. As nearly all the cosmic rays originate outside the solar system, their intensity could not have fallen to zero at the greater distances of observation. Instead, van Allen suggested that the intensity of radiation is actually so high at these distance that the counters were unable to follow it. He verified by laboratory experiment that this would indeed happen if the intensity exceeded that of the cosmic rays by more than 10,000 times.

This explanation was confirmed by including in the next American satellite, *Explorer IV*, counters which could respond to the high intensity. Meanwhile, equipment for studying particle radiations was included in the third Russian satellite *Sputnik III*. The orbit of the satellite passed over rather higher latitudes than did those of the *Explorers*, and evidence was obtained that at these latitudes the region of intense radiation penetrates close to the earth. It was also established that the particles involved were much less energetic than cosmic rays.

The next big discovery was made with counters in *Pioneer I*, the space probe launched by the U.S.A., which reached a distance of 71,000 miles from the earth before returning to burn up in the atmosphere. Here counters showed that there were two zones of high intensity of particle radiation, one concentrated at a distance of 1,000 miles, the other at a distance of about 15,000 miles. There seems no doubt that a close relation exists between the shapes of the regions and the earth's magnetic field. The inner zone is confined to relatively low latitudes, while the limits of the outer zone follow closely the magnetic lines of force of the earth's field, so that at high latitudes it approaches much nearer the surface. The closest approach is at latitudes where auroral displays are most frequently seen.

Trapping of electrically charged particles by the earth's magnetic field was predicted as long ago as 1913 by Störmer, on the basis of theoretical calculations. Such particles can be released by collision with other particles or by fluctuation of the magnetic field. It is therefore necessary that a source or sources of charged particles be available to make up for loss in this way. It is considered that the outer zone is maintained through replacement by irregular emission of charged particles from the sun. This is consistent with the observations from the counters in *Pioneer IV*, the American space probe which passed the moon to become an artificial planet. This vehicle was launched during a period of solar disturbance, and the intensity in the outer belt was found to be much greater than during the flight of *Pioneer I*, which took place during a quiet phase of the sun. It is also consistent with the observations from Russian equipment in their first lunar probe, which showed that the charged particles in the outer belt are of relatively low energy compared with those of the inner belt.

This belt is considered to be maintained by secondary particles shot outwards from the atmosphere due to impact of cosmic rays on the nuclei of atmospheric atoms.

Artificial radiation belts were created on three occasions during 1958 by exploding rocket-borne atom bombs (of conventional type) at a height of 300 miles in the atmosphere above the South Atlantic. Charged particles produced in the explosions were trapped by the earth's field to form a belt about 60 miles or so thick around the earth between the two natural zones. These artificial belts lasted for five days or so, during which time they were observed by the counters in the satellite *Explorer IV*.

Considerable protest arose from scientists, especially astrophysicists, with the explosion of a large (1½ megaton) nuclear device by the U.S. Atomic Energy Commission at an altitude of 250 miles in July 1962. The radiations given off by this explosion put several satellites out of operation as a result of damage to their solar cells.

Additionally, it appears that the radiation belt created by this explosion will persist for much longer than predicted by American experts, and to some extent will impair astrophysical measurements being made by radio astronomers.

The Moon.

The second Russian lunar probe, which succeeded in hitting the moon, contained a magneto-

meter to observe any lunar magnetism This operated to within 50 miles of the surface, but recorded no magnetic field, suggesting that the moon cannot have any appreciable magnetism. Supporting evidence is provided by the failure to observe any zones of intense particle radiation around the moon due to trapping by a lunar magnetic field.

The third Russian lunar probe passed behind the moon and took photographs of that part of the lunar surface which is never visible from the earth These photographs were automatically processed and then scanned for electrical reproduction The results of the scan were transmitted by radio signal, on command from the earth, at the next point of closest approach of the vehicle to the earth From these data the picture was reconstructed on the earth, showing for the first time some of the hidden features of the moon

Rocket Astronomy

The first observations of the northern sky in ultra-violet light were made in 1957 with instruments in a rocket launched to a height of 90 miles from the U S A It was found that the regions of greatest intensity of the ultra-violet rays concerned (wavelength 1,300 Å.) did not all coincide with the brightest regions in visible light

THE FIRST BRITISH SATELLITE—ARIEL

Space Research in the United Kingdom

Space research in the United Kingdom started in 1954 under the auspices of the Royal Society's High Atmosphere Committee and with a government grant of £100,000 over the ensuing four years Half of the money was available for the five university groups, which immediately became active, and half provided a contribution to the cost of installation of the instrumentation and firing of *Skylark* rockets from Woomera The first of these solid propellant rockets was fired in 1957 and since that time *Skylark's* capability of carrying 150 lb of payload to heights up to 280 km has provided the backbone of British Space Research

At the end of the initial four-year period and with the launching of artificial satellites by Russia and America a new administrative structure became necessary The British National Committee on Space Research—a Royal Society body under the chairmanship of Sir Harrie Massey—now has the responsibility for allocating funds for scientific research in space from a grant made by the Treasury to the Department of Scientific and Industrial Research This grant is quite insufficient to enable the United Kingdom to build or purchase satellite launching rockets

A U S. U.K Co-operation.

It was therefore greatly welcomed when the British National Committee received from the American Academy of Sciences an offer to provide the means of launching a small satellite into a near earth orbit and to undertake the engineering of the basic structure of the satellite and the recovery of the data by telemetry.

Preliminary discussions were held in Washington in June 1959 and in February 1960 the payload of the first British satellite was agreed The primary aim of the satellite was to study the upper regions of the ionosphere and the solar behaviour at the same time An additional unrelated experiment set out to measure the flux of heavy primary cosmic rays (with nuclear charge greater than 5 electronic charges) and also to monitor the much greater flux of protons encountered both within and below the van Allen radiation belts The groups involved, from the Departments of Physics at Leicester University, Imperial College and University College London, and from the Department of Electron Physics, Birmingham, had all had previous experience in rocket instrumentation In addition to the work at the universities a significant technical contribution and some economic assistance came from British Industry.

Orbital and Payload Details.

The satellite, named *Ariel* by the Prime Minister, after its successful launching at Cape Canaveral on 26 April 1962, was placed in an orbit having an inclination to the equator of 55°, an apogee of 1200 km, and a perigee of 400 km. One experiment, aimed to measure the intensity of the characteristic radiation from excited solar hydrogen atoms (known as H Lyman-alpha at a wavelength of 1215 Å) failed on launch (1 Å = 10^{-8} cm) The remaining instrumentation consisting of nine sets of measurements all operated satisfactorily and most of it continues to do so at the time of writing (March 1963)

Initially, data from most of the experiments were recorded on an internal tape recorder so that a complete time coverage was obtained when the tape was read out at high speed on radio command once per orbit. Since the explosion of a high altitude nuclear device on 9 July 1962 the satellite has suffered a shortage of power, presumably due to radiation damage to the solar power supply which provides the 5 watts required for the instrumentation The tape recorder has ceased operation and from time to time the satellite shuts down its instrumentation to enable the internal batteries to be adequately recharged

The Scientific Instruments.

1 Cerenkov detectors employing multiplier photo-electric cell to detect the light produced by heavy cosmic rays moving very fast through a dielectric measured the charge carried by the rays

2 Geiger counters detected the ionisation produced by fast protons, thus measuring their flux

3 A small electrode at the end of a long boom was immersed in the ionised upper air The relationship between the current to this electrode and the voltage applied to it was obtained A device like this is called a Langmuir probe, after an early investigator of ionised gases, and its readings were interpreted in terms of the concentration and energies of the particles

4 A similar probe in the body of the satellite enabled the effect of the disturbance of the ionosphere by the satellite itself to be investigated

5 An ionised medium has a dielectric constant less than unity at radio frequencies (The dielectric constant is a property of matter that affects a measurable quantity called electrical capacitance) The effect of the ionosphere on the electrical capacitance between a pair of electrodes mounted on another boom was used to obtain the concentration of electrons in the ionosphere

6 A satellite moves much faster than most of the positive ions in the ionosphere The energy with which they impact the satellite is thus a measure of their mass. A spherical Langmuir probe surrounded by a grid to eliminate the electrons was used to find the energy and hence both the masses and temperatures of the ions present

7 The energy of the solar X-rays was measured by the ionisation they produced in a proportional counter

8 The angle between the direction of the sun and the spin axis of the satellite together with the spin rate and phase of rotation were determined by a system of photo-cells and suitably shaped slits.

Some Important Results.

The data from a satellite like *Ariel* amounts to many millions of samples Electronic handling is thus essential if maximum use is to be made of it The following are some of the main conclusions that can already be drawn

Several X-rays spectra have been obtained during solar flares Very soon after the onset of a visible flare the spectrum in the region of 5 Å wavelength increases in intensity by a factor of

around 100, a value comparable to the intensity at three times this wavelength. The intensity around 15 Å changes by a much smaller factor of order two or three. It is this huge increase in the more penetrating X-ray flux that results in ionisation at the lowest level of the ionosphere with its associated absorption of radio waves passing through the region. This data confirms and adds significantly to data earlier obtained by rockets.

The measurements of electron density and temperature and of ion constitution all point to an important control of the conditions above the level of maximum ionisation in the ionosphere by the magnetic field of the earth. Regions of increased ionisation which appear to be aligned along the lines of magnetic force have been found. Similarly the temperature variation of the electrons follows a pattern that appears to correlate with the earth's magnetic field so that the lines of force are roughly isothermals. The temperature of the electrons increases with height and with latitude and varies diurnally. It may be postulated that the high latitude heating is due to particles from the van Allen radiation belts and that the electron gas, which is not at the same temperature as the neutral gas, has a high conductivity along the lines of magnetic force.

The measurement of ion masses shows the upper ionosphere to be stratified into three layers in which the dominant ions are those of atomic oxygen, helium, and atomic hydrogen at successive altitudes. As is to be expected, the lighter ions are dominant at the greater heights and the altitude of transition from one layer to another varies diurnally in a manner consonant with the heating and cooling of the atmosphere.

The satellite *Ariel* must be regarded as a most successful venture. Work is progressing on two successors.

RADIO ASTRONOMY.

The new branch of science called radio astronomy explores the universe at entirely different wavelengths from those used in conventional astronomy, and the discoveries, not surprisingly, have given us many unexpected and valuable insights into the structure and evolution of the universe. The wavelengths used so far are those which can penetrate the earth's atmosphere and ionosphere and range from 1 centimetre to 30 metres. When radio telescopes can be mounted on satellites above the earth's atmosphere this range will be extended further in each direction.

Radio astronomy should not be thought of as separate from optical astronomy which is mainly concerned with the wavelengths the eye can sense. Only by co-ordinating observations taken at all wavelengths which will in the future include infrared, ultraviolet and X-rays can the phenomena of the heavens be fully understood.

The Beginnings of Radio Astronomy.

In the years 1931 and 1932 Karl Jansky was working with the Bell Telephone Laboratories in New Jersey studying the sources of radio interference which from time to time interrupted communication circuits at a wavelength of 15 metres. He found that some of the interference was from thunderstorms while another contribution was from outside the earth's atmosphere and was situated in the Milky Way. It seems strange now that this startling new discovery did not attract much attention in astronomical circles, and it was left to Reber, a radio amateur, to confirm this result in 1938 at a wavelength of 2 metres.

The war stopped further immediate progress in the new science although it provided powerful techniques which were to allow fast growth soon after. Sensitive radio receivers and large aerials were constructed and the technique of radar was developed. Radar, which can be used to determine the distance and speed of a distant object by measuring the time taken for a transmitted radio signal to be reflected back to the observer, was later to play a big part in radio astronomy in the exploration of the planetary system. In the last years of the war radar operators obtained echoes from meteors and were able to detect radio signals emitted from the sun during vast explosions in the sun's atmosphere. These discoveries set the scene for a rebirth of the science in 1946.

The Instruments of Radio Astronomy.

In modern optical astronomy the light from a distant star is brought to a focus by a large mirror of parabolic shape and there it is viewed by the naked eye or photographed on an emulsion sensitive to light. In radio astronomy the observing technique is closely analogous. Radio waves from a distant source are brought to a focus by a large parabolic reflector, the parabola has the geometrical property that parallel light reflected from its surface passes through the focus. But as our sense organs do not respond to radio waves we have no opportunity of seeing the radio sky as we would in an optical telescope and so a radio wave detector is placed at the focus. This consists of a dipole tuned to the wavelength required which then feeds the radio energy into a receiver where it is amplified and finally converted into a form which can be sensed, as say a detected signal on a loudspeaker or a deflection of a recording pen.

The diameter of parabolic aerials may be several hundred feet. The giant steerable radio telescope at Jodrell Bank is 250 ft in diameter and the moving parts weigh more than 2,000 tons. A large parabolic trough aerial at Cambridge which is movable in elevation only is 1,450 ft long and 65 ft across. The continual trend towards larger aerials is the result of a desire to obtain better resolution or ability to distinguish detail in the sky. An aerial with a diameter of 25 ft operating at a wavelength of 20 cms accepts radio waves entering it within a cone of angle 1.8° whereas the 250 ft reflector at Jodrell Bank has a beamwidth of 12 minutes of arc and is therefore able to see detail 10 times smaller. It will see objects 100 times fainter because it has a collecting area 100 times greater than the smaller aerial.

The range of a given aerial as a radar instrument is directly proportional to the power of the transmitter. Today radar pulses of up to 10 million watts peak power are transmitted towards the moon or the planet Venus and are successfully reflected back again. New sensitive receivers developed in the last few years greatly help in the detection of the weak signals radio astronomy is continually wrestling with.

Another system quite distinct from the pencil beam aerials just described is the interferometer which consists of two spaced aerials. The signals received from them are added together and when suitably interpreted give the diameter and the position of radio sources. The results are particularly important for making identifications and for the study of cosmology.

Radar Astronomy.

Radar echoes were first recognised from celestial objects during the V2 raids on London in 1944 when echoes were obtained from meteors which travelled 10 times faster than the rockets. The meteors themselves only rarely give echoes and it is generally only the hot ionised trail they leave behind which acts as a radio reflector. This trail normally lasts less than a second before the electrons and positive ions have recombined and the gas becomes neutral and is again unable to reflect radio waves.

Radar quickly contributed much to our knowledge about meteors. Many day-time meteor showers were discovered because of course they had until that time been invisible optically against the glare of the sun. A more careful check was kept on known showers because counts of echoes gave an accurate estimate of the density of meteors in the showers from year to year.

The first meteor shower studied by radar was the Giacobinid shower of 1946, one of the most spec-

tacular of the century. It has only recently, perhaps during the last 100 years, separated from its parent comet and is therefore a very dense and compact shower. On the other hand, the daytime showers, the β-Taurids and the ζ-Perseids, are very old and diffuse and in fact the meteoric debris is scattered in a broad band the whole way around the orbit of the parent comet.

The moon is an obvious target for radar and measurable echoes can be obtained with moderate sized aerials and transmitters. Radio waves travelling at 186,000 miles per second take 2½ seconds to make the round journey to the moon and back. The echoes are not of constant intensity but show irregular fading due to two reasons. The first is that, because of the relative motion of the earth and the moon, the moon is continually presenting different echoing areas to the earth. The other fading is slower and is due to effects in the earth's ionosphere.

The moon has often been thought of as a reflector in long distance high-frequency communication around the earth. Careful measurements of the reflected signal from the moon showed that this was not practical because the echo was made up of several components coming from different echoing areas. A large fraction comes from the nearest part of the moon which we see as the centre of the disk and the rest comes from areas which are of 100 miles or so further away. Because of the finite speed of electromagnetic radiation the information (modulation) superposed on the transmitted waves will be blurred over the time interval it takes the waves to go the furthest distance from the front of the moon and back again. As the highest modulation frequency which can be used via the moon is about 10 kilocycles, television, for example, cannot be relayed in this way.

The next step from the moon was to the planet Venus which comes within 25 million miles of the earth. The difficulties involved can be gauged when it is realised that the strength of the echo is inversely proportional to the fourth power of the distance. Even with the most powerful transmitters and the largest aerials it is only possible to detect the extremely faint signal from Venus by adding up the returned signal over periods of several hours. This was successfully accomplished during the near approach of Venus for the first time in April 1961 by groups in Great Britain, U.S.A. and U.S.S.R. It was found that the reflecting properties of Venus were much like those of the moon, indicating a rough terrain. Also the experimenters were convinced that the planet rotates on its axis very slowly thus having a day equal to about 200 earth days.

Radio Waves from the Sun

The sun presents a very different picture at radio wavelengths from the picture we are familiar with in the visual band. It is constantly changing, sometimes increasing a million-fold in brightness within a few seconds. Its irregular outline contains bright patches which immediately show that the great gaseous ball is rotating. The complex riddle of the sun's activity is gradually being unravelled and it can conveniently be divided into three components, the *quiet sun*, the *slowly varying* component, and the *burst* component.

The *quiet sun* is characterised by a steady level of radio emission such as occurs when there is no activity on the sun, that is no sunspots or flares. Radio waves are generated in the hot gases of the sun's atmosphere and since the longer radio waves can only escape from the higher levels the sun at these wavelengths is larger than at shorter wavelengths. For example, at 4 metres wavelength the observed diameter is 1° while at 3 cm it is 0°.5 which is the optical value. Another consequence of the higher origin of the metre wave emission is that the sun is much hotter at these wavelengths, giving temperatures of a million degrees which are characteristic of the solar corona.

The *slowly varying* part of the sun's activity is associated with the regions near sunspots and its intensity is closely correlated with the sunspot cycle, having been a minimum in 1954 and a maximum in 1959. Sunspots are the most obvious indicators of solar activity lying on the visual surface of the sun. However the phenomena are much more extensive and penetrate deep below the sun's surface whence the energy is supplied and also as far up as the corona where coronal plumes appear. The slowly varying component is limited to wavelengths below 1 metre. It consists of hot areas rather like a pancake in shape lying perhaps 50,000 km above and parallel to the sun's visible surface. Each hot area has a life span of weeks to months and often antedates and outlives much of the optical activity.

The most spectacular display in the sun's repertoire is the *burst* in which the emission may suddenly increase a million times above the quiet sun level. Since the burst comes from an area of only one thousandth of the sun's surface the radio energy is very large and cannot be thermal emission from a hot gas as described for the previous two components of activity. It originates in the passage of fast moving charged particles through the sun's atmosphere and the high magnetic fields found there. Several ingenious techniques have been devised which have been able to follow the burst through the sun's atmosphere. Two characteristic speeds have been measured. One is 1,500 km/sec. which is well known as the speed with which charged particles leave a solar flare and one day later reach the earth where they produce aurorae and magnetic storms. The other is a speed of about one third of the velocity of light and is supposed to be associated with the emission of cosmic rays from the sun. No other optical or radio feature is as spectacular as the ejection at the time of flares of these radio fireballs from the solar surface and their subsequent return after reaching heights of several solar radii.

The Planets

The planets were not expected to be very spectacular radio sources as they are cold solidified satellites of the sun having no hot gaseous envelope like the sun which is responsible for its strong emission. Mars has a surface temperature of 200° K at radio wavelengths which agrees well with that expected from optical measurements. The moon likewise has a temperature near 200° K and there is in addition a variation in temperature with the lunar cycle at wavelengths shorter than 10 cm. The lack of variation at longer wavelengths arises because the radiation is emitted 10 cm or more beneath the surface where the heating due to the sun does not penetrate. Observations of Venus however brought to light an important new result. Its surface temperature is 650° K which is more than 300° higher than the value obtained optically. There is evidently a gigantic greenhouse effect operating in the carbon dioxide atmosphere of the planet which enhances the temperature of the rocky surface.

Apart from its thermal emission Jupiter has two other components which originate in its deep atmosphere. One is found at decimetre wavelengths and is tentatively associated with the van Allen belts (*see* F46 (1)) of the planet. The other is burst-like in nature and is most intense at about 20 metres wavelength. It appears to be due to electrical disturbances in the dense cloud layer 10,000 km deep which envelopes the planet.

The Milky Way.

An intense band of radio emission follows the line of the Milky Way around the sky. The light we know has its origin in the stars and we also know that the stars cannot emit enough radio waves to produce the observed effect. Early radio astronomers were faced with the problem of producing radio emission in the cold and tenuous regions between the stars. Interstellar cosmic rays although relatively rare are now believed to be the source of this emission as they spiral around the magnetic field lines in the Milky Way. This type of emission is generally called synchrotron emission since it is produced in synchrotons and

other particle accelerators As well as this part of galactic emission which is confined to the plane of the Galaxy there is also a spherical distribution of synchrotron emission surrounding the Galaxy like a huge corona It seems that the magnetic fields and cosmic rays extend far beyond the peripheral stars of the Milky Way.

Another type of emission which gives us much useful information about interstellar space is line emission from neutral atomic hydrogen at a wavelength of 21 cms , this is the only spectral line so far discovered in radio astronomy Measurements of neutral hydrogen spectra enable a detailed picture to be built up of the rotation of our own Galaxy Optical astronomy is unable to do this because of obscuration of the more distant parts of our Galaxy by interstellar dust which however does not effect radio waves The picture has emerged of a spiral galaxy which makes one rotation every 200 million years The hydrogen which is confined to the galactic plane is the material from which the young blue O and B stars are forming (These are recently formed and very hot stars) Condensations form in the cool hydrogen and dust clouds and these are the centres for star formation in the present epoch of the evolution of our Galaxy The sun lies within such a region containing 100,000 stars which have recently been formed within a huge gas and dust complex some 1,000 light years across

Radio Stars in the Milky Way.

The radio stars or " radio sources " are distributed throughout the sky in much the same way as their optical counterparts Some are confined to the band of the Milky Way and some are more broadly distributed We will pay particular attention to the former class, the galactic sources, in this section Radio stars have one basic difference from visual stars: they have angular diameter of about a minute of arc whereas the diameters of visual stars are measured in thousandths of a second of arc and are unresolvable in even the 200-inch telescope on Mount Palomar

The first radio star to be identified was the Crab Nebula which is the remnant of the supernova observed by Chinese astronomers to have exploded in A D 1054 (**F4 (2)**) Since this time the filamentary remnants have been flying out over a volume about 5 light years in diameter The filaments contain high magnetic fields which hold the cosmic rays ejected from the exploding star and make this faint optical object an intense radio emitter A number of other radio stars are supernova remnants Cassiopeia-A is the brightest in the sky and is one of the most recent to have exploded in the Galaxy The Cygnus loop on the other hand probably exploded 100,000 years ago and is now a faint object spread over a diameter of about 120 light years

Another group of radio stars is associated with the ionised hydrogen emission regions which surround many O and B stars They are most readily detected at short wavelengths where synchrotron emission is much weaker Among the nebulae detected are the familiar Orion, Rosette, North America and Trifid nebulae Data for some galactic radio stars are given in Table 1

Extragalactic Radio Stars.

The most common radio sources lying outside the Milky Way system are the normal galaxies which emit in much the same way as the Milky Way itself They are, however, very weak emitters and only the nearby galaxies have been detected A common property is their large size

TABLE 1 GALACTIC RADIO STARS

Name	Position (1950)		Intensity at 100 Mc/s. units of 10^{-24} w/m²/c/s	Angular diameter.	Identification
	Declination	R A			
Cassiopeia-A	+58° 32′	23h 21 2m	170	5′	Supernova remnant

Name	Position (1950)		Intensity at 100 Mc/s units of 10^{-24} w/m²/c/s	Angular diameter	Recession velocity	Identification
	Declination	R A				
Cygnus-A .	40° 35′	19h 57 8m	120	1 3′	0 056c	Interacting galaxies
Centaurus-A	−42° 45′	13h 22 4m	17	6′	0 0015c	Interacting galaxies
Virgo-A .	12° 41′	12h 28 2m	11	4′	0 004c	NGC 4486 Peculiar galaxy with jet
3C 295 .	52° 26′	14h 09 5m	1	0 08′	0 46c	Interacting galaxies most distant yet identified

Note Declination and Right Ascension (R A) are the coordinates of a celestial object.

Mc/s (= megacycles per second) is the unit of frequency used in radio

w/m²/c/s (= watts/metre²/cycle/second) is the unit of power received on the Earth from a radio source

Many celestial nebulous objects were catalogued by Dreyer in his New General Catalogue (N.G.C.). The number of the object is prefixed by the letters "N G.C."

3C 295 is radio source number 295 in the third Cambridge list of radio stars.

The recession velocity of a source is given as a fraction of " c ", the velocity of light

compared with the associated visual galaxy Again radio waves are being generated in the very extensive magnetic fields by wandering cosmic rays

Much is now being learnt about the evolution of galaxies from studies of their neutral hydrogen line radiation which enable the distribution of hydrogen to be mapped and compared with that of the stars Clear differences between different galactic types were immediately observed The Magellanic Clouds which are irregular young systems contain some 30% of their total mass in the form of neutral hydrogen while an older system like the spiral nebula M 31 in Andromeda contains only about 1% neutral hydrogen A clear difference is found between different parts of a given galaxy For example, in the central regions of M31 which is populated by very old stars there is no hydrogen whereas in the outer regions there is more hydrogen than stars The hydrogen in the central regions condensed into stars long ago and hydrogen in the outer parts is still in the process of condensation

One of the most exciting discoveries of radio astronomy was that many of the radio sources are very powerful and distant objects The second brightest, called Cygnus-A, has a redshift of 16,800 km per sec and is therefore at a distance of 600 million light years It is identified with two interacting galaxies where intense radio emission is generated in the holocaust An even more distant radio star has recently been identified with another interacting pair of galaxies having a redshift of 140,000 km /sec and is thus at a distance of 4,000 million light years These observations open the way to a study of cosmology, the study of the large scale structure and evolution of the universe, because the radio waves we now detect from the furthest radio stars began their journey thousands of millions of years ago and provide a method of studying conditions at that early epoch Observational cosmology is only in its infancy and it is expected that radio astronomy will play an important part in it.

PROGRESS IN WEATHER FORECASTING

Interest in weather forecasting must have begun in prehistoric times with the earliest glimmerings of human intelligence when we may suppose that men first became conscious of a past and a future and recognised that comfort and livelihood depended on the vagaries of wind and rain and sunshine So it is that modern weather forecasting, unlike many innovations of the present scientific age, unlike for example air transport or radiocommunication or electric power or atomic energy, has no recent beginning but has been developed over the last hundred years against an ancient background of folklore and superstition with origins lost in antiquity Not all such traditional belief is ill-founded, far from it, but it is so mixed up with wishful thinking and poetic imaginings as to afford little guidance to the future Yet it loses ground but slowly and we do not need to go to primitive peoples in backward countries to find those who look for the weather to change with the moon, although the causal connection, if any, is very slight, or put great store on the berries in the hedgerow or the behaviour of the birds as though the plants and dumb animals had a prescience of the coming winter, for which there is no evidence whatever Professional weather forecasters are still lovers of nature, they regret more than most the passing of the old poetic fancies and take delight in justifying from science some old saw such as "red sky at night, the shepherd's delight" or "long foretold long last, short notice soon past", but they know they are fated to drive most of these things out of currency as surely as electricity has driven out the tallow candle

The Growth of Meteorology.

Modern meteorology grew, as did modern science in gènerał, from the 17th cent onwards, with the conviction that the winds and the weather were merely the natural behaviour of the atmosphere surrounding the earth responding to the heat of the sun and other influences The response is certainly complicated but it was realised that it must nevertheless be ultimately explicable in terms of the laws of dynamics as originated by Newton and the further laws of physics, particularly of thermodynamics, which later scientists discovered and refined But to study the ways of an atmosphere covering millions of square miles and extending far beyond the tops of the highest mountains was a task demanding wide resources, funds and technical instruments, and above all communications, not to mention scientific brain-power Progress in forecasting in recent years has depended on all these things During the last thirty years or so the number of scientists employed in the study or practice of meteorology has increased ten fold, the cost of all the weather forecasting services all over the world is now some £100 million per year, instruments of growing sophistication have been brought into use on a large scale and the communications network employed for the exchange of weather information, the most elaborate specialized network in the world, is growing every year Some account of this progress is given in the following paragraphs

The Basis of Forecasting.

The basis of weather forecasting can, in its barest essence, be stated in a few simple words It is to study what the weather is and how the atmosphere is behaving over an area extending some hundreds of miles and often thousands of miles from the centre of interest, to note the ever-changing pattern of weather over this area mainly by constructing cartographical weather maps—a kind of ordnance survey of the varying weather and to carry the changes over into the future by extrapolating trends, by using wisdom born of experience, or by carrying out methodical calculations according to scientific principles Whatever the methods, the collection of the data from the large area and at frequent intervals is the foundation of the system so that good communications are of the essence.

Progress in Weather Communications.

The meteorological telecommunications network (radio links and land-lines) has been developed solely for the exchange of weather information by international agreement within the World Meteorological Organization, a specialised agency of the United Nations to which virtually all the countries of the world belong The network today does in fact extend to all parts of the world, literally from pole to pole, wherever weather observations are being made, so that, if it were necessary, it would be technically possible to obtain in England information on the weather of Antarctica within a matter of minutes several times a day Actually, at present, we do not in Britain attempt a rapid and complete world coverage as data for only the Northern Hemisphere are sufficient for immediate purposes The main communications centre for the United Kingdom is at the headquarters of the Meteorological Office at Bracknell Berkshire, where the collection, collation and retransmission of weather messages continue according to strict schedules, day and night throughout the year The communications room contains over 80 teleprinters with direct land-line or radio connections to our national forecasting centres and to many centres oversea The messages are in five-figure groups coded according to an international system so that the information on wind, weather, temperature, cloud and so on contained in a message is as intelligible in Tokyo or Moscow as it is in London or Washington Almost a million figure groups are handled at Bracknell every day The world coverage of coded messages by teleprinter is now supplemented by a growing exchange of completed weather charts, including forecast weather charts for a day or more ahead, using facsimile equipment for telegraphic transmission By this means the forecaster at an outstation in Britain receives pictures showing the weather maps as drawn at the head office in Bracknell while the forecasters at Bracknell have the advantage of knowing the opinions of their colleagues in America and elsewhere

Progress in Weather Observing and Instruments.

Most of the basic weather observations at ground stations or ships at sea are made using instruments which have been substantially standardised for the past fifty years or more, barometers, thermometers and so forth, but many other instruments have been added to the armoury. First and foremost is the radio-sonde which must be given pride of place as the instrument which has revolutionized weather forecasting, both its practice and its theory, and greatly enhanced the utility of the service, to a critical extent for aviation. The radio-sonde, of which there are many variants, is an automatic radio transmitter attached to a buoyant balloon and released from the ground to ascend through the atmosphere above. The characteristics of the radio signal are determined by light-weight sensing elements, coupled to the electric circuitry of the sonde, aneroid barometers, bimetallic thermometers, hair hygrometers or other equivalent devices, so that the physical properties of the air are obtained by interpreting the signals. A typical sonde costing, say, £10 may be carried by a hydrogen-filled balloon costing £2 and may ascend at 1500 ft./min., reporting to the ground every few seconds until it is lost in distance or by bursting after rising for an hour or so, reaching perhaps to a height of 100,000 feet (20 miles). The ground equipment can be made as automatic as is desired and in one advanced example the signals are fed direct into an electronic computer and the data are printed out ready for the forecaster's attention. Winds are obtained from the same ascent by radar-tracking on the balloon. The application of ground radar to wind-finding came very early in the history of radar and was already well advanced during World War II. At the present time there are 8 upper air stations in the United Kingdom making ascents four times a day at an overall cost of perhaps £200,000 per year. In addition, we maintain ocean weather ships for obtaining similar data from the Atlantic, and a number of stations abroad. Over the whole world there are more than 500 upper air radio-sonde stations working on regular daily programmes.

Radar is applied to forecasting in another and quite different way by taking advantage of the reflecting power of rain-drops. Just as an airfield radar scanning the sky will plot and follow every aircraft within its range, so a weather radar of appropriate design will provide the forecaster with a continuously changing picture, effectively on a television screen, showing where in the neighbourhood rain is falling, how the rain areas are moving and, to some extent, their intensity and vertical height. A useful weather radar indicating over a range of 100 miles may cost £12,000 and there are, naturally, more sophisticated and more expensive equipments. To cover the whole world with a weather radar net would cost perhaps £100 million in capital outlay alone but the system has been well justified in special areas and is likely to become more widely used especially perhaps in backward or sparsely populated areas where ordinary observations and communications are not readily available.

Weather Satellites.

Many other instruments employing modern electronic systems could be listed, for example, cloud-height recorders which work by day or night, using a reflecting optical system with a light beam modulated and amplified, visibility meters based on the photoelectric measurement of the transmission or scattering of light, automatic unmanned weather stations for use at isolated places on land or at sea. But far and away the most exciting of recent developments are the weather satellites, known as *Tiros* and later *Nimbus*, launched by the United States. Several of these have been put into orbit and it is expected that henceforth one or more will be permanently in operation, revolving round the earth, taking television pictures of the earth below, especially of the clouds which cover about half the earth's surface, and transmitting the pictures to read-out stations suitably located. No country, other than America, had in 1962 yet announced its definite intention to go into this field and only Russia had the immediate capability. The cost will be high, no doubt running to hundreds of millions of dollars in a few years but the information obtained, especially from otherwise little-charted areas, has exceptional interest. Not only pictures of clouds over large areas, indeed the whole world, are obtainable, but in addition ways have been devised for estimating the energy exchange between Earth and space, and of obtaining the temperatures of cloud tops and sea surface from the infra-red radiation which they emit upwards. These and other quantities have much significance for the scientific study of our own planet which must not be overlooked in the exploration of space. In this connection the rocket also is a powerful atmospheric probe. It has the advantage that it can take measurements at all heights from the ground upwards and can be made to rise far beyond the 25 miles or so which is the practical limit of balloon sounding. Experimental rockets have been used widely and regular ascents will no doubt become a commonplace in future.

Progress in Forecasting Techniques and Scientific Theories.

In the practice of weather forecasting the last generation has seen a radical transformation from a scientific art practised by wise men of great experience labouring with scanty data and inadequate theories towards scientific calculation using standard theoretical methods based on proved theories and data from three dimensions provided especially by the radio-sonde. Weather is the behaviour of the atmosphere and the forecaster is certainly interested in the behaviour well into the stratosphere. By probing especially with balloon-borne sondes, the atmosphere is studied in three dimensions. It can then be treated by mathematical methods involving calculations which, in spite of the differences in the nature and size of the phenomena, have in principle much in common with those made in aerodynamics, hydrodynamics and fluid mechanics generally. First for the technique the weather systems which the new scientific methods are most suited to handle are the depressions and anticyclones hundreds or thousands of miles in extent which are continually forming, developing, moving and decaying and which must be forecast if we are to know the general nature of the weather, the temperatures or the winds. Surface weather maps have been drawn regularly for more than a hundred years and the modern advance is the drawing of other maps showing conditions in the upper air. At a centre such as Bracknell about ten series of charts are regularly drawn, covering the whole or a great part of the northern hemisphere and referring to the surface of the Earth or to various higher levels up to 50,000 feet where the pressure of the air is only one tenth of its value near the ground. As the flying level of commercial aircraft is raised to even greater heights in the stratosphere, routine charts for suitable higher levels will need to be constructed. These upper air charts contain systems of lines, isopleths, corresponding with the familiar isobars of the ordinary weather map, as well as plotted data on winds, temperatures and humidities. It can readily be appreciated that just as the architect may represent a building by drawing separate plans for each floor, so the forecaster may visualize the three-dimensional weather factory by putting together in his mind all the different analysed charts. One difference is that once a building is constructed the architect's drawings may be expected to remain valid for a long time whereas the weather changes continuously; the forecaster must have a moving picture in his mind and a forecast must be a consistent picture valid for all levels and satisfying the laws of fluid motion.

Forecasters become skilful in this kind of work but it is not the sort of thing that a man can do very reliably on the basis of experience and know-how. Lengthy numerical calculations are necessary and the invention of the electronic computing machine has provided the means whereby these calculations may be performed rapidly, systematically and quite consistently. The most advanced

computing machines yet designed have been employed on weather forecasting because it is an appallingly complicated problem when reduced to basic physics Such machines may cost some hundred of thousands of pounds and future designs even millions but the enhanced accuracy of weather forecasts which can confidently be expected and which indeed has already been to some degree achieved, will provide ample justification

The Scientific Problem of Prediction.

It is interesting to speculate on possible further progress in weather forecasting, to be prepared for notable improvements while avoiding the extravagant optimism which is founded only on ignorance, and the first thing to bear in mind is that looking into the future is an art of the most extreme difficulty whatever the subject may be For certain astronomical events, movements of the planets, eclipses and the like, high accuracy many years in advance is attained because the problems, formidable enough as they may seem, are essentially simple when compared with weather phenomena the inverse-square law of gravitation applied to a small number of heavenly bodies accounts for virtually everything The laws of physics which apply to the atmosphere are by contrast numerous, interrelated and complicated In its simplest formulation, atmospheric behaviour must conform with several independent laws expressed mathematically as differential equations The first is the hydrostatic law stating that vertical acceleration is negligible and that pressure at any level is the weight of the column of air above Next is the law of continuity of mass stating in effect that however the air moves it is not destroyed and a loss in one volume is balanced by a gain elsewhere Then the horizontal velocities of the air in two directions, that is the wind components, must conform with the mechanical law of fluid motion relating acceleration with the pressure gradient, the Earth's rotation and friction Again, the law of conservation of energy must be satisfied and account needs to be taken of many different kinds of energy and their transformation, especially internal thermal energy, gravitational potential energy, latent energy of water vapour and radiant energy, that is solar and terrestrial radiation, as well as mechanical work and kinetic energy And, finally, water substance must be conserved for, in the long run, evaporation and precipitation must balance Add to these six conditions the basic gas law and we have seven mathematical equations for seven quantities pressure, temperature, density, water vapour, and velocity in its three component directions The known laws are then sufficient to determine the problem, given the boundary conditions, but the complication is so formidable that success in foreseeing the future is likely to be severely limited Meteorologists today expect some solid improvement in forecasts for one or two days ahead but the degree of improvement will not seem striking to the general public More challenging than this is the forecasting of several days ahead and the foreshadowing in general terms of the weather to be expected months or seasons ahead—true long-range forecasting For this we await new ideas Certainly the weather varies a great deal from one year to the next, some winters in England will be mild and open, others bitterly cold, while the summers will vary from the heat and dryness of 1959 to the cold wetness of 1960 but we do not yet know what is the reason for these large variations and present attempts to forecast them are little more than speculations based on experience These may be more often right than wrong but no meteorologist of repute claims to be very skilful at long-range forecasting and progress will be very slow unless really new discoveries are made

OPTICAL MASERS

When the day comes to communicate with our neighbours on remote planets orbiting other stars our " radiotelephone " will probably make use of a beam of light from an optical maser This is a new and very remarkable kind of light source that was developed only in recent years. Its full potential is yet to be realised, but even now it has great importance With the optical maser we shall be able to probe the behaviour of matter under the influence of enormous energy densities, range and survey vast distances to microscopic accuracy, and send millions of telephone and television messages between any two points that can see each other with telescopes Little wonder that the optical maser has achieved wide prominence within but a few years. It is a development as central to optical science and engineering as the discovery of the triode valve was to electronics

From the time man first opened his eyes until late in 1960 when the first optical maser was developed most of our sources of light have been no different in principle from bodies heated to incandescence The sun, a hot tungsten filament, a candle, a gas fire, a carbon arc, even the glowing screen of a television set are some familiar examples All of these can be termed natural sources They are fine, of course, for the usual purposes of illumination, but not however for the additional purposes to which the optical maser can be put The reason for this restriction is a fundamental one Natural light is inherently subject to fluctuations in intensity technically called " noise " Maser light, as we shall see, is quite different, and more closely resembles radio signals

Light Waves and Radio Waves.

Radio waves that bring sound radio and television into our homes and light waves that bring visual perception into our lives are closely related forms of radiant energy from two regions of the electromagnetic spectrum The relationship is not obvious because radio wavelengths are many orders of magnitude too long to be detected visually The wavelengths of radiation we can see fall in the ranges of from 0 4 to 0 8 microns (one micron is one thousandth of a millimetre) while those of radio are from tens of thousands to millions of millions times longer In their familiar form radio signals come from sources, like valve oscillators, that are tractable to modulation, amplification and the many other operations known for many years in the field of electronics The result has been a versatile field rich in scientific discovery and practical application. It has always been desirable to extend electronics to shorter and shorter wavelengths so that a greater part of the electromagnetic spectrum could be exploited in similar ways, but the idea of generating non-noisy light has been particularly attractive, for reasons that we shall discuss

The techniques for generating and dealing with radio signals cannot be extended directly to light despite their close relationship Even if it were possible in theory to scale electronic equipment for shorter and shorter wavelengths by the time it would be scaled to the wavelengths of light the equipment would have to be of microscopically small dimensions The optical maser is a development that avoids these difficulties but produces the desired result

Incoherent Light.

Light from a natural source is emitted at random by agitated electrons It is the usual case that electrons independently and spontaneously emit bits of light to add to the general glow to be seen from the source As a result natural light is mainly what we call incoherent Expressed as a kind of wave motion natural light has to be regarded as brief packets of energy travelling in random directions at uncorrelated times Incoherent light therefore is neither well-directed in space nor smooth in time The former results in the fact that illumination from our familiar light sources is proportional to the inverse square of the distance from the source which implies that only a fraction of the light energy can ever be collected and focused to a small spot or collimated and sent along a parallel beam The latter means that ordinary light is inherently much too unsteady to be an efficient carrier of information coded in time.

Coherent Light.

Light from an optical maser also comes from agitated electrons, but another process dominates the kind of radiation. In effect, many electrons radiate together under the common stimulus of an incident light wave This co-operative phenomenon, which is called stimulated emission, leads to light which is both well-directed in space and smooth in time Maser light, in contrast to natural light, is coherent and can be expressed as a regular progression of waves carrying energy along a particular path. The essential difference, therefore, is that maser light is an orderly sort of wave motion like that of breakers falling rhythmically against the seashore, while ordinary light is a disordered and random sort not very different from the rippled surface of the sea broken by rainfall All of the potential and actual uses for the optical maser stem from this difference

Maser Action.

When a light beam encounters any transparent medium whether it be solid, liquid, or gas the normal behaviour is for some fraction of the energy in the beam to be progressively absorbed In other words the further a light beam travels through a medium the more attenuated it usually becomes But in an optical maser the reverse happens and an incident beam becomes progressively brightened The medium is made to give up energy and amplify an incident beam

We are familiar with the howls and whistles (which in fact are audio oscillations) that can be produced in a public address system when too much sound from the loudspeaker reaches the microphone In a similar way, our amplifying medium can be made to produce steady oscillations of light What is needed is a pair of mirrors, one at each end of the medium, to reflect an amplified beam of light back upon itself The beam is confined and has no alternative but to build up intensity with each traversal between the mirrors The amplifier would continue this process indefinitely except that it saturates at some limiting intensity When this happens the system produces steady oscillations around the original signal many times fed back upon itself If both of the mirrors were perfectly reflecting none of the energy so generated would be able to leave the system We therefore make one of the mirrors slightly transparent, and now a fraction emerges

Dozens of different materials have worked as optical masers Common to all of them is the underlying process called stimulated emission of radiation The same principle was originally applied to microwave devices, and the name, maser, derives from the expression "*m*icrowave *a*mplification by the *s*timulated *e*mission of *r*adiation". Upon application to light wavelengths the microwave part of the name lost its meaning and the term became generally descriptive of any device in which stimulated emission dominates Now, for lack of any standard nomenclature, the optical maser is frequently referred to by the name laser, the *l* standing for *l*ight One detailed example, the optical maser made from synthetic ruby, is sufficiently representative to illustrate the basic idea

Ruby Masers in Theory.

Synthetic ruby, like its naturally occurring counterpart, is a crystal of aluminium oxide with a small percentage of chromium atoms replacing some of the aluminium during the growth of the crystal A strongly fluorescent material, it absorbs broad bands of blue and green light and re-radiates much of the energy in the form of a narrow band of red light. The red fluorescence gives ruby its colour, and arises from the way electrons belonging to the chromium atoms interact with radiation

These electrons can exist only in particular energy states. Their state of lowest energy, the so-called ground state, is the normal relaxed one. The action of blue and green light when it is absorbed by the crystal is to elevate some ground state electrons indirectly to a sharply defined excited state From here they can either give up spontaneously some of their excess energy in the form of red fluorescence light and relax back to the ground state, or they can wait for an incident light beam of the same wavelength and add their energy to it synchronously on their way back to the ground state In either case the wavelength of the emitted light is determined by the difference in energy between the ground and excited states

The first process is called spontaneous emission of radiation and produces ordinary thermal light The second process is called stimulated emission of radiation and, when it dominates, it produces the conditions we described earlier which lead to amplification of light However, electrons in the ground state are just as susceptible to the influence of an incident red beam as the excited electrons, and whereas the excited ones undergo stimulated emission and give up energy to the incident beam, the ground state ones undergo (stimulated) absorption and take some away in proportion to their numbers For net amplification, therefore, a majority of the electrons must be in the excited state To put them there enough energy must be supplied to the crystal in the form of blue and green light Then so long as a population majority is maintained in the excited state the crystal will prefer to amplify any incident light of the correct wavelength In the absence of stimulated emission the system will regain equilibrium by the spontaneous process

Ruby Masers in Practice.

One practical way of putting enough blue and green light into a ruby crystal to bring it to the maser condition is to bathe it with light from a very bright xenon flashtube like the kind used for ordinary flash photography The flash will last for only about one thousandth of a second, but for a sizable fraction of this time the crystal will be capable of amplifying light If the crystal has the form of a right circular cylinder, with its end faces polished flat and parallel to each other, and if these faces have highly reflecting coatings one of them slightly transparent, then conditions are right for generating coherent light For the time that the crystal is sufficiently activated by the flash tube it will oscillate in the way we have previously described Some fluorescence or stray light travelling along the axis of the crystal will trigger off the process Then since only a parallel beam of light will reflect back and forth between the two faces only light travelling in that direction will build up to a great intensity, and a fraction of it will come out through the semi-transparent face It will be confined to a very narrow cone, steady in brightness for as long as the oscillations can be supported by a supply of energy from the flashlamp, and it will be very nearly a single red wavelength (stabilized at the wavelength where the gain of the medium is greatest)

The output from a pulsed ruby optical maser is a tidal wave of light with kilowatts or even megawatts of peak power and, except for diffraction effects from where it emerges, nearly all of the energy appears along a well-defined wavefront By means of lenses and telescopes this energy can be harnessed almost in its entirety It can be beamed vast distances through a telescope, or focused to tiny spots of incredibly intense light

Recent experiments have demonstrated what maser light from a ruby can actually do in this way A ruby optical maser in one such experiment was connected to a large telescope and aimed at the moon At a distance of a quarter of a million miles it illuminated an area of the moon no more than a few miles across. This was verified by means of another telescope trained on the same part of the moon when, not quite three seconds after each burst of maser light was sent out, a little of the reflected light was detected after its round trip Detection back on earth was difficult because the moon is a diffuse reflector and little of the light was returned to its source. But an observer many times further away than the moon would have had no trouble seeing the direct beam The reach of our strongest searchlight is paltry in comparison In another experiment

the output of a ruby optical maser was focused and brought to bear on an industrial diamond. So generated, this needle point of concentrated light had sufficient energy to vapourize a substantial portion of the diamond. Sunlight can be focused with a magnifying glass and used to ignite paper and wood. To collect and use more of the sun's energy requires much larger optical systems, and in no case can temperatures in the focused sunlight exceed 6000° K, the surface temperature of the sun. But with comparatively simple optics the ruby optical maser can just as easily drill holes into the toughest of refractory materials, and achieve very much higher temperatures with its focused light.

Maser Materials.

Now that the techniques have been discovered for building optical masers there is no theoretical limit to the number of substances that can be used for this purpose. Many have already been found, even at this early stage of development, and a list of them includes quite a variety of crystalline and plastic solids, fluorescent liquids, semi-conductor compounds, and mixtures of gases. They operate at various wavelengths falling throughout the optical spectrum from the ultra-violet to the infrared. Some, like our example of ruby, operate on a pulsed basis with outputs of high power while others, like a gaseous mixture of helium and neon operate continuously but at low output powers.

Continuously Operating Masers.

Continuous operation is an important development for certain applications. The first to have worked continuously is the helium-neon optical maser. In this device light amplification is obtained from neon atoms whose electrons are put steadily into an active state. An electrical discharge is used to do this indirectly by means of helium atoms that act as intermediaries in the energy transaction. The device in essence is a tube containing the gaseous mixture that becomes the amplifying medium, an electrical source to excite the discharge in the tube, and two mirrors (one slightly transparent) to confine the oscillations and permit a little of the light to emerge, so long as the discharge is maintained, a steady output of coherent light is developed.

A continuously operating optical maser has extended regularity in time. This has applications in the science of measurement. Distances can be measured in terms of wavelengths of light to a maximum of the distance that the reference light beam can travel during its brief period of regularity. This is the so-called coherence length. The best natural source in this respect is regular for no more than a few thousandths of one millionth of one second, the time it takes for light to travel about one yard. Light from a helium-neon maser has detailed regularity for much longer - one second or more - and light can travel 186,000 miles in this period. So with optical masers at our disposal we can now speculate about measuring the farthest points on earth and even interplanetary distances to within a small fraction of an inch.

Possible Technical Uses.

The optical maser is like a radio frequency oscillator but many decades down in wavelength. The implications of this similarity are important. The pulsed optical maser will produce light oscillations chopped into a kind of Morse code. A continuously operating one will produce steady oscillations that, when modulated, will be able to carry messages in the same way that radio beams do. But beams of electromagnetic energy spread out and become diffuse at great distances from their sources, the effect being proportional to wavelength, so in this respect beams of maser light will be orders of magnitude more concentrated than radio beams of the same power. The bandwidth that can be carried by these beams is inversely proportional to the wavelength, so not only can the equivalent maser beam go much further, it can carry vastly more messages than a radio beam. The reach, definition and synchronism of coherent light have obvious appeals for the idea of an optical radar system. With beams of maser light objects will be detected at greater distances, located to increased accuracy, and their velocities clocked to higher precision than with traditional radar systems using radio beams.

The Maser in Research.

For the science-minded the optical maser holds most interest in the realms of basic research. For some of us, the intriguing questions raised by this development involve the basic nature of maser light: how it can be understood and described in detail, what it means to combine two maser beams from independent sources (like two interfering radio stations) and observe beat notes between them, what it means to produce fringes between two independent maser beams whose light waves are so well organised that they can interfere broadly with each other, why ordinary light is too disorganised in time and space for either of these effects to occur. For others of us the influence of maser light upon external things attracts our attention. New physical effects predicted theoretically about the action of this light source can be investigated. One example is an exceptional "non-linear" behaviour of quartz and other crystals that can be shown up by the intense, monochromatic light from a ruby optical maser, the incident red light will be doubled in frequency (and halved in wavelength) and both red and its harmonically related blue light will emerge from a crystal so illuminated. Other effects are just as likely to be noticed first and explained afterwards. Chemists among us are wondering how maser light can affect chemical reactions, biologists how it can affect living tissues. Metallurgists and others are planning novel ways of using it to work difficult materials, and communication engineers are speculating about limitless numbers of messages between boundless populations. Technologists of all kinds are finding their horizons broadened, and every one of us is starting to feel the consequences of increased knowledge and advanced technology which the optical maser is bringing.

THE GENETIC CODE

Imagine an organisation responsible for manufacturing a range of vital products. There is a headquarters which issues the controlling instructions, a group of factories where the work is done, a supply department for bringing in raw materials and power, and a communication system whereby information passes to and from the headquarters. This is a simile for certain aspects or functions of the living cell. The vital products we have in mind are protein molecules, the headquarters is the nucleus, the protein factories are small structures outside the nucleus called ribosomes. If we now ask how does this organisation work? we raise a set of biochemical questions of extraordinary complexity. This article is concerned with a small group of these, namely, how are the products specified at headquarters and how are the factories instructed what to make? In recent years great progress has been made in finding answers to these questions, though there is still much to learn. To approach the problem we first consider the desired products.

Proteins.

The importance of proteins to living matter is stressed on **F20** and **21**. Within a cell, the processes of growth and reproduction are chemical reactions which are tightly controlled by an important class of proteins called enzymes. Enzymes are catalysts, or accelerators, for the chemical reactions and each enzyme has a precise duty to perform. Therefore it is essential for growth and reproduction that just the right enzymes are produced when required.

A protein molecule is not simple. It consists of a long chain of at least a hundred chemical groups called amino-acids. Some, or all, of twenty different kinds of amino-acid occur in natural proteins and the different proteins are characterised by the arrangement of the various

amino-acids along the chain. This arrangement is known in detail for a small number of proteins. The geometrical form of the chain may be highly complicated.

The Genetic Information.

It has long been accepted that genetic information is transmitted by the chromosomes in the nucleus, *i.e.*, the chromosomes are the structures in the headquarters which are the repository of all the specifications required to determine which proteins have to be produced. When cells multiply, these instructions have to be passed on to the new cells to ensure that they replicate the parent. In an industrial organisation, the production schedule might conceivably consist of a long strip of paper on which is typed a list of instructions such as "Make Product No 22/ Make product No 7/ Make Product No 958/ ..." In the cell the chromosomes constitute the long strip and each instruction is an order to make a certain enzyme.

DNA.

Chromosomes are long molecules of the chemical deoxyribo-nucleic acid, DNA for short. Imagine an ordinary ladder made of two sides and numerous rungs. Now suppose it is twisted into a helix somewhat similar to a spiral staircase. Watson and Crick showed that the DNA molecule has this form with sides and rungs of the following nature. The sides are long chains of alternate molecules of phosphoric acid and a sugar called deoxyribose. From the side of the sugar there juts out a group of atoms called a " base ". The base makes up part of a rung the other part of which is a base jutting from a sugar on the other side. The two parts of a rung are joined by a hydrogen atom. The join is not very strong and the molecule can split down the middle of the rungs into two separate strands. Chromosomes do divide in this way at mitosis (F20).

There are four kinds of bases called adenine (A), cytosine (C), guanine (G), and thymine (T), and rungs are formed either by A-T links or by C-G links. The unit consisting of the phosphoric acid molecule plus the sugar plus the associated base is called a nucleotide. One strand of the DNA molecule is therefore a chain of many nucleotides, perhaps many million, the number depending on the complexity of the cell involved.

The Code.

An instruction such as " Make such and such a protein " is now believed to be registered on a suitable length of DNA, perhaps some hundreds of nucleotides long. The whole chromosome is long enough to contain vast numbers of such specifications one after the other. The precise specification for any one protein is laid down by an appropriate arrangement of bases and since the proteins are chains of amino-acids, there must be some special sequence of bases to denote each amino-acid. A basic code problem is therefore what arrangement of bases signifies a particular amino-acid? If the bases, A,C,G,T are regarded as letters of a code, what would be the code word for, say, phenylaniline (one of the amino-acids)?

We note first that it would not be possible for each base to be the sign for one amino-acid (*i.e.*, code words 1 letter long) because there are twenty amino-acids but only four bases. Nor will two letter code words do because, out of four bases, one can make only sixteen different pairs. Therefore the code word for each acid must have at least three bases in it for there are 64 possible triplets in four bases. A code of triplets is therefore the smallest one to cover the 20 amino-acids required in proteins and there is much evidence that the genetic code is in fact based on triplets, though the possibility of combinations of triplets (sextuplets, etc.) is not definitely ruled out. Since only 20 triplets are needed and there are 64 available, there are 44 " superfluous " ones. Some of these may represent special messages such as " Begin here " or " End here ", but it is also possible that two or more triplets may represent the same amino-acid.

Do the Triplets Overlap?

To illustrate the complexity of the matter we note that, even if it were granted that the code letters are strung out along the DNA chain, there would be more than one way to read them off. For example, suppose a short section of the chain had bases in the order AGCCGT. This could represent two separate triplets, AGC and CGT, the second beginning where the first left off. But if triplets overlap one another the same six letters would be read off as four words: AGC, GCC, CCG, CGT.

The second possibility would mean that the order in which amino-acids could be incorporated into proteins would be partially restricted, if one is prescribed by AGC, the next must start with GC . . . Experimentally, if one takes proteins as a class, there seems to be no restriction on the order in which amino-acids follow one another on the chain. For this and other reasons an overlapping code has been rejected in favour of a consecutive series of triplets.

The Use of Bacteriophages.

Much of the foregoing information about the genetic code we owe to the work of Crick and his collaborators at Cambridge. They perform many ingenious and complex experiments with an organism known as the T4 bacteriophage. This is a virus which infects and grows in a bacterium called colon bacillus. The virus consists essentially of a DNA molecule, some 200,000 base pairs (" rungs ") long, inside a protein case. To attack the bacterial cell, the DNA enters and re-organises the chemical functioning. Instead of the proteins it would normally make, the cell is forced to generate enzymes designed to reproduce the virus. T4 rapidly multiplies and eventually bursts the cell and invades other bacteria. In the course of half an hour many generations of exact replicas of the original phage will have been produced. The DNA of the phage has imposed its coded instructions on the bacterial cells' protein production.

The rapidity of multiplication has enabled workers in a number of laboratories quickly to perform experiments which in more complex organisms would take months or years of breeding.

Mutation.

The exact duplication of the T4 phage requires that all 200,000 pairs of bases be copied without error. An error is a change in the genetic message, or a mutation, and it results in a mutant form of the virus being developed. Mutations occur naturally sometimes, but they can be deliberately induced by treating the natural or wild type of phage with certain chemicals. The mutant phages can be recognised by the characteristic shape of the colonies they develop in bacterial cultures.

Chemicals called acridines are believed to produce mutations which consist in the *deletion* or *addition* of a base or bases from the DNA chain. Suppose two different mutant forms have been so produced. Let them both be allowed to reproduce at the same time in a culture of bacteria and let there be many more phages than bacteria so that there is a good chance that a cell is invaded by both mutant forms at once. It then turns out that some of the next generation of phages will not resemble either of the parent types but will have *both* mutations or, possibly, *neither*. These new forms are called recombinants.

We can now consider an example of the Cambridge experiments on the genetic code.

Investigations of the Code.

For the sake of argument, suppose that some of the bases along a strand of the normal DNA molecule are . . CATCGTGCT . . . The dots refer to numerous other bases before and after the section concerned. Let us assume for the time being that this section specifies three amino-acids by the triplets CAT, CGT, GCT. Suppose now that a mutation deletes the middle

G, the triplet sequence now reads CAT, CTG, CT and all words right of the mutation are completely changed This would destroy the meaning of the message and prevent the proper reproduction of the phage Similarly, if the mutation consisted of the insertion of an extra base, say A, after the middle G, the message would read CAT, CGA, TGC, T and the triplets are likewise disorganised to the right of the mutation

Suppose now that a recombinant is formed which contains both these mutations at once (*i e*, G out, A in) The message is now CAT, CAT, GCT This message is practically correct because the two mutations have cancelled one another except for the small segment right in the middle As the change is small, this message will function properly in the reproductive process

But now envisage a situation in which the addition and deletion occurred at widely separated sites instead of almost at the same place This would mean that in the recombinant a long section of the message would be spoiled, *i e*, that part between the two mutations This would preclude proper protein production and the recombinant could not now reproduce the original variety of phage

In this paragraph, we have been using the theory to predict possible observable results Of course, the discoverers worked the other way They examined the results of many mutation and recombination experiments and devised a theory to account for them This type of experiment provides strong evidence for the view that the genetic message is strung out along the DNA molecule and is read off successively from some starting point—for if the sequence is disrupted by a deletion the message is distorted but if the deletion is cancelled by a *nearby* addition the message is restored

Why assume a Triplet Code?

Similar experiments strongly suggest that it is indeed triplets of bases that specify amino-acids Suppose we have two different mutants each with an extra base inserted in the same neighbourhood Their genetic messages have been effectively distorted for the reason given in the preceding paragraph If they form a recombinant containing both additions, the message is still completely distorted to the right of the mutations But if there are *three* additions close together the message is almost completely restored again *if the code words are really triplets* This can be seen by comparing the original sequence in the preceding paragraph with the following one in which italic type denotes the three additions

. . CAT(C*GT*G*A*T)GCT . . . .

Only the part in brackets has been distorted, all the rest will divide into the original groups of three again The proper functioning of the reproductive process with three, but not one or two additions was what the experimenters found The same applies with deletions instead of additions If the code for an amino-acid were four bases long, three additions would not have worked, four would have been necessary

Genes.

We shall not attempt to describe any more of these experiments Needless to say, there is very much more involved than this brief and idealised account can possibly indicate. There is for example the question of what is to be conveyed by the word "gene". In classical genetics a gene is a portion of a chromosome responsible for some detectable physical characteristic such as colour of the eyes or hair The T4 virus is observable only with the electron microscope and genetic changes are recognisable by the way colonies of viruses grow in bacterial cultures. By observing and analysing such phenomena, Benzer in the United States has shown that a particular section of the DNA molecule is responsible for a certain definite characteristic in T4 One might call this section a gene But Benzer also showed that two adjacent subsections of this length, each some hundreds of bases long, can function independently of one another and some refer to these subsections as genes Whatever the terminology, it is clear that there are interesting problems involved in finding out how many bases, and which ones, are in each independently acting section of DNA and what decides where one section ends and another begins

RNA.

So far we have only discussed how the specifications for proteins are written into the chromosomes by the sequence of triplets along the DNA The DNA by itself does not generate the proteins, but it forms another similar molecule, called RNA, which contains an exactly similar sequence of triplets

RNA is short for ribonucleic acid which differs from DNA in two ways (i) the sugar, deoxyribose, is replaced by another called ribose and (ii) the base, thymine, is replaced by another called uracil (U) When a cell reproduces, the double stranded DNA divides into its single strands and each one acts as a template or mould for building an exactly corresponding molecule of RNA This is called "messenger RNA" for the reason that it moves out of the cell nucleus and travels to the ribosomes where the proteins are made, carrying with it the instructions originally present in the DNA

Complicated reactions go forward in the ribosomes and at least one other type of RNA is involved which has the specific function of transporting amino-acids into the ribosomes so that they can be joined together in the order laid down by the sequence of triplets in the messenger RNA Much work is in hand to elucidate the exact organisation of the chemical reactions that finally produce the proteins

The Biochemical Approach.

The unravelling of the code as outlined above has mainly been achieved by genetic experiments with viruses Simultaneously, however, the problems have been studied biochemically and much further evidence has been collected in favour of the triplet code theory

It was stated before that DNA and RNA could be referred to as long chains of nucleotides In recent years it has been possible to synthesise small chains of nucleotides Suppose such a chain containing only one kind of base, say uracil, were made, a convenient name for it would be poly-U Nirenberg and his co-workers (U S National Institute of Health) made a great advance when they showed that poly-U would work in some ways just like messenger RNA in a suitable enzyme preparation derived from colon bacillus That is, poly-U brought about the production of an amino-acid chain—which is a reaction comparable to RNA causing protein production Poly-U, however, gave rise to a chain with only one kind of amino-acid on it, namely, phenylanine This is very strong evidence for the view that the RNA code word for phenylanine contains uracil bases only Assuming the triplet theory therefore, one would conclude that the RNA code for phenylanine is UUU Since then, Nirenberg, and also Ochoa and his colleagues (New York University School of Medicine) have used synthetic nucleotide chains to find out the code triplets for fourteen different amino-acids One more example is UAC (uracil, adenine, cytosine) is the coded instruction for histidine, though it might be CAU or some other rearrangement of C, A, and U, for chemical experiments cannot determine the *sequence* of bases, only their nature

Such rapid progress has been made in the last few years that it does not seem unreasonable to expect that the meaning of every triplet combination of four bases present in DNA and RNA will be understood in the not too distant future Dealing as it does with some of the innermost secrets of living matter, this work must be regarded as one of the most exciting frontiers of modern science.

BIOLOGICAL CLOCKS

In the inanimate world rhythmical phenomena are most commonly produced by such mechanical systems as pendulums or clocks Consequently, it has long been customary to explain biological rhythms by the working of similar devices which are called biological clocks Accepting this analogy for the moment, we can provisionally describe the oscillations of biological systems in the terminology appropriate to mechanical clocks, and we may compare their working with that of clocks or with the relative movements of the earth, the sun, and the moon

Private and Cosmic Time.

A brief survey done in this manner reveals that a fundamental distinction can be made between biological rhythms governed by "private time" or "physiological time," like heart beats and breathing, and those governed by "cosmic time" or "astronomical time," like seasonal breeding cycles or diurnal migrations The distinction may be illustrated by the following examples While the heart rate may differ slightly between day and night, it does not itself beat "cosmic" time but depends on such "private" factors as the species and size of the animal, its age, momentary state, and other physiological circumstances such as temperature Private biological rhythms can persist under constant conditions with great regularity and for a long time Thus the isolated heart of a frog may beat monotonously for many hours if it is supplied with the right salt solution (such as Ringer solution) at the right temperature Similarly the wings of a hovering insect may beat for many minutes with constant strength and frequency On the other hand, diurnal, lunar, and seasonal cycles are distinctive precisely by their relative independence of factors which control the scale of physiological time and by their dependence on cosmic time The significance of this is commonly understood to be adaptive, that is to say, to be a guarantee that certain biological events take place at favourable phases of the day, month, or year independently of the prevailing temperature and other physiological conditions

Rhythms showing an Environment-dependent Frequency.

The simplest type of biological rhythm, with a cosmic frequency, consists of a set of responses by an organism to some cyclical element in its environment; it does not persist in "constant conditions" Examples are the diurnal, vertical migrations of some planktonic crustaceans in the sea and in lakes The vertical movements of these animals are regulated by the daily changes in the intensity of light, and we believe that they ensure that the individuals are thus kept near an optimum position for feeding and breeding As a rule the crustaceans rise during the dawn and descend (disperse) later in the day In constant darkness or constant illumination the up and down movements of most of the species cease, but they continue under laboratory conditions when daylight and darkness are allowed to operate When artificial illumination of variable intensity is applied, the movements appear to be independent of the period of the changes and are, in fact, controlled only by the intensity of the overhead light

The responses of many animals and plants to the seasons and the reactions of many shore animals to the tides are presumably also of this type

Rhythms showing an Environment-induced Frequency.

A second group of rhythms can be induced experimentally by the suitable manipulation of an environmental rhythm of arbitrary period These rhythms persist for a few cycles after removal of external reinforcement and are called entrained In so far as they usually follow environmental periods (days, months, years) they are working on the plausible "assumption" that one day follows another, and so on

The existence of this type of rhythm has often been doubted and it is a fact that a celebrated result, the training of ants to arbitrary feeding intervals, could not be produced on repetition On the other hand, it seems that various respiratory cycles of a green alga, *Hydrodictyon*, have been induced by suitable light darkness alternation and that these cycles persisted for some time in complete darkness It has also been reported that similarly persistent cyclical outbursts of motor activity have been forced on cockroaches Time intervals of a few seconds or minutes can certainly be impressed on human beings who can, more or less accurately, estimate a given time interval Most people, in their schooldays, have experienced the feeling that a lesson ought to finish only to hear the bell ringing immediately afterwards

Rhythms showing an Environment-independent Frequency; Circadian Rhythms.

In these rhythms the highest degree of independence from external disturbances, such as temperature changes, is achieved They have remarkably stable genetically-determined frequencies, closely, but not exactly, corresponding to external (cosmic) periods such as days, months, or years. The fact that these rhythms, when deprived of rhythmical external cues, never show an exact correspondence with the cosmic rhythms has been emphasised by creating a special name for those approaching a 24-hour period They are called "circadian" from "circa diem" ("about a day") The phase and amplitude of most rhythms of this type can be manipulated, but their frequency cannot be permanently altered by changes in the environment They persist in constant conditions more or less accurately in the laboratory Like a clock a rhythm of this type can be started by a single application of the controlling stimulus

An example is the well known emergence, or eclosion, rhythm of *Drosophila*, the fruit fly Flies reared in a culture bottle in the dark may emerge at any hour of the day, but a single flash of light, lasting only a minute, can synchronise the emergence of the majority of flies for several days so that the emergence peaks will be spaced at about 24-hour intervals

The time patterns of motor activity of most vertebrates and insects and the pigment changes in crustaceans can be controlled in similar ways

Limitations of the Analogy.

Living systems are more complex than clocks, pendulums, or other machinery, this becomes manifest from the general observation that most -but not all -biological time-space relations are less accurately predictable and regular than mechanical oscillations Therefore some caution is needed when applying the terminology and theory of clocks to living systems The definition of a biological rhythm must, for example, be less exact than that of a periodicity in the inanimate world, but it must be more flexible A possible but vague definition of a biological rhythm would be the *fairly regular recurrence of the similar*

Methods of Exploration.

Acceptance of this definition has far-reaching consequences for the mathematical treatment of biological periodicities, the elaborate method of harmonic analysis, a mathematical procedure which has been such a powerful tool in the hands of astronomers, physicists, and engineers, is successful only in the demonstration of diurnal, lunar, seasonal, or similar regular components in biological or economical measurements *Private* biological rhythms cannot readily be described in terms of oscillations of constant period length, and to subject them to harmonic analysis will often mislead Different more flexible statistical procedures must therefore be tried—procedures which are better adapted to the peculiarities of living systems.

Among recurrent events, we find many degrees of regularity. At one end of the scale are the

fluctuations which are characterised by irregular, and more or less unpredictable, sequences of numbers or of measurements. An example of quite independent events is provided by the emission of particles by radioactive substances. Slightly more regular and therefore predictable is the number of bees per minute which leave a hive during an hour, or the daily milk yield of a dairy cow from month to month as the seasons change. At the other end of the scale we find regular and predictable oscillations, which are commonly called rhythms or cycles, such as the heart-beat of a sleeping child or the diurnal alternation between sleep and wakefulness of passerine birds. It is clear that the clock analogy can be only applied to the latter cases.

The Diversity of Biological Clocks.

The discovery that very diverse rhythmical biological phenomena can be described by identical mathematical formulæ has been variously interpreted. Some specialists have asserted that any claim of uniformity among biorhythms is spurious and of no practical use. There is however little doubt that all biological rhythms are the result of interacting internal metabolic processes, the intensities of which are controlled by one another or by external rhythmic forces and that, therefore, more than merely formal similarities must exist between any two biorhythms. Moreover apparently the most disparate rhythmical processes can be shown to interact, as an example let us consider egg laying. Ducks lay their eggs in the morning hours, under the influence of daily changes of illumination, the egg weight fluctuates rhythmically according to the physiological state of a bird and sometimes one or two days are missed. Further, the weight of successive eggs in a clutch falls from a maximum to a minimum and the number of eggs per week decreases in autumn as a consequence of the seasonally shortening days. In hens similar relations exist, except that the eggs in a clutch of a bad layer may be laid at a later hour every day.

Demultiplication.

The characteristic phenomenon of demultiplication (leaving out one or several periods, the lapse of a day or two in egg-laying) is observed in many biological systems. Cicadas, cockchafers, mayflies, and many other insect species emerge at a well-defined phase of the seasonal cycle, and at particular hours of the day or night, but their larvæ take several years to reach adult stage. In the laboratory, *Drosophila* and other insects also emerge from their pupæ at specific hours, although the number of days they need for development may vary, *e.g.* with the temperature. "Loss of several periods" is also very conspicuous in female laboratory rats, these show an œstrous cycle of four or five days' duration on which one finds superimposed the 24-hour rhythm and probably a seasonal cycle. Thus maximum mating propensity and a favourable state of the genetical tract, demonstrable by the use of vaginal smears, occurs every fourth or fifth night when the nightly maximum of general motor activity of these rats measured in a running cage is also highest. Demultiplication can also be produced experimentally, by moderate cooling (at about 12° C) cockroaches in constant illumination tend to miss every second night's activity.

Time Cues.

The time cues which enforce or synchronise actual biorhythms to cosmic periods, are generated by the relative movements of the earth, the sun, and the moon.

I. *The rotation of the earth round its axis* causes
(*a*) the change of day and night, with a mean duration of about 24 hours,
(*b*) the solar tidal component with a period of about 12 hours.

II. *The revolution of the earth round the sun* causes the changes of the seasons.

III. *The revolution of the moon round the earth*
(*a*) the changes of the phases of the moon;
(*b*) the lunar tidal component of about 12.5 hours.

In addition to these primary periodicities, there are also secondary periods derived from the above which are important, *e.g.*

1. The combination of day and season which results in the seasonal changes of the length of the day.
2. The combination of the solar and lunar tidal components which results in the (roughly fortnightly) change of tidal amplitude.
3. The six-monthly period between neap tides which results from the divergence between the planes of the orbit of the earth and the moon.

Physical Cues.

Illumination. Periodic changes in light *intensity*, whether gradual or sudden, control a great number of diurnal biorhythms, such as leaf and petal movements, locomotion, eclosion, and egg-laying. Light cues operate in most terrestrial and aquatic habitats. Often quite low intensities are found to be effective. The *quality* (wavelength composition) of the light is also important for the control of many biorhythms.

The daily up and down movements of the primary leaves of bean plants (*Phaseolus multiflorus*) are only affected by light-red and dark-red light, the former retarding and the latter speeding up the movements. In the light-red light, the leaves continue to go up and down regularly for a week or longer, but in the dark red irregularities set in after a few days.

A single transition from permanent darkness or from permanent illumination of any colour to permanent light red sets the Phaseolus leaves into oscillation, but no other transition does. The simultaneous application of dark red and light red abolishes the effect and no leaf movements ensue. Dark red applied for twelve hours, after twelve hours of light-red treatment, also prevents the inception of a rhythm.

It is therefore reasonable to assume that a system of at least two antagonistic pigments is at work in creating these daily leaf movements.

The effects of various parts of the spectrum on the release of animal rhythms have been recorded and the importance of short wavelength has frequently been stressed but no general rule has so far emerged which is comparable with the one in plants.

Localisation.

The rhythm receptors are probably dispersed throughout the tissues of flowering plants. In higher animals the rhythm receptors may be the eyes or neural regions closely associated with the eyes, but possibly other sites (*e.g.* the skin) can also be sensitive.

Temperature.

Changes in temperature are often found to act as time cues. The emergence rhythms of insects which, on the whole, are dominated by light cues, also respond to the daily temperature changes, indeed, illumination and temperature cues can come into conflict. It is assumed that blind mammals and people take the daily temperature fluctuations as one of their time cues. Blinded rats are most active in running wheels when their cages are cold. The diurnal changes of the chromatophores (pigmented parts of cells) of salamanders can be regulated by temperature cues. Cooling below a certain level inhibits the nightly activity of ants and other insects. Chilling has been experimentally used to interrupt the working of such clocks.

Changes in air *humidity, air pressure, wind velocity, and air electricity* have often been suspected of acting as time cues by such diverse

people as pathologists, entomologists, anglers, and others, and some evidence exists to support these claims.

Chemical Cues.—Some flowers emit their fragrance at certain times of day (labiates) or night (night violets) or at dusk (phlox) and thus may set rhythms for their pollinators.

Periodic Food Supply is a very potent cue in respect of the twenty-four hour period, as is well known to any schoolboy or animal lover. The time of meals has marked effects on individual and social habits. The daily changing nectar and pollen supply of flowers dominates the foraging activities of honey bees.

Biological and Social Cues.—Sounds and noises are, of course, physical cues but they are sometimes of biological origin. Acoustic time cues may be either rhythmic changes of background noise level or specific signals. The daily sequence of domestic and street noises is very powerful in gearing sleep and activity of civilised man to that of his own community. This is of the greatest importance to the night worker, who can only partially escape these acoustic cues.

Parasites and symbionts are dependent on the *periodicity* of their *hosts* or *vectors*.

For individuals in animal aggregates or animal societies, a great variety of *social interactions* provide very powerful time cues.

Phase Setting.

Innate or acquired phase setting.—The phase relation, or time lag, between an external cue and an observed response may be fixed or it may be adjustable. A particular fungus will shoot out its spores about two hours after darkness has fallen, be it as a consequence of natural nightfall or of experimental shading, and it cannot be induced to do this five hours after darkening. On the other hand honey bees can be trained to visit a source of food at any hour of the day or—in experimental conditions—of the night.

The Nature of Biological Clockwork.

It is necessary to check deductions from the clock analogy by direct observations of the actual structures which exhibit periodicity in the living world, and also to make use of analogies with other machinery capable of producing oscillations, for example electronic devices. As yet no single comprehensive model of biorhythms has emerged, either in reality or in thought.

Many investigators of biological rhythms have asserted that special structures, such as the nervous system or the endocrine system, are the sole carriers of biological rhythmicity, and an even greater number of workers have tacitly assumed it. However, biological rhythms occur in organisms, such as plants and unicellular animals, which do not have either of these organ systems. Even more surprising, some observations on individual cells indicate that no permanency of cell structure is required for the *continuation of rhythm*. Perhaps the most striking example of this is the diurnal change in light reaction of the unicellular green alga, *Euglena gracilis*. These flagellates, which have a red eye spot, are strongly attracted to light during the day, but are rather indifferent to it during the night. This regular change of phototactic "mood" has been shown by special devices to continue in the absence of any external twenty-four periodicity and the rhythm continues in spite of the fact that the flagellates have meanwhile repeatedly multiplied. This ability of the "clocks" of continuing to run while reproducing themselves is not paralleled by any man-made clock on the market.

The maintenance of a self-sustained rhythm must, in some way, be connected with compensatory metabolic arrangements. There must be at least one device present in the organism which is composed of two antagonistic parts.

Relaxation Oscillations.—Many of the simpler biorhythms resemble closely the "relaxation oscillations" of the technologist. These are characterised by the periodic recurrence of sudden jumps. Some material, such as urine in the bladder or a supply of energy in muscle fibre, having gradually piled up, is then suddenly dissipated, or a structure is erected, like the foliage on a tree, which then breaks down. The natural unit of a relaxation oscillation is the relaxation process which is not, in itself, a rhythmic phenomenon but becomes so only by repetition.

A distinction between manifest and hidden periodicity is important in the physiological analysis of biorhythms. It would, for instance, be tempting to consider the daily leaf movements of flowering plants as a sort of pendulum action. However, these movements are actually caused either by differential growth, at different hours, of the dorsal and ventral regions of the leaf joints, or by dorso-ventral changes in osmotic pressure, and these changes are largely independent of whether there is a leaf to move or not.

As yet very little is known of the chemistry of the self-sustained processes which produce rhythms.

Circadian Organisation.

The main difference between a mechanical clock and an organism is probably the difference in the co-operation between the component parts in the two systems. Whereas in a clock the various component parts have distinct and unique functions, and produce oscillations only in combination, in an organism many structures are independently capable of potential oscillations. These internal rhythms differing in period length and phase are synchronised (geared) in a sort of temporal structure both with each other and with the external time cues. When considering events and processes of approximately 24-hours duration we speak of the "circadian organisation" of a living system.

Uses of Biological Clocks.

The possession by an organism of a time geared reference system offers it similar possibilities as the possession of a watch offers to man. Activities can be started without external releasers and often anticipating them. Internal parasites such as the microfilariae (living in the lungs of mammals and man) may swarm into the peripheral blood at hours when the bloodsucking insects, their vectors, are active. Bees used to foraging when nectar flows in a particular species of flowers, will arrive at this crop, without searching for them anew and without being alerted by fellow workers. Another use of the circadian organisation is its involvement in photoperiodicity. The seasonal timing of the flowering of many plants and of sexual activities of many animals depends on the seasonally fluctuating daily light period. It is very likely that the metabolic changes responsible for flowering or mating are somehow interacting with the circadian organisation of the plants and animals concerned. And as the changes in day length never amount to more than a few minutes from one day to the next, we must assume that under normal conditions the relevant "internal clocks" work rather more accurately than one would expect from laboratory experiments.

Practical Applications.

The recognition of temporal organisation carries a multitude of practical implications. Hunters and fishermen must be familiar with the temporal habits of their prey. Horticulturists and animal breeders must learn to manipulate time cues such as light or temperature. Experimental pharmacologists and clinicians must in their activities consider the hour of the day or the month of the year. Night work and the entire existence in the Arctic are up against the constraints of man's circadian organisation and so of course is air travel. And should man altogether escape his terrestrial environment the problems of biological time-keeping will be among his most important worries.

Background to Economic Events

Facts and trends in the economic situation

TABLE OF CONTENTS

Background to Economic Events

INTRODUCTION.

THE aim in this section is to help the ordinary reader to follow economic events as they happen, and to understand the controversy that accompanies them. It is divided into three parts. Part I gives a brief description of the most important problems of economic policy. Part II is concerned with a more detailed survey of developments in British economy up to 1960. In the course of this survey, the specialised terms used by economists are explained, and the attempt is made to present an intelligible summary of the information, facts, and figures relevant to an understanding of economic events. There are five main sub-sections: International Trade and Payments, Production, Employment, and Industry, Incomes, Wages, and Prices, Money, Banking, and Finance, and Economic Aspects of the Public Services. Some suggestions for further reading are given at the end of Part II. Part III is written as shortly before publication as possible, and contains a survey of developments in the British economy since 1960.

I. CENTRAL PROBLEMS OF ECONOMIC POLICY

Unemployment.

Between the wars, unemployment was Britain's most urgent economic problem. The level of unemployment varied with the ups and downs of the trade cycle. Quite the worst slump was that of the early 1930s: in 1932, nearly 3 million workers were without a job. But unemployment remained high even in the best years, and in no year between 1919 and 1939 were there fewer than a million workers unemployed. Economists make a distinction between *structural* unemployment and *cyclical* unemployment. Structural unemployment appears when the structure of industry gets out of line with the pattern of demand for industrial products. In Britain, unemployment was particularly severe and persistent in areas which were dependent on the coal, textile, and shipbuilding industries, and some sections of the engineering industry. These industries had been in the forefront of Britain's industrial growth in the 19th cent., and had contributed greatly to the expansion of exports. In areas like South Wales, Tyneside, Clydeside, and Northern Ireland there was little alternative work for those no longer needed in the "staple" industries: new industries were being built up in the inter-war period, but they tended to be located in the relatively prosperous Midlands and South-East England. Cyclical unemployment appears when there is a general decline in the level of demand for goods and services, which leads to a decline in the employment of workers producing those goods and services. In the slump years unemployment was so high because of a combination of structural and cyclical unemployment. In the best years, unemployment was largely structural.

Unemployment means waste. Men willing to work, who could produce valuable goods and services, are idle, the economy produces fewer goods and services than it is capable of producing. Unemployment also means hardship and low standards of living for those out of work, and for their families.

The avoidance of mass unemployment has been accepted as a primary objective of economic policy by all political parties, and there is a wide measure of agreement on the policies which must be applied to ensure that unemployment on the scale of the 1930s never occurs again. Cyclical unemployment has to be tackled by measures to increase total demand and total spending by consumers, by investors, and by the Government. Structural unemployment has to be tackled by inducing new industries to move into areas where other employment is declining, or by inducing labour to move from those areas to areas where there is a demand for its services.

There have been ups and downs in unemployment in the post-war years, but these have been very slight compared to those of the pre-war years. In most post-war years, less than 2 per cent of the working population was unemployed—a sharp contrast with the 11 per cent for 1937 and the 22 per cent for 1932. But there are still areas of the country where structural unemployment is serious. In Northern Ireland, for example, despite the efforts which have been made to attract new industries, unemployment ranged between 6 and over 10 per cent during the 1950s.

Inflation.

A characteristic of the British economy in post-war years has been a persistent rise in prices and money incomes. For example, between 1950 and 1960, retail prices went up by about 50 per cent, export prices by about 30 per cent, and weekly wage rates by about 70 per cent. In the later years of the 1950s, there was a slowing down of the rate of increase. Between 1956 and 1960, retail prices went up by 8 per cent, export prices by 5 per cent and weekly wages rates by 14 per cent. But after 1960, prices rose faster than in the late 1950s. This inflation of prices and money incomes is considered undesirable for two main reasons. Firstly, it is associated with an arbitrary redistribution of purchasing power. Prices rise for everyone, but some members of the community are better placed than others to secure increases in their money incomes which offset, or more than offset, the rise in the price of the goods and services they buy. The feeling that particular groups are falling behind, in that their money incomes have not risen as fast as those of other groups, is a source of much unrest and discontent. Secondly, and crucially for the British economy, an inflation of prices makes it more difficult to achieve a satisfactory balance of payments. As prices of our exports rise, it becomes harder to sell them in foreign markets, and as imports become cheap in comparison with goods produced at home there is a tendency to buy more of them.

Two main explanations have been advanced to account for the inflation which has occurred. The first stresses the role of an excess of demand or spending power in the economy—of too much money chasing too few goods, and so leading to a rise in prices. The inflationary problem is seen as the obverse of the cyclical unemployment problem: the latter involves a deficiency of spending, and the former an excess. Those who consider an excess of demand (*demand-pull*) to be an important factor in the inflationary situation favour policies designed to reduce purchasing power: for example, the reduction of spendable income by levying higher taxes, or the reduction of spending financed through borrowing by making credit more expensive or more difficult to get. The second stresses the role of an excessive increase in incomes. It is argued that prices have risen mainly because costs have increased faster than productivity (*cost-push*). Those who take this view favour measures to restrain or control increases in wages, profits, rents, and other forms of income. Neither explanation excludes the other. Many would agree that both demand-pull and cost-push factors have contributed—with different strengths at different times—to the inflationary spiral in prices and incomes, and that

measures both to control demand and to restrain or control incomes may be necessary

But it is easier to specify in general terms the measures needed to combat inflation than it is to apply policies which are successful in practice In particular, policy measures to restrain or control wage increases are difficult to reconcile with widely-accepted procedures of collective bargaining

The Balance of Payments.

Britain is heavily dependent on imports This country must import food it cannot produce enough food within its borders to feed its population Many of the raw materials necessary for its industry have to be purchased from abroad Furthermore, some manufactured goods produced in other countries will be purchased because they are cheaper or more attractive than similar goods produced at home All these goods, and our imports of services, have to be paid for in foreign currency Foreign currency is earned by exporting goods and services to other countries It is not, however, considered sufficient to earn enough foreign currency from our exports to pay for our imports The objective is to earn considerably more than that, so that we have a surplus of foreign currency available to pay off external debts, to build up our external assets by investing abroad, to enable us to lend and give aid to underdeveloped countries, and to increase our foreign exchange resources

Since the war, our balance of payments position has been precarious Exports have increased considerably, but so have imports, and the margin of safety has been so narrow that unfavourable turns of events have led to crises in the balance of payments In several years, our earnings from the export of goods and services have not even been sufficient to cover our payments for imports, and in no year has the surplus been as large as is considered necessary With the balance of payments delicately poised even in favourable years, and with corrective action necessary in crisis years, economic policies have been much influenced by our foreign trade problems It is easy to say that most of the problems would disappear, or would become less urgent, if we could achieve a major expansion of our exports But most export markets are highly competitive, and we cannot expect to sell more unless the price, quality, and terms of delivery of our goods and services are at least as attractive as those of our rivals in export markets

Economic Growth.

Taking a longer view, the most important objective of internal economic policy must be to raise the standard of living The standard of living can increase only if more goods and services are produced per head of population In a fully-employed economy, the main source of increased output is a higher productivity—output per person—of the working population

Standards of living in this country have been rising the output of goods and services per head of population increased by about 23 per cent between 1950 and 1960 Nevertheless, many economists are of the opinion that the rate of growth of output and productivity can be, and should be, increased. In particular, they point out that our rate of growth compares unfavourably with that achieved by some other countries The potentialities for higher productivity are enormous The U S A has the highest standard of living in the world; in many industries, output per person employed is twice or more that yet attained in this country In order to achieve a higher level of productivity in this country, more and better machinery and capital equipment will have to be installed, and perhaps even more important, work will have to be planned, organised, and controlled in such a way as to make more effective use of labour and machinery.

Underdeveloped Countries.

Britain and the other developed countries of the world have important responsibilities towards the underdeveloped countries Two-thirds of the world's population live in poverty Some are hungry many more suffer from the effects of malnutrition Debilitating diseases are widespread, and a high proportion of the inhabitants of many underdeveloped countries are illiterate To make matters worse, most of these countries are experiencing a rapid growth of population. Output has to rise as fast as population just to prevent standards of living from falling, and an increase in standards of living requires an even faster growth of output

Few underdeveloped countries can hope to solve the increasing problems they face without active and generous help from developed countries. This help must take many forms Financial aid in the form of grants or loans, in order to place resources at the disposal of underdeveloped countries which they would otherwise not be able to obtain, technical aid to assist in the solution of the many technical problems which have to be solved, trading policies which do not hinder underdeveloped countries from getting the imports they need or from selling their exports—these are all activities in which Britain must play her part Most especially, of course, Britain must contribute to the development of the underdeveloped countries of the Commonwealth.

The Inter-relationship of Economic Problems.

Each of the problems briefly described above is extremely complex The difficulties of achieving successful solutions are further aggravated by the fact that the problems are inter-related in such a way that measures which are helpful for one problem can make others more difficult to solve For example, a reduction of purchasing power might be considered helpful in the control of inflation, and might ease balance of payments problems by reducing—or slowing down the increase of—imports But it could also lead to an increase in unemployment, and to a slowing down in the rate of growth of the economy Or again, a reduction in aid to underdeveloped countries could make it easier to balance our external accounts, but such action could hardly be reconciled with our responsibilities towards underdeveloped countries In the next section, particular aspects of the British economy up to 1960 are considered in some detail, the final section discusses the main features of the development of the economy since 1960.

II. SURVEY OF THE BRITISH ECONOMY UP TO 1960

1. INTERNATIONAL TRADE AND PAYMENTS.

Imports and Exports.

In 1959 Britain bought from abroad goods to a value of £3,988 million, or about £77 per head. Food is the largest item in this bill, accounting for £1,522 million Fuel, largely oil, cost about £468 million, basic materials for industry £931 million, and manufactured goods (a category that includes a large number of semi-manufactured goods bought for further processing) £1,053 million This last category of imports had increased sharply in the previous five years; in 1954 manufactured goods cost only £679 million in a total import bill of £3,374 million. Some of the more important individual items are shown in the table.

Most of these goods are paid for by exports of manufactured goods, which accounted in 1959 for £2,813 million out of a total value of exports of £3,330 million. Any list of such goods would be almost endless, as nearly all British industries do

some exporting; again some of the more important items are shown in the table. In addition, some £131 million of imports were re-exported without being worked on in this country.

The Balance of Visible Trade.

In the table the value of imports is much higher than that of exports; but this, the normal method of valuation in the trade returns, gives an unfair picture Imports are valued c i f (cost, insurance, and freight), *i e*, at the prices when loaded abroad, plus the cost of transporting them to Britain, while exports are valued f o b (free on board), *i e.*, at the prices when loaded in British ports So in order to get a fair picture of the balance of trade, the cost of transport and insurance must be subtracted from the value of imports When both imports and exports are valued on the same f o b basis, the deficit is smaller: in 1959, the value of imports exceeded that of exports by £60 million The position of a *deficit* on the *balance of visible trade* is the normal one Only in 1958 was a *surplus* achieved on visible trade.

In the table figures are given for the balance of visible trade since 1946. In one year, 1951, imports exceeded exports by £750 million, and in both 1947 and 1955 there were substantial deficits. In the next table we show figures to illustrate the sources of the year-to-year changes in the balance. Each figure shows the percentage change on the previous year, for instance, in 1951 the sharp deterioration may be attributed to the rise in imports, which rose 16 per cent in volume and 34 per cent in price, giving a total increase in value of over 50 per cent The rise was far from compensated by the rise in export value of under 25 per cent, the result of a much smaller price rise of only 19 per cent for an almost unchanged volume of exports

The Terms of Trade.

Thus the deficit for 1951 was due almost equally to two factors—a sharp rise in the volume of imports and a sharp deterioration in the *terms of trade*. The terms of trade are obtained by dividing the change in the price of imports by the change in the price of exports, and therefore measure what quantity of exports would be needed to buy the same quantity of imports as in a previous year. Thus the figure of 12 per cent for the deterioration in the terms of trade between 1950 and 1951 means that in 1951 12 per cent more exports by

volume would have been needed to buy the same amount of imports as in 1950

Up to 1951 the terms of trade turned against Britain every year As a result, over the whole period an 80 per cent rise in the volume of exports was not nearly sufficient to pay for the 50 per cent rise in the volume of imports But after 1951 the terms of trade moved nearly as consistently in Britain's favour. Price-changes were much smaller, but over the period 1951–59 import prices fell by 13 per cent and export prices rose by 9 per cent, so that there was a net improvement in the terms of trade of 25 per cent This permitted an improvement in the balance of visible trade despite the fact that the volume of exports did not rise as much as the volume of imports

The Volume of Visible Trade.

Superficially, therefore, it would appear that an improvement in the terms of trade was good for Britain's balance of visible trade in the 1950s This, in turn, might seem to imply that faster inflation in this country, leading to a more rapid increase in export prices, would be helpful to the balance of visible trade This argument is false, and to see why it is false we have to consider the relationship between prices and volumes in international trade If the prices of our export goods rise faster than the prices of our competitors in overseas markets, it will become progressively more difficult to sell our exports If the prices of the goods we import rise slower than the prices of home-produced goods, it will become progressively more attractive to buy goods produced abroad Thus in the longer run, an improvement in the terms of trade may be associated with a faster rise in the volume of imports than in the volume of exports It is no accident that over the period of worsening terms of trade the volume of our exports went up faster than the volume of our imports, and that over the period of improving terms of trade the volume of our exports went up slower than the volume of our imports For a time, it is true, an improvement in the terms of trade may more than offset the slower increase in the volume of exports, so that the balance of trade improves—as it did in the 1950s But in the longer run, improving terms of trade may be more a hindrance than a help to the balance of trade, and an improvement in the terms of trade caused by inflation in the home economy would be particularly dangerous One of the most ominous signs in the 1950s was a persistent fall in Britain's share of world trade Her competitors in export markets—and particularly Germany and Japan—were more successful in expanding their exports.

It will be noted from the table that the largest deficits in visible trade—in 1947, 1951, and 1955—occurred in years when there was a sharp increase in the volume of imports The improvement which occurred in the years after each of these crisis years was in part attributable to a fall, or slower growth, in import volume The implication is that some part of the additional imports in crisis years was not used in those years, but added to stocks. The fall or slower growth in imports in the years after was in part attributable to the running down of stocks accumulated in crisis years Changes in holding of stocks have an important part in the explanation of ups and downs in the economy after the war the increase and subsequent running down of stocks has been described as an *inventory cycle* to distinguish it from the more severe and pervasive *trade cycle* of pre-war years Since some of the materials and goods going into stock are imported, the inventory cycle has had a direct impact on the balance of visible trade, an impact which was particularly serious when, as in 1951, additional imports were bought at sharply increased prices

Invisible Trade, and the Current Balance of Payments.

For every post-war year except 1958, visible imports exceeded visible exports, so that there was a deficit on visible trade This deficit was offset by a surplus on *invisible transactions*, as they are called This surplus derives from four main groups of transactions The first covers receipts from non-residents, *less* payments to non-residents, for services such as shipping and insurance The second covers receipts from foreign governments in respect of military bases in this country, *less* payments by this country in respect of military bases abroad The third covers receipts of gifts and grants made to this country, *less* gifts and grants—e g grants to some Commonwealth

countries—made by this country. The fourth covers receipts of interest, dividends, and profits earned on overseas investment, *less* interest, dividends, and profits paid out on foreign investment in this country. The table shows that in most years, the surplus on all these transactions taken together exceeded the deficit on visible trade, so that Britain earned a surplus on the *current balance of payments*. During the 1950s, it was only in the two years of exceptionally large deficits on visible trade—1951 and 1955—that there was a deficit in the current balance of payments. In the later years of the 1950s, however, there was a distinct tendency for the surplus from invisible trade to decline. Net earnings from shipping services fell: Government military expenditure abroad and grants to other countries increased; defence aid to this country fell. Britain could no longer rely on such a substantial surplus on invisible transactions to offset deficits on visible trade: but surpluses on the current balance of payments continued because the balance of visible trade improved markedly.

The Current Balance of Payments by Regions.

All the figures presented so far refer to Britain's trade with the external world as a whole. More detailed figures are also available showing the results of trade between this country and groups of other countries: data for 1959 are shown in the table. Almost 40 per cent of visible imports and exports came from or went to the countries of the overseas sterling area—comprising the Colonial Territories, independent Commonwealth countries other than Canada, British Protected States in the Persian Gulf, and a few other countries such as Burma. One reason for Britain's declining share in world trade is that trade within the sterling area has been growing less rapidly than world trade as a whole. Rather less than 30 per cent of our visible trade was done with Western Europe, and rather less than 20 per cent with North America. It will be noted that the current balance of payments surplus of £139 million was made up of a large surplus with sterling area countries, partially offset by a deficit with all other countries taken together. A deficit with non-sterling countries had persisted throughout the 1950s.

The Long-term Capital Account.

We have seen that Britain earned a surplus on its current balance of payments in most years of the 1950s. Yet it is not sufficient for this country to avoid deficits on its current account. The objective is to earn a substantial surplus in order to finance investment in and lending to other countries—particularly Commonwealth countries, to repay debts to foreign countries which have been incurred, and to build up the reserves of gold, dollars, and other currencies which can help to tide us over difficult periods. In fact, the objective of the Government in the late 1950s was to earn current account surpluses of £300–£400 million in normal years: and a surplus of this magnitude was only achieved in the exceptionally favourable year 1958.

Throughout the 1950s we had a considerable and growing deficit on long-term capital account, which means that we were investing in and lending to other countries more than other countries were investing in and lending to this country. As with current transactions, there were considerable regional differences. The usual pattern was of a heavy deficit in long-term capital transactions with the sterling area, and a much smaller deficit in long-term capital transactions with the rest of the world. In 1959, our deficit with the sterling area accounted for £224 million of the total deficit on long-term capital account of £317 million (excluding the subscription of £236 million to the International Monetary Fund: see G11 (1)). As was usual throughout the 1950s, most of the current balance of payments surplus with the sterling area was used to finance a flow of long-term capital from this country to sterling area countries.

Monetary Movements.

Taking current and long-term capital transactions together, there was in 1959 an adverse balance of £178 million: this was the amount by which the deficit of long-term capital account (again excluding the contribution to the I.M.F.) exceeded the surplus on current account. This balance has to be financed either through an increase of liabilities (for example, an increase in sterling balances held by foreigners) or by a reduction in assets (for example, a reduction in the gold and dollar reserves). Such "financing" transactions are important to an understanding of our balance of payments problems, but a complete description cannot be attempted here. We will confine ourselves to two of the most important sources of "finance": the sterling balances and the foreign exchange reserves.

The Sterling Balances.

Sterling is an international currency, and governments and individuals may hold balances in sterling for many reasons. Sterling area countries reckon to keep a high proportion of their international trade reserves in the form of sterling balances. Sterling balances will also be held to the extent that they are considered to be a convenient, profitable, or safe way of holding liquid assets. It may be convenient to hold sterling to finance trading transactions, because sterling is widely acceptable in settlement of trading debts. It may be profitable to hold sterling balances if the rate of interest paid on balances in London is higher than that paid in other financial centres. And it may be considered safe to hold sterling if the chances of a sterling devaluation (which would automatically reduce the value of the balances in terms of any currency which did not devalue) are thought to be remote.

An increase in sterling balances enables this country to finance an adverse balance on current plus long-term capital account without increasing other liabilities or reducing our reserves. Conversely, a reduction in sterling balances can impose a drain on reserves even if there is no adverse balance on the current plus long-term capital account.

At the end of 1959, sterling balances held by non-residents amounted to over £4,200 million,

£150 million higher than they had been in 1950. Nearly two-thirds of this amount was held by sterling area countries These holdings represent a major portion of the foreign exchange reserves of the overseas sterling area countries They can, of course, be drawn upon to finance deficits in the balance of payments of sterling area countries Total holdings fluctuated during the 1950s, but they were somewhat higher at the end of 1959 than they had been at the end of 1950, even though some countries had substantially reduced their holdings In the longer run, it is to be expected that the holdings of sterling area countries will be reduced Many sterling area countries are relatively underdeveloped, and an increasing number of countries will probably find it necessary to run down their sterling balances in order to finance a part of the imports which will be required for their development programmes India, for example, has used most of the sterling holdings she accumulated during the war for this purpose

Sterling holdings outside the sterling area, and particularly the unofficial holdings, are very volatile, in that they may be withdrawn very rapidly if for any reason it is thought less profitable or less safe to hold sterling than some other currency There was, for example, a large withdrawal of balances in 1956, the year of the Suez affair

Foreign Exchange Reserves.

The gold and convertible currency reserves can be used to finance any foreign currency payments which cannot be financed in any other way· they are a last line of defence in international trade The reserves held in London belong to the sterling area as a whole, and not just to this country Members of the sterling area are willing to pay into these central reserves some or all of their net earnings of gold and convertible currencies, in exchange for sterling balances They do this on the understanding that they can, should they wish to do so, call upon the central reserves by exchanging sterling balances for gold and convertible currencies The central reserves of gold and foreign currencies amounted to rather less than £1,000 million at the end of 1959, a level which, though higher than in many previous post-war years, was felt to be quite inadequate There are bound to be imbalances in international trade and payments, and a very important function of international trade reserves is to tide over temporary imbalances by increasing reserves in favourable periods, and running down reserves in unfavourable periods If reserves are not sufficient to withstand temporary pressures, measures to protect the reserves will have to be taken—e g, raising bank rate and tightening up monetary policies generally—which might not have been necessary if reserves had been at a more adequate level

Fortunately, our membership of the International Monetary Fund (see G11 (1)) gives us the right to draw on the resources of the Fund· this is an important additional source of foreign exchange in times of stress At the time of the Suez affair in 1956, we were able to make a large drawing from the Fund, and as a consequence that crisis had a less disrupting effect on the economy and the balance of payments than would otherwise have been the case

The Balance of Payments: Good and Bad Years.

Balance of payments statistics for five years selected from the 1950s are shown in the table. Two were good years, the other three were crisis years The chief contrast between 1951 and 1955 on the one hand, and 1954 and 1958 on the other, is to be found in the balance of visible trade The deficits in the former years were so great that even

THE BALANCE OF PAYMENTS IN SELECTED YEARS.
(£ million)

	Good Years 1954.	Good Years 1958.	Crisis Years 1951	Crisis Years 1955	Crisis Years 1957
Balance on visible trade	−195	+91	−749	−356	− 27
Balance on invisible trade	+406	+254	+330	+283	+256
Current balance of payments	+211	+345	−419	− 73	+229
Balance on long-term capital payments	−240	−259	n a	−183	−183
Balance on current account *plus* long-term capital payments	− 29	+ 86	n a	−256	+ 46
Change in sterling balances	+175	+ 58	+ 83	−134	−173
Change in foreign exchange reserves	+ 87	+284	−344	−229	+ 13

allowing for the surplus on invisible trade, there was a deficit on current account—small in 1955, and very large in 1951. On top of these deficits on current account, there was as usual a deficit on long-term capital payments, so that a heavy adverse balance on current *plus* long-term capital account had to be financed: in both years there were considerable reductions in the foreign exchange reserves In 1954 and 1958, however, the surpluses on current account covered, or nearly covered, the deficit on long-term capital payments; foreign exchange reserves increased in both years

The crisis of 1957 was very different from those in 1951 and 1955 Indeed, at first glance, there seems to be no reason for regarding 1957 as a crisis year at all There was a substantial surplus on current account which was more than sufficient to cover the deficit on long-term capital payments, and the foreign exchange reserves rose slightly. Yet this was a year in which crisis measures—including the raising of Bank Rate to the very high level of 7 per cent—were taken to protect the £ A clue to the difficulties of that year is provided by the sharp fall in sterling balances. 1957 was a difficult year for many countries in the overseas sterling area, and there was a sharp fall in their sterling balances But this withdrawal cannot of itself explain the severity of the crisis. Moreover, the magnitude of the fall in total balances over the whole year gives a misleading impression Total sterling balances actually rose over the first half of 1957, and rose again at the end of the year as confidence in sterling recovered after the crisis measures. In the few months in between, there was a massive withdrawal of sterling In large part, this was a withdrawal of speculative funds. It was widely believed that the German Government would appreciate the mark (i e , raise the value of the mark in terms of other currencies, the opposite to devaluation) so that speculators thought that it would be profitable to hold marks instead of sterling The speculative outflow was stemmed partly by announcements by the German Government that no appreciation was contemplated, and partly by the increase in the rate of interest in this country which made the holding of sterling balances more attractive In 1957, the trade and long-term investment position was relatively favourable that a crisis nonetheless occurred underlined the vulnerability of sterling to speculative pressures

Throughout the 1950s, in fact, the balance of payments position of this country was far from secure As a consequence, economic policies were much influenced by balance of payments considerations, and many hold the view that the growth of the economy as a whole was hampered by measures imposed primarily to protect the balance of payments The main need at the end of the 1950s was much the same as that at the beginning to achieve an expansion of exports relative to imports so as to secure larger surpluses on the current balance of payments

In the following sections, we examine certain aspects of the framework within which international trade and payments took place in the 1950s.

Exchange Controls and Convertibility.

A currency is fully convertible if it can be freely exchanged for any other currency, or for gold, at the ruling official rates of exchange Exchange controls impose restrictions on convertibility by limiting the powers of holders of a currency to exchange their holdings for other currencies or gold at the official rate of exchange. For many years after the war, for example, there was a world-wide shortage of dollars if sterling had been convertible, there would have been a rush to convert sterling into dollars, with the consequence that the dollar reserves of the sterling area would soon have been exhausted. In fact, a premature attempt to establish sterling convertibility in 1947 led to such a drain on reserves that strict exchange controls had to be re-imposed

Exchange controls on residents can be enforced by requiring that earnings of foreign currencies (e g , the proceeds from the sale of exports) be handed over to the exchange control authority—the Bank of England acts as Government's agent—in exchange for sterling, and by permitting the exchange of sterling for foreign currencies (e g , to enable the purchase of imports) only for transactions approved by the exchange control authority. Non-resident holders of sterling were, however, able to circumvent exchange controls by buying or selling in the "free" markets established in certain overseas financial centres The rates of exchange in these markets often diverged substantially from the official rates of exchange, and the "free" exchange rate for sterling was often well below the official rate An important move towards wider convertibility was made in 1955, when the Bank of England was given power to operate in the "free" markets by selling sterling in exchange for foreign currencies or gold, or by selling foreign exchange or gold in exchange for sterling The Bank of England operated in such a way that the free market rate for sterling remained close to the official rate: and so long as it did so sterling held by non-residents was in effect convertible at the official rate of $2 80. During periods when sterling was weak, operations to support sterling involved heavy sales of gold and currencies from the reserves, and much of the loss of reserves in 1956 and 1957 was attributable to operations in the free markets. Encouraged by the greatly improved position of sterling in 1958, the Government made sterling held by non-residents fully convertible in December 1958, thus officially recognising the convertibility which had in fact been in operation for the previous three years. Residents, however, continued to be subject to exchange controls Several other Western European countries declared their currencies convertible at the same time

Convertibility, of course, makes it easier for funds to move into and out of sterling and other convertible currencies, and during the later years of the 1950s international movements of funds became much more important than they had been in earlier post-war years Funds which can easily be shifted from one currency to another are particularly sensitive to rumours about possible changes in exchange rates, but provided that there is confidence that exchange rates will not in fact be changed, they tend to move towards those financial centres in which rates of interest are higher For this reason, changes in bank-rate and other measures affecting interest rates can have a substantial effect on international monetary movements

Import Controls and Tariffs.

Import controls impose limitations on the quantity or value of goods which are permitted to enter a country: tariffs are duties levied on imported goods so that the price of those goods to consumers in a country is higher than the price received by the foreigners supplying the goods In the early post-war years, this country maintained strict import controls over a wide range of goods These were gradually dismantled, until in 1959 the last remaining import controls on goods from the dollar area were abandoned The only import controls remaining were on certain goods—such as habit-forming drugs—which it would be dangerous or undesirable to leave uncontrolled, and on certain goods—the most important of which were some agricultural products and textiles from the Far East—to give a measure of protection to British producers.

All countries impose tariffs. Some tariffs are primarily intended to raise revenue for the Government, and others are primarily intended to protect home industries by raising the price of competing goods from abroad. Needless to say, any proposal to lower a tariff will be opposed by those who have benefited from the restriction on free trade The rights of countries to raise tariffs, or to operate tariffs in a discriminatory way (i e , to offer lower tariffs on goods from some sources than on similar goods from other sources), are closely circumscribed by the rules of GATT The object of the *General Agreement on Tariffs and Trade* is to work towards free trade, especially through a reduction of tariffs. During the 1950s GATT held several major Conferences at which countries bargained for a reduction in the tariffs imposed by other countries in return for reduction in the tariffs which they themselves imposed Some modest success attended these efforts but the most significant moves towards freer trade in the 1950s were on a regional basis

The European Common Market and the European Free Trade Area.

At the end of the 1950s, Europe was divided into two major trading groups The Common Market, or *European Economic Community* (EEC) comprised six countries Belgium, France, Holland, Italy, Luxembourg, and West Germany The Treaty of Rome (ratified in 1958) envisaged a rapid reduction of tariffs on industrial goods traded between member countries, the formulation of common agricultural policies, the establishment of a uniform external tariff on imports into Common Market countries from the outside world, and a movement towards a closer integration of economic and political policies In the protracted negotiations which led up to the Treaty of Rome, Britain had argued in favour of a looser form of association in a Free Trade Area, involving, in the main, a reduction of tariffs on trade within the area Britain felt that her special relationships with Commonwealth and Sterling Area countries would be compromised if she accepted the principle of a common external tariff, that her agricultural policies were very different from those of some European countries, so that there would be severe difficulties in subscribing to a common agricultural policy, and that proposals for the closer integration of economic and political policies should be considered very cautiously In the end, agreement could not be reached with the six countries who signed the Treaty of Rome The idea of a Free Trade Area, however, found support from other countries, and the *European Free Trade Association* (EFTA) was set up with a membership of seven countries, Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom As will be obvious from a glance at a map, the EFTA covers a much less compact group of countries than the EEC

The International Monetary Fund and the International Bank.

The *International Monetary Fund* was set up after the war with the objective of working towards free trade at stable exchange rates Under the original agreement setting up the Fund, members agreed to make their currencies convertible into other currencies and gold at fixed rates of exchange, and agreed not to impose exchange or import controls without the permission of the Fund Any alteration in the rates of exchange by more than 10 per cent also requires the permission of the Fund For many years after the war, the imbalances in world trade -and particularly the acute shortage of dollars—were such that many countries had to invoke the clauses in the agreement which permitted them to impose restrictions during a "transitional" period Although there is still a long way to go before the Fund reaches its objectives, considerable progress towards them was made during the 1950s The progressive relaxation of exchange and import controls by this country was paralleled in some other countries and most of the currencies important in world trade and payments were declared convertible

An important function of the Fund is to make foreign exchange resources available to members who run into balance of payments difficulties Each member country makes a deposit (called its quota) partly in gold, and partly in its own currencies, with the Fund The size of the deposit is fixed in relation to the country's share in world trade In return, it is granted certain automatic drawing rights, which entitle it to borrow foreign currencies from the Fund Furthermore, the Fund has power to make larger loans, and to grant stand-by credits to be drawn on if required Before the Fund will make such loans and credits available, it has to be satisfied that the borrowing country is taking appropriate action to correct the balance of payments disequilibrium In 1956, at the time of the Suez crisis, Britain negotiated a loan of $561 million and an even larger stand-by credit The stand-by credit was not required, and the loan enabled this country to ride out the crisis without a severe loss of reserves Because it was felt that the resources of the Fund were inadequate in relation to international monetary movements, quotas were raised by 50 per cent in 1959, and each member country paid an additional subscription into the Fund.

The International Bank has the primary function of making funds available to assist development in underdeveloped countries Member nations agree to subscribe quotas—fixed in much the same way as the quotas for the Fund—to the Bank In fact, only a small proportion of the quotas has been called up by the Bank the major part of the Fund's resources are borrowed—on the security of the remainder of the quotas—in financial centres· particularly in New York, but also in London and elsewhere

Usually, loans are made to finance specific projects of investment in underdeveloped countries, and the Bank will normally make a loan only if it is satisfied that the investment will yield a revenue sufficient to enable the payment of interest on the loan, and the repayment of the sum lent By mid-1959, the Bank had agreed to make development loans totalling $4 billion (about £1,400 million), though the total outstanding was considerably lower because loans made in earlier years had been partially repaid, and some loans agreed had not yet been disbursed Thus a sizeable amount of lending was channelled through the Bank, but it was clear that some projects of great value to underdeveloped countries could not be financed in this way, because they would not yield returns quickly enough or large enough to meet the Bank's stringent requirements for interest and repayment Accordingly, a new institution, the *International Development Authority*, was set up in 1960 with the power to make loans at low rates of interest and with more generous repayment conditions Unfortunately, the resources placed at the disposal of the Authority were very limited

The Needs of Underdeveloped Countries.

Two-thirds of the world's population live in dire poverty—a poverty which can scarcely be imagined by those accustomed to the standards of living attained in the relatively few developed countries of the world The alleviation of this poverty is widely recognised as the most important economic -and indeed political- -task of the second half of the twentieth century
